The wood is very ponderous, of a close compact texture; the outer part is of a yellow colour. the heart of a deep blackish green, or variegated with black, green, pale, and brown colours: the bark is thin, smooth, externally of a dark greyish hue: both have a lightly aromatic, bitterish, pungent taste; the bark is somewhat the weakest. The resin (which exsudes from incisions made in the trunk of the tree) is brought to us in irregular masses, usually friable, of a dusky greenish, and sometimes of a reddish cast, with pieces of the wood among them: its taste is more acrid and pungent than that of the wood or bark.

Their general virtues are those of a warm, stimulating medicine: they strengthen the stomach and other viscera; and remarkably promote the urinary and cuticular discharge: hence in cutaneous defedations, and other disorders proceeding from obstructions of the excretory glands, and where sluggish serous humours abound, they are eminently useful: rheumatic and other pains have often been relieved by them. The resin is the most active of these drugs; and the efficacy of the others depends upon the quantity of this part contained in them: the resin is extracted from the wood in part by watery liquors, but much more perfectly by spiritous ones; the watery extract of this wood, kept in the shops, proves not only less in quantity, but considerably weaker than one made with spirit. This last extract is of the same quality with the native resin, and differs from that brought to us only in being purer. The gum, or extracts, are given from a few grains to a scruple or half a dram; which last dose proves for the most part considerably purgative.

GUALEOR, a city of the Hither India, and the capital of the province of Gualeor, situated forty miles south of Agra: E. long. 79°, and N. lat. 26°.

GUAM, the chief of the Ladrone-islands, in the Pacific ocean: E long. 140°, and N. lat. 14°.

GUANIHANI, or St SALVADOR, now called Catt-island, one of the Bahama islands in the Atlantic ocean, in North America: W. long. 76°, N. lat. 24°.

GUANUCO, a town of Peru, in South America, one hundred and eighty miles north-east of Lima: W. lon. 75° 15′, and S. lat. 10°.

GUARANTY, in matters of polity, the engagement of mediatorial or neutral states, whereby they plight their faith, that certain treaties shall be inviolably observed, or that they will make war against the aggressor.

GUARD, in a general sense, signifies the defence or preservation of any thing; the act of observing what passes, in order to prevent surprize; or the care, precaution, and attention, we make use of, to prevent any thing happening contrary to our intention or inclinations.

GUARD, in the military art, is a duty performed by a body of men, to secure an army or place from being surprised by an enemy.

Advanced GUARD, is a party of either horse or foot, that marches before a more considerable body, to give notice of any approaching danger.

Artillery GUARD, is a detachment from the army, to secure the artillery: their corps de garde is in the front, and their centries round the park. This is a forty-eight-hours guard: and upon a march, they go in the front and rear of the artillery, and must be sure to leave nothing behind; if a gun or waggon break down, the captain is to leave a part of his guard to assist the gunners and matrosses in getting it up again.

Corps de GARDE, are soldiers entrusted with the guard of a post, under the command of one or more officers.

Forrage-GUARD, a detachment sent out to secure the forragers, which are posted at all places, where either the enemy's party may come to disturb the forragers, or where they may be spread too near the enemy, so as

es to be in danger of being taken. They confift both of horfe and foot, and muft ftay at their pofts till the forragers all come off the ground.

Grand GUARD, three or four fquadrons of horfe, commanded by a field officer, pofted at about a mile and a half from the camp, on the right and left wings, towards the enemy, for the fecurity of the camp.

Main GUARD, that from whence all the other guards are detached.

Picquet-GUARD, a good number of horfe and foot always in readinefs in cafe of an alarm: the horfe are all the time faddled, and the riders booted. The foot draw up at the head of the battalion, at the beating of the tattoo; but afterwards return to their tents, where they hold themfelves in readinefs to march, upon any fudden alarm. This guard is to make refiftance, in cafe of an attack, till the army can get ready.

Quarter-GUARD, a fmall guard, commanded by a fubaltern officer, pofted by each battalion, about an hundred yards before the front of the regiment.

Rear-GUARD, that part of the army which brings up the rear, which is generally the old grand-guards of the camp. The rear-guard of a party is fix or eight horfe, that march about four or five hundred paces behind the party. The advanced-guard of a party on its going out, make the rear-guard on its return.

Standard-GUARD, a fmall guard, under a corporal, out of each regiment of horfe, and placed on foot, in the front of each regiment.

Van GUARD, that part of the army which marches in the front.

GUARD is more particularly underftood of a foldier detached from a company or corps,, to protect, detain, or fecure any perfon, *&c.*

GUARDS, are alfo troops kept to guard the king's perfon, called alfo royal-guards, life-guards, gardes du corps, *&c.* Thefe are diftinguifhed into horfe, foot, granadiers, and yeomen.

The Englifh horfe-guards are diftinguifhed by troops, and the foot-guards by regiments.

Yeomen of the GUARDS. See YEOMAN.

The French GUARDS are divided into thofe within, and thofe without the palace: the firft confifts of the guards du corps, or body-guard, which confifts of four companies of horfe, the firft of which companies was anciently Scotch, and ftill retains the name, though it now confifts wholly of Frenchmen. The guards without, are the gens d'armes, light horfe, mufqueteers, and two other regiments, the one of which is French and the other Swifs. See GENDARMES.

GUARD, in fencing, is a pofture proper to defend the body from an enemy's fword.

GUARDIAN, in law, a perfon who has the charge of any thing; but more commonly it fignifies one who has the cuftody and education of fuch perfons as have not fufficient difcretion to take care of themfelves and their own affairs, as children and ideots.

GUBEN, a town of Germany, in the circle of Upper Saxony: E. long. 15°, and N. lat. 51° 50′.

GUDGEON, in ichthyology. See GOBIUS.

GUENGA, a great river of the Hither India, which rifing in the mountains of Balagate, runs north-eaft, and falls into the weft branch of the river Ganges in Bengal.

GUERET, a town of France, in the province of Lionois: E. long 2°, and north lat. 46° 5′.

GUERNSEY, or GARNSEY, an ifland in the Englifh channel, on the coaft of Normandy, fifty-eight miles fouth of Portland, in Dorfetfhire, and twenty two weft of cape la Hogue, in Normandy; about ten miles long and as many broad. containing ten parifhes. The natives, who fpeak French, are ftill governed by the Norman laws, but are fubject to England.

GUIAQUIL, a city and port-town of Peru, fituated near the Pacific ocean: W. long. 80°, and S. lat. 3°.

GUIARA, a port-town on the Caracoa-coaft, in Terra Firma, in South America: W. long. 66°, and N. lat. 10° 35′.

GUIDON, a fort of flag or ftandard, borne by the king's life-guards; being broad at one extreme, and almoft pointed at the other, and flit or divided into two.

GUIDON, alfo denotes the officer who bears the guidon. He is the fame in the horfe-guards that the enfign is in the foot. The guidon of a troop of horfe takes place next below a cornet.

GUIENNE, a province of France, bounded by the Orleannois on the north, by Gafcony, from which it is feparated by the river Garonne, on the fouth, by Languedoc on the eaft, and by the bay of Bifcay on the weft.

GUILANDINA, in botany, a genus of the decandria monogynia clafs. The calix confifts of one leaf; the petals are inferted into the neck of the calix; and the capfule is angular, and contains from three to fix cells. There are five fpecies, none of them natives of Britain.

GUILD, a fraternity or company. As to the original of thefe guilds or companies, it was a law among the Saxons, that every freeman of fourteen years of age fhould find fureties to keep the peace, or be committed; upon which the neighbours enter into an affociation, and become bound for each other, either to produce him who committed any offence, or to make fatisfaction to the injured party; in order to which they raifed a fum among themfelves, which they put into a common ftock; out of which they, upon occafion, made a pecuniary compenfation according to the quality of the offence committed. Thefe guilds are now companies joined together with laws and orders made by themfelves, by the licence of the prince.

Dean of Guild, in Scots law, a magiftrate of a royal borough, who is head of the merchant-company. See SCOTS LAW, title 4.

GUILDFORD, or GULDEFORD, a borough-town of Surry, fituated on the river Wye, thirty miles fouth-weft of London. It fends two members to parliament.

GUILLESTRE, a city of France, in the province of Dauphiny: E. long. 6° 20′, and N. lat. 44° 45′.

GUINEA, a large country of Africa. fituated between 15° E. and 15° W. long. and between 4° and 10° N. lat.

lat. The British, Dutch, French, and other nations, have forts and factories on this coast.

GUINEA is also the name of a British gold coin, value 1 l. 1 s. Sterling.

GUINEA-PIG, in zoology. See MUS.

GUIPUSCOA, the north-east division of the province of Biscay, in Spain, situated on the confines of Navarre in France.

GUIRA, or GUARA GUAINUMBI, in ornithology, the Brasilian name of the green ispida, with a crested head and very long tail.

GUISE, a town of France, in the province of Picardy, situated on the river Oyse: E. long $3^{\circ} 36'$, and N. lat. $49^{\circ} 55'$.

GUITAR, GUITARRA, a musical instrument of the string-kind, with five double rows of strings, of which those that are bass are in the middle, unless it be for the burden, an octave lower than the fourth.

This instrument was first used in Spain, and by the Italians.

GULA, or GOLA, in architecture, a wavy member, the contour of which resembles the letter S, which the Greeks call cymatium, and our architects an ogee. See ARCHITECTURE.

GULES, in heraldry signifies the colour red, which is expressed in engraving by perpendicular lines falling from the top of the eschutcheon to the bottom. See Plate CI. fig. 6.

It is the first of all colours in armory, and was formerly prohibited to be worn by any person in his coat-armour, unless he were a prince, or had a permission from him. This colour is a symbol of charity, valour, and generosity, and represents blood colour, and true scarlet.

The Romans, according to Spelman, painted the bodies of their gods, and generals that triumphed, with vermilion; and under the consuls, their soldiers were clad in red; hence called russati. And we are told, that the Lacedemonians wore scarlet, to prevent seeing the blood issue from their wounds. Those who bear this colour are obliged to relieve such as are in danger of being oppressed by injustice.

GULL. See LARUS.

GULPH, or GULF, in geography, a part of the sea, almost surrounded by lands, the gulph of Mexico, gulph of Venice, of Lyons, *&c.*

GUM, in pharmacy, a concreted vegetable juice, which transudes through the bark of certain trees, and hardens upon the surface.

GUM ARABIC. See *Gum* ARABIC.

GUM SENECA, is a gum extremely resembling gum arabic. It is brought to us from the country through which the river Senega runs, in loose or single drops, but these are much larger than those of the gum arabic usually are; sometimes it is of the bigness of an egg, and sometimes much larger: the surface is very rough, or wrinkled, and appears much less bright than the inner substance, where the masses are broken. It has no smell, and scarce any taste. We are not acquainted with the tree which produces it. The virtues of it are the same with the gum arabic; but it is rarely used in medicine, unless as mixed with the gum arabic: the dyers and other artificers consume the great quantities of it that are annually imported here. The negroes dissolve it in milk, and in that state make it a principal ingredient in many of their dishes; and often feed on it thus alone.

GUM TRAGACANTH. See TRAGACANTH.

GUM MANNA. See MANNA.

Other substances known by the name of gums, are as follow.

GUM ALOES, a preparation of aloes, as set down in the London Dispensatory.

It is made thus: Take of succotrine aloes, four ounces; of water, a quart: boil the aloes till it is dissolved as much as may be; and set all by for a night: the resin will be precipitated to the bottom of the vessel; the liquor poured off and strained, being evaporated, will have the gum. The intention of this separation of the resin, is to procure, in the gum, a medicine less purgative, but more agreeable to the stomach, than the crude aloes.

GUM AMMONIAC. See AMMONIAC.

GUM ELEMI. See ELEMI.

GUM GUAIACUM. See GUAIACUM.

GUM LACCA. See LACCA.

GUMS, in anatomy, See ANATOMY, p. 305.

GUN, a fire arm, or weapon of offence, which forcibly discharges a ball, shot, or other offensive matter, thro' a cylindrical barrel, by means of gun-powder. See GUN-POWDER.

Gun is a general name, under which are included divers or even most species of fire-arms. They may be divided into great and small.

Great guns, called also by the general name cannons, make what we also call ordinance, or artillery; under which come the several sorts of cannons, as cannon-royal, demi-cannon, *&c.* Culverins, demi-culverins, sakers, minions, falcons, *&c.* See CANNON.

Small guns include musquets, musquetoons, carabines, blunderbusses, fowling-pieces, *&c.* See MUSQUET, *&c.*

Pistols and mortars are almost the only sort of regular weapons, charged with gun-powder, that are excepted from the denomination of guns. See PISTOL and MORTAR.

The advantage of large guns, or cannons, over those of a smaller bore, is generally acknowledged. Robins observes, that this advantages arises from several circumstances, particularly in distant cannonading. The distance to which larger bullets fly with the same proportion of powder, exceeds the flight of the smaller ones, almost in proportion to their diameters; so that a thirty two pound shot, for instance, being somewhat more than six inches in diameter, and a nine pound shot but four inches; the thirty-two pound will fly near half as far again as that of nine pound, if both pieces are so elevated as to range to the farthest distance possible. Another and more important advantage of heavy bullets is, that with the same velocity they break holes in all solid bodies, in a greater proportion than their weight.

weight. Finally, large cannons, by carrying the weight of their bullet in grape or lead-ſhot, may annoy the enemy more effectually than could be done by ten times the number of ſmall pieces. See GUNNERY.

The author here quoted, has propoſed to change the fabric of all the pieces employed in the Britiſh navy, from the twenty four pounders downwards, ſo that they may have the ſame or leſs weight, but a larger bore. He thinks the thirty-two pounders in preſent uſe would be proper models for this purpoſe. Theſe being of fifty-two or fifty-three hundred weight, have ſomewhat leſs than a hundred and two thirds for each pound of bullet. And that this proportion would anſwer in ſmaller pieces, in point of ſtrength, ſeems clear from theſe conſiderations: 1. That the ſtrength of iron or any other metal, is in proportion to its ſubſtance. 2. That the leſſer quantity of powder fired in a ſpace it fills, has proportionably leſs force than a larger quantity; ſo that if two pieces, a large and a ſmall one, be made in the ſame proportion to their reſpective bullets, and fired with a proportionable quantity of powder, the larger piece will be more ſtrained, will heat more, and recoil more than the ſmaller.

On this ſcheme our preſent twenty-four pounders will be eaſed of ſix or eight hundred weight of uſeleſs metal; and ſome pieces of a leſs caliber, as nine and ſix pounders, would be ſometimes eaſed by fourteen hundred: hence much larger guns of the ſame weight might be borne. Thus, inſtead of ſix, nine, twelve, and eighteen pounders, our ſhips might carry twelve, eighteen, and twenty-four pounders: guns would be kept cooler and quieter, and would be of more ſervice, in many reſpects, if their uſual charge of powder were diminiſhed.

GUNELLUS, in ichthyology. See BLENNIUS.

GUNNER, an officer appointed for the ſervice of the cannon; or one ſkilled to fire the guns.

In the tower of London, and other garriſons, as well as in the field, this officer carries a field-ſtaff, and a large powder-horn in a ſtring over his left ſhoulder: he marches by the guns; and when there is any apprehenſion of danger, his field-ſtaff is armed with match: his buſineſs is to lay the gun to paſs, and to help to load and traverſe her.

Maſter-GUNNER, a patent-officer of the ordnance, who is appointed to teach all ſuch as learn the art of gunnery, and to certify to the maſter general the ability of any perſon recommended to be one of the king's gunners. To every ſcholar he adminiſters an oath, not to ſerve, without leave, any other prince or ſtate; or teach any one the art of gunnery, but ſuch as have taken the ſaid oath.

GUNNERY, is the art of charging, directing, and exploding fire-arms, as cannons, mortars, muſkets, *&c.* to the beſt advantage.

To the ART of GUNNERY belongs the knowledge of the force and effects of gun-powder, (ſee GUN POWDER), the dimenſions of cannon, *&c.* and the proportion of the powder and ball they carry, with the method of *managing*, *charging*, *pointing*, *ſpunging*, &c.

A cannon is a military engine, or fire-arm, for throwing iron, lead, or ſtone bullets, by force of gun-powder, to a place exactly oppoſite to the axis of the cylinder whereof it conſiſts.

Cannons are made cylindrical, that the motion of the ball might not be retarded in its paſſage; and that the powder, when on fire, might not ſlip between the ball and the ſurface of the cannon, which would hinder its effect. With regard to the names, dimenſions, weight, *&c.* of cannons, ſee CANNON.

Each ſort of ordnance is more or leſs fortified; which fortification is reckoned by the thickneſs of the metal at the touch-hole, at the trunnions, and at the muzzle, in proportion to the diameter of the bore.

There are three degrees uſed in fortifying each ſort of ordnance, both cannons and culverines: Firſt, ſuch as are ordinarily fortified, which are called legitimate pieces; ſecondly, ſuch whoſe fortifications are leſſened, which are called baſtard pieces; thirdly, double fortified pieces, or extraordinary pieces.

The cannons double fortified have full one diameter of their bore in thickneſs of metal at their touch-hole, and $\frac{11}{16}$ at their trunnions, and $\frac{7}{8}$ at their muzzle. The leſſened cannons have, at their touch-hole, but $\frac{3}{4}$ or $\frac{11}{16}$ of the diameter of their bore in thickneſs of metal, and $\frac{9}{16}$ at their trunnions, and $\frac{5}{16}$ at their muzzle. The ordinary fortified cannons, have $\frac{7}{8}$ at the touch hole, $\frac{5}{8}$ at the trunnions, and $\frac{3}{8}$ at the muzzle. All the double fortified culverines, and all leſſer pieces of that kind, have one diameter and $\frac{1}{8}$ at the touch-hole, $\frac{15}{16}$ at the trunnions, and $\frac{9}{16}$ at the muzzle. And all the ordinary fortified culverines, are fortified every way as the double fortified cannons; and the leſſened culverines, as the ordinary cannons in all points.

With regard to bullets, or balls, wherewith cannons are loaded, they are of various kinds, *viz.* 1. Red-hot bullets, intended to ſet fire to places, where combuſtible matters are found. The bullet is made red-hot, by digging a place in the earth, and lighting in it a great quantity of charcoal, or ſea coal, and placing over it a ſtrong iron grate. When the fire is well lighted, the bullets are placed on the grate, where, in a very ſhort time, they grow red hot; they are taken out with tongs, or iron ladles for the purpoſe, and carried into the piece; having before put ſome clay over the powder the cannon is loaded with, leſt it ſhould be ſet on fire by the red hot bullet: then the piece is fired. Where-ever the bullet paſſes, and meets with combuſtible matters, it ſets them on fire. But when a trench is before the battery of red-hot bullets, hay is rammed over the powder; becauſe, if it was clay, the pieces of it would wound and kill the workmen.

Red-hot bullets are never fired but with eight or four pounders. For if they were of a ſtronger caliber, the bullets could not be ſerved eaſily.

2. Hollow bullets are ſhells made cylindrical, with an aperture and fuſee at one end, which giving fire to the inſide, when in the ground, it burſts, and has the ſame effect with a mine.

3. Chain-bullets confift of two balls joined by a chain, three or four foot a-part.

4. Branch bullets are two balls joined by a bar of iron, five or fix inches a-part.

5. Two-headed bullets, called alfo angels, being two halves of a bullet, joined by a bar or chain: thefe are chiefly ufed at fea, for cutting of cords, cables, fails, *&c.*

As bullets, as well as the pieces of ordnance, are of different caliber, which caliber, in a piece of ordnance, is the diameter of the mouth thereof; and in a bullet, its circumference; there are means found to proportion thefe two calibers to one another, *viz.* with an inftrument called a caliber-rule, wherein a right line is fo divided, as that the firft part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the firft, as the diameters of balls of two, three, four, *&c.* pounds, are to the diameter of one ball of one pound.

The caliber confifts of two thin pieces of brafs, fix inches long, joined by a rivet, fo as to move quite round each other: the head, or one end of the piece, is cut circular, and one half of its circumference divided into every fecond degree. On the other half are divifions from one to ten; each again fubdivided into four: the ufe of which divifions and fubdivifions, is when the diameter of a bullet, *&c.* not exceeding ten inches, is taken, the diameter of the femicircle will, among the divifions, give the length of the diameter, taken between the points of the calibers, in inches and fourth parts.

The degrees on the head ferve to take the quantity of an angle, the method of which is obvious. If the angle be inward, apply the outward edges to the planes that form the angle; the degree cut by the diameter of the femicircle, fhews the quantity of the angle fought. For an outward angle, open the branches till the points be outward, and applying the ftreight edges to the planes that form the angle, the degrees cut by the diameter of the femicircle fhew the angle required; reckoning from 180, towards the right hand.

On one branch of the calibers, on the fame fide, are, firft, fix inches; and each of thefe fubdivided into ten parts. Secondly, a fcale of unequal divifions, beginning at two and ending at ten, each fubdivided into four parts. Thirdly, two other fcales of lines, fhewing, when the diameter of the bore of a piece is taken with the points of the calibers outwards, the name of the piece, whether of the iron or brafs, *i. e.* the weight of the bullet it carries, or that it is fuch or fuch a pounder, from one to forty-two pounds.

On the other branch of the calibers, on the fame fide, is a line of cords to about three inches radius; and a line of lines on both branches, as on the fector; with a table of the names of the feveral pieces of ordnance. On the fame face is a hand graved, and a right line drawn from the finger towards the centre of the rivet, fhewing, by its cutting certain divifions made on the circle, the weight of an iron fhot, when the diameter is taken by the points of the calibers. Laftly, on the circle or head, on the fame fide, are graved feveral geometrical figures, infcribed in each other, with numbers; as a cube, whofe fide is fuppofed one foot; a pyramid on the fame bafe or altitude, and the proportions of their weight, *&c.* a fphere infcribed in a cube; a cylinder, cone, circle, fquare, *&c.*

The outfide of the caliber ferves to take the diameter of the mouth of the piece; and the infide, called the heel, that of the bullet.

There is another method of taking the caliber of the pieces, which is to have a rule very well divided, on which are graved the calibers both of the pieces and bullets. That rule muft be applied on the mouth of the piece, and the caliber is prefently found.

Sometimes, in lieu of bullets, the pieces are charged with cartouches, which are cafes loaded with mufket-balls, nails, chains, and pieces of old iron; fometimes, alfo, with fmall cannon-balls. See Plate XCVIII.

There are cartouches made in form of grapes, which are mufket-balls joined together with pitch, and difpofed on a fmall board, in a pyramidal form round a wooden ftick, which arifes from the middle of the board. (*ibid.*)

The cartouches made of tin are the beft, becaufe they carry further.

There are alfo cartouches made in form of pine apples, whofe figure is pyramidal. Their bafe is equal to the caliber of a bullet, propofed for the piece they are to be fired with; their height is of a caliber and a half; they are dipped in tar, and afterwards rolled on mufket-balls, and when well covered with thofe balls, dipped again in the fame tar, after which they may be ufed, thrufting the biggeft foremoft into the piece. Thefe pine-apples are very good at fea, becaufe, befides that the mufket-balls flying about wound a great number of people, the bullet which is at the bottom of the cartouch does alfo much execution.

There are feveral forts of carriages for ordnance, *viz.* baftard carriages, with low wheels, and high wheels. Sea-carriages, made in imitation of thofe for fhip guns: and carriages for field-pieces, of which there are two kinds.

The carriages muft be proportioned to the pieces mounted on them.—The ordinary proportion is, for the carriage to have $1\frac{1}{2}$ of the length of the gun; the wheels to be half the length of the piece in height; four times the diameter or caliber, gives the depth of the planks the fore end, in the middle $3\frac{1}{2}$.

The piece thus mounted on its carriage, feveral inftruments are employed, fome to prepare the piece to be loaded, fome to load it, others to point it, and others to cleanfe it, *&c.* Thofe inftruments have each their proper name, which are as follows:

The lantern or ladle (*ibid.*) which ferves to carry the powder into the piece, and which confifts of two parts. *viz.* of a wooden box, appropriated to the caliber of the piece for which it is intended, and of a caliber and a half in length with its vent; and of a piece of copper nailed to the box, at the height of a half caliber.

This lantern muft have three calibers and a half in length, and two calibers in breadth, being rounded at the end to load the ordinary pieces.

The rammer, (*ibid.*) which is a round piece of wood, commonly called a box, faftened to a ftick twelve foot long,

long, for the pieces from twelve to thirty three pounders; and ten for the eight and four pounders; which serve to drive home the powder and ball to the breech.

The spunge, (*ibid.*) which is a long staff or rammer, with a piece of sheep or lamb skin wound about its end, to serve for scouring the cannon when discharged, before it be charged with fresh powder; to prevent any spark of fire from remaining in her, which would endanger the life of him who should load her again.

Wad-screw, (*ibid.*) which are two points of iron turned serpent-wise, to extract the wad out of the pieces, when one wants to unload them, or the dirt which had chanced to enter into it.

The botefeux, (*ibid.*) which are sticks two or three feet long, and an inch thick, split at one end, to hold an end of the match twisted round it, to fire the cannon.

The priming iron, (*ibid.*) which is a pointed iron rod, to clear the touch hole of the pieces of powder or dirt; and also to peirce the cartridge, that it may sooner take fire.

The primer, (*ibid.*) which must contain a pound of powder at least, to prime the pieces.

The quoin of mire, which are pieces of wood with a notch on the side to put the fingers on, to draw them back or push them forward, when the gunner points his piece. They are placed on the sole of the carriage.

Leaden plates, which are used to cover the touch-hole, when the piece is charged, lest some dirt should enter it and stop it.

Before you charge the piece, spunge it well, to clean it of all filth and dirt within-side; then the proper weight of gunpowder, which powder drive in and ram down; taking care that the powder be not bruised in ramming, which weakens its effect; run over it a little quantity of paper, hay, or the like; and then throw in the ball.

To point, level, or direct the piece, so as to play against any certain point, is done by the help of a quadrant with a plummet; which quadrant consists of two branches made of brass or wood; one about a foot long, eight lines broad, and one line in thickness; the other four inches long, and the same thickness and breadth as the former. Between these branches is a quadrant, divided into 90 degrees, beginning from the shorter branch, and furnished with thread and plummet.

Place the longest branch of this instrument in the cannon's mouth, and elevate or lower it till the thread cuts the degree necessary to hit the proposed object. Which done, prime the cannon, and then set fire to it.

To point a cannon well, so as to do the execution proposed, we must know the path of a bullet, or the line it describes, from the mouth of the piece to the point where it lodges, which path is commonly called range.

If the piece be laid in a line parallel to the horizon, it is called the right or level range; and if it be mounted to 45 degrees, the ball is said to have the utmost range, and so proportionably; all others between 00 degrees and 45, being called intermediate ranges.

A shot made when the muzzle of a cannon its raised above the horizontal line, and is not designed to shoot directly or point blank, is called random-shot.

The utmost random of any piece is about ten times as far as the bullet will go point blank; and the bullet will go farthest when the piece is mounted to about 45 degrees above the level range.

Mr Norton observes, that

	Paces. *Level.*	Paces. *Utmost Random.*

A 24 pounder may very well fire 90 or 100 shots, every day in summer; at 60 or 75 in winter. In case of necessity, it may fire more And some French officers of artillery assure, that they have caused such a piece to fire every day 150 shots in a siege.

A 16 and a 12 pounder fire a little more, because they are easier served. There have even been some occasions, where 200 shots have been fired from these pieces, in the space of nine hours, and 138 in the space of five.

To range pieces in a battery, take care to reconoitre well the ground where it is to be placed, and the road to convey it, in the night time, the cannon and the munitions.

The pieces must be armed, each with two lanterns, or ladles, a rammer, a spunge, and two priming irons. The battery must also be provided with carriages, and other implements, necessary to remount the pieces which the enemy should chance to dismount.

To serve expeditiously and safely a piece in battery, it is necessary to have to each a sack of leather, large enough to contain about twenty pounds of powder to charge the lanterns or ladles, without carrying them to the magazine; and to avoid thereby making those trains of powder in bringing back the lantern from the magazine, and the accidents which frequently happen thereby.

A battery of 3 pieces must have 30 gabions, because six are employed on each of the two sides or epaulments, which make twelve, and nine for each of the two merlons.

There ought to be two gunners and six soldiers to each piece, and four officers of artillery.

The gunner, posted on the right of the piece, must take care to have always a pouch full of powder, and two priming-irons; his office is to prime the piece, and load

it with powder. That on the left fetches the powder from the little magazine, and fills the lantern or ladle which his comrade holds; after which, he minds that the match be very well lighted, and ready to set fire to the piece at the first command of the officer.

There must be three soldiers on the right, and three on the left of the piece. The two first to take care to ram and spunge the piece, each on his side. The rammer and spunge must be placed on the left, and the lantern or ladle on the right. After having rammed well the wad put over the powder, and that put over the bullet, they then take each a handspike, which they pass between the foremost spokes of the wheel, the ends whereof will pass under the head of the carriage, to make the wheel turn round, leaning on the other end of the handspike, towards the embrasure.

It is the office of the second soldier on the right, to provide wad, and to put it into the piece, as well over the powder as over the bullet; and that of his comrade on the left, to provide 50 bullets, and every time the piece is to be charged, to fetch one of them and put it into the piece, after the powder has been rammed. Then they both take each an handspike, which they pass under the hind part of the wheel, to push it in battery.

The officer of artillery must take care to have the piece diligently served.

In the night he must employ the gunners and soldiers, who shall relieve those who have served 24 hours to repair the embrasures.

If there be no water near the battery, care must be taken to have a cask filled with it, to dip the spunges in it, and cool the pieces, every ten or twelve rounds.

The MORTAR is a short piece of ordnance, thick and wide, proper for throwing bombs, carcasses, shells, stones, *&c.*

There are chiefly two kinds of mortars: the one hung or mounted on a carriage with low wheels, after the manner of guns, called *pendent* or *hanging mortars*; the other fixed on an immoveable base, called *standing mortars*. (*ibid.*)

At the head of the bore, or chase of the mortar, is the chamber for the charge of the powder. This is usually made cylindrical, all but the base which they make hemispherical: though some of the later engineers prefer hemispherical chambers; as the surface of those being less, under equal capacities, make less resistance to the gun-powder.

The thickness of the mortar about the chamber, is to be much greater than about the chase, by reason the gun-powder makes a much greater effort about the chamber than elsewhere. The diameter of the chamber to be much less than that of the bore; by reason bombs, shells, *&c.* are much lighter than the bullets of equal diameters, and consequently less powder suffices.

The first mortar-piece used for throwing stones, weighs commonly 1000 lb. and whose utmost random is 150 fathoms, loaded with two pounds of powder; it has 15 inches of diameter at its mouth, and 2 foot 7 inches in height.

The depth of its bore or chase is 1 foot 7 inches, and the depth of its chamber, without including the entrance where the tampion is placed, 8 inches. The tourillons have 5 inches of diameter,

The chamber must enter an inch into the tourillons; the thickness of the metal about the chamber, 3 inches; the thickness of the belly, 2 inches; and the length of the chase, 1 inch and $\frac{1}{2}$; about each ring, 1 inch and $\frac{3}{4}$.

Mortars, for throwing bombs, are of several kinds.

There are some in the ancient manner, of 6, 7, 8, 9, 10, 11, 12, and 18 inches diameter at their mouth, and which contain in their chambers 3, 4, 5, 6, and 12 pounds of powder.

The chamber where the powder is put is cylindrical, and a little rounded at bottom.

Those of new invention have a concave chamber. And of these there are some which have 12 inches and $\frac{1}{2}$ at the mouth, and contain in their chambers 18 pounds of powder; others 12, and others 8.

The proportions of mortars are as follow: The mortar which throws a bomb of 17 inches 10 lines of diameter, has the bore $27\frac{1}{2}$ inches long, and 18 inches 4 lines of diameter: it has in thickness between the bourelet, and its small reinforced ring, $3\frac{1}{2}$ inches; its small reinforced ring, is $3\frac{1}{4}$ inches thick; its great one, 4 inches; the entrance of its chamber has $5\frac{1}{2}$ inches of diameter; the chamber, in form of a pear, is 13 inches long, and $7\frac{1}{2}$ inches of diameter at its greatest breadth; and also $7\frac{1}{2}$ thick, and contains 12 pounds of powder.

The tourillons of the mortar have 32 inches in length from one end to the other, and 9 of diameter. The mortar has in height 4 foot 4 inches.

The bomb has 17 inches 10 lines of diameter, is 2 inches thick every where, except the bottom, which has 2 inches 10 lines. The aperture of the touch-hole is of 20 lines within and without.

The bomb contains 48 lb. of powder, and weighs 490 lb. and a little more.

The bore of the concave mortar, whose chamber contains 18 pounds of powder, has $12\frac{1}{2}$ inches of diameter, and is $18\frac{1}{2}$ inches long. It has in thickness between the bourelet, and its reinforced ring, $3\frac{1}{2}$ inches; and its reinforced ring is $4\frac{1}{2}$ inches thick. Its chamber has 9 inches 7 lines of diameter at its greatest width: the higher part thereof has 6 inches of diameter, and 4 inches in height; and its lower part $2\frac{3}{4}$ inches. The thickness of the metal round the chamber is of 26 inches 9 lines. The tourillons have, from one end to the other, 8 inches of diameter. The mortar has in height 3 feet 5 inches 4 lines. It throws a bomb of 11 inches 8 lines diameter, which is 1 inch 4 lines thick every where, except at its cullot, which has 1 inch 8 lines. The aperture of its touch hole is 16 lines inside and outside. The bomb contains 15 pounds of powder, and weighs 130 pounds, or thereabout.

The bore or chase of the concave mortar, whose chamber contains 12 pounds of powder, has 12 inches 6 lines of diameter, and 17 inches 6 lines in length. Its thickness between the bourelet and its reinforced ring, is of $2\frac{1}{2}$ inches. Its reinforced ring is 3 inches thick. Its chamber has of diameter, at its greatest width, 9 inches 6 lines. The portion of that chamber a-top has 5 inches 4 lines of diameter, and 2 inches at bottom. The thick-

nefs of the metal round the chamber is 6 inches. The tourillons are, from one end to the other, 30 inches long, and 7 inches of diameter; and the mortar is in all 3 foot 2 inches high.

It throws a bomb 11 inches 8 lines of diameter, which is 1 inch 4 lines thick every where, except at its cullot, which has 1 inch 8 lines.

The aperture of its touch-hole outfide and infide, is 16 lines.

The bomb contains 15 pounds of powder, and weighs 130.

The mortar, which has a concave chamber containing 8 pounds of powder, muft throw a bomb of 11 inches 8 lines. Its diameter is of $12\frac{1}{2}$ inches; its bore 18 inches long; its thicknefs at the chafe $2\frac{1}{4}$ inches; its reinforced ring 6 inches long, and 3 inches thick; its concave chamber 8 inches 8 lines long, and 7 inches in diameter; the thicknefs of the metal round it 5 inches; its tourillons 3 inches long from one end to the other, and 7 inches in diameter. The concave chamber contains 8 pounds of powder, and throws a bomb as above.

The ordinary mortar, which throws a bomb of 11 inches 8 lines, has a bore of 12 inches diameter, and 18 long; its thicknefs at the neck 2 inches; at its reinforced ring $2\frac{1}{2}$ inches; its chamber $9\frac{1}{2}$ inches in length, its diameter of $5\frac{1}{4}$ inches, the thicknefs of the metal round the chamber 7 inches, which chamber contains 6 pounds of powder; the tourillons have in length, from one end to the other, 28 inches, and 8 inches of diameter.

The mortar, which throws a bomb of 8 inches, has the bore 12 inches long, and 8 inches 4 lines in diameter; its thicknefs 1 inch 4 lines at the chafe; its reinforced rings 4 inches 8 lines long, and 1 inch 8 lines thick; its chamber 6 inches long, and 2 inches 8 lines of diameter; its tourillons 18 inches 8 lines in length, and 4 inches 8 lines of diameter. The bomb of 8 inches of diameter is 10 lines thick every where, except at the cullot, which is 13, and its touch-hole 1 inch of diameter infide and outfide. The chamber contains 4 pounds of powder, and the bomb weighs 40 pounds.

The bore of the mortar, which is to throw a bomb of 6 inches, is of $6\frac{1}{4}$ inches of diameter, and 9 inches long; its thicknefs at the chafe 1 inch; its reinforced ring $1\frac{1}{4}$ inch thick, and $3\frac{1}{2}$ inches long; its chamber $4\frac{1}{2}$ inches long, and 2 inches of diameter; the thicknefs of the metal 2 inches, and from the bottom of the chamber to behind the recoil of the mortar 4 inches thick.

Common mortars are very good for the bombardment of a place, when they can be carried near the place; throwing the bomb to 45 degrees of elevation, and to 700 fathoms diftance: the chamber is charged with 5 or 6 pounds of powder, which is the greateft charge, and carries farther: the nearer a place a mortar is mounted, the lefs powder is wanted for its charge. The mortars, with a concave chamber of the fame diameter, *i. e.* of 12 and $12\frac{1}{2}$ inches, pointed at 45 degrees, are proper to bombard places afar off; they carry their bombs from 1200 to 1800 fathoms. Thofe whofe chamber contains 8 pounds of powder, throw the bomb to 1200 fathoms, and weigh 2000 lb. Thofe of 12 pounds of powder will carry their bombs to 1400 fathoms, and weigh 2500 lb. Thofe of 18 pounds of powder will carry to 1800 fathoms, and weigh 5000 lb.

The carriage for a mortar of 12 inches of diameter muft be 6 foot long, the flafks 12 inches long and 10 thick. The trunnions are placed in the middle of the carriage.

The carriage of 18 muft be 4 foot long; and the flafks 11 inches high, and 6 thick.

To mount the mortars of new invention, they ufe carriages of caft iron.

In Germany, to mount mortars from 8 to 9 inches, and carry them into the field, and execute them horizontally as a piece of cannon, they make ufe of a piece of wood 8 feet 2 inches long, with a hole in the middle to lodge the body of the mortar and its trunnions as far as their half diameter, and mounted on two wheels four feet high, to which they join a vantrain proportioned to it, and made like thofe which ferve to the carriages of cannons.

Having mounted the mortar on its carriage, the next thing is to caliber the bomb, by means of a great caliber, the two branches whereof embrace the whole circumference of the bomb: thefe two branches are brought on a rule where the different calibers are marked, among which that of the bomb is found.

A bomb is a hollow iron ball, or fhell, filled with gunpowder, and furnifhed with a vent for a fufee or wooden tube filled with combuftible matter to be thrown out from a mortar. The method of preparing a bomb is as follows: A hollow iron globe is caft pretty thick, having a round aperture by which it may be filled and lighted; and circular anfæ for the commodioufly putting it into the mortar. To prove whether it be ftaunch, after heating it red hot on the coals, it is expofed to the air fo as it may cool gently; for, fince fire dilates iron, if there be any hidden chinks or perforations, they will thus be opened and enlarged, and the rather becaufe of the fpring of the included air continually acting from within. This done, the cavity of the globe is filled with hot water, and the aperture well ftopped, and the outer furface wafhed with cold water and foap; fo that if there be the fmalleft leak, the air, rarified by the heat, will now perfpire and form bubbles on the furface.

If no defect be found in the bomb, its cavity is filled, by means of a funnel, with whole gun-powder; a little fpace or liberty is left, that when a fufee or wooden tube, of the figure of a truncated cone, is driven through the aperture, (with a wooden mallet, not an iron one, for fear of accident), and faftened with a cement made of quick-lime, afhes, brick-duft, and fteel-filings worked together in a glutinous water, or of four parts of pitch, two of colophony, one of turpentine, and one of wax; the powder may not be bruifed. This tube is filled with a combuftible matter, made of two ounces of nitre, one of fulphur, and three of gun-powder-duft well rammed.

This fufee fet on fire, burns flowly till it reaches the gun-powder, which goes off at once, burfting the fhell to pieces with incredible violence. Special care, however, muft be taken, that the fufee be fo proportioned, as that

that the gun-powder do not take fire ere the ſhell arrives at the deſtined place; to prevent which, the fuſee is frequently wound round with a wet clammy thread.

The mortar mounted on its carriage, and the bomb ready, let us place our piece in battery, which battery muſt conſiſt,—1. Of an epaulment to ſhelter the mortars from the fire of the enemy. 2. Of platforms on which the mortars are placed. 3. Of ſmall magazines of powder. 4. Of a boyau which leads to the great magazine. 5. Of ways which lead from the battery to the magazine of bombs. 6. Of a great ditch before the epaulment. 7. Of a berm or retraite.

The platforms for mortars of 12 inches muſt have 9 feet in length, and 6 in breadth.—The lambourds for common mortars muſt be four inches thick; thoſe of a concave chamber of 8 lb. of powder, 5 inches; thoſe of 12 lb. 6 inches; thoſe of 18 lb. 7 inches, or thereabouts. Their length is at diſcretion, provided there be enough to make the platforms 9 feet long.—The fore-part of the platform will be ſituated at two foot diſtance from the epaulment of the battery.—The bombardiers, to ſhelter themſelves in their battery, and not be ſeen from the town beſieged, raiſed an epaulment of 7 foot or more high, which epaulment has no embraſures.

To ſerve expeditiouſly a mortar in battery are required, —five ſtrong handſpikes; a dame or rammer, of the caliber of the conic chamber, to ram the wad and the earth; a wooden knife a foot long, to place the earth round the bomb; an iron ſcraper two foot long, one end whereof muſt be 4 inches broad and roundwiſe, to clean the bore and the chamber of the mortar, and the other end made in form of a ſpoon to clean the little chamber; a kind of brancard to carry the bomb, a ſhovel, and pick-ax.

The officer who is to mind the ſervice of the mortar muſt have a quadrant to give the degrees of elevation.

Five bombardiers, or others, are employed in that ſervice; the firſt muſt take care to fetch the powder to charge the chamber of the mortar, putting his priming-iron in the touch-hole before he charges the chamber; and never going to fetch the powder before he has aſked his officer at what quantity of powder he deſigns to charge, becauſe more or leſs powder is wanted, according to the diſtance where it is fired; the ſame will take care to ram the wad and earth, which another ſoldier ſhall put in the chamber.

That on the right will put again two ſhovels full of earth in the bottom of the bore, which ſhould be likewiſe very well rammed down.

This done, the rammer or dame is returned into its place, againſt the epaulment on the right of the mortar: he takes an handſpike in the ſame place to poſt himſelf behind the carriage of the mortar, in order to help to puſh it into battery: having laid down his handſpike, he takes out his priming-iron, and primes the touch-hole with fine powder.

The ſecond ſoldier on the right and left, will have by that time brought the bomb ready loaded, to be placed in the mortar, which muſt be received in the mortar by the firſt ſoldier, and placed very ſtrait in the bore or chaſe of the mortar.

The firſt, on the right, ſhall furniſh him with earth to put round the bomb, which he muſt take care to ram cloſe with the knife given him by the ſecond on the left.

This done, each ſhall take a handſpike, which the two firſt, on the right and left, ſhall put under the pegs of retreat of the fore part, and the two behind under thoſe of the hind-part; and they together ſhall puſh the mortar in battery.

Afterwards the officer ſhall point or direct the mortar.

During that time the firſt ſoldier ſhall take care to prime the touch hole of the mortar, without ramming the powder; and the laſt on the right, ſhall have the match ready to ſet fire on the fuſee of the bomb on the right, while the firſt ſhall be ready with his on the left, to ſet fire to the touch-hole of the mortar; which he ought not to do till he ſees the fuſee well lighted.

The foremoſt ſoldiers will have their handſpikes ready to raiſe the mortar upright, as ſoon as it has diſcharged; while the hindmoſt on the left ſhall, with the ſcraper, clean the bore and chamber of the mortar.

The magazine of powder for the ſervice of the battery, ſhall be ſituated 15 or 20 paces behind, and covered with boards, and earth over it.—The loaded bombs are on the ſide of the ſaid magazine, at five or ſix paces diſtance.

The officer who commands the ſervice of the mortar, muſt take care to diſcover, as much as poſſible, with the eye, the diſtance of the place where he intends to throw his bomb, giving the mortar the degrees of elevation, according to the judgment he has formed of the diſtance. Having thrown the firſt bomb, he muſt diminiſh or increaſe the degrees of elevation, according to the place upon which it ſhall fall. Several make uſe of tables to diſcover the different diſtances according to the differences of the elevations of the mortar, eſpecially the degrees of the quadrant from 1 to 45.

M. Blondel has wrote a large treatiſe on that ſubject, where he pretends to give a demonſtration to throw bombs with great exactneſs.

They ſay then, (ſays M. Blondel, ſpeaking of bombardiers), that the mortar chaſes more or leſs, according as it is more or leſs charged with powder; and that a mortar, for example, of 12 inches caliber, charged in its chamber with 2 lb. of powder, gives every degree 48 feet difference in the random, and for the greateſt extent under the elevation of 45 degrees, 2160 feet.

The ſame mortar will give every degree 50 foot difference, if it be charged with $2\frac{1}{2}$ of the ſame goodneſs, and 2700 foot for the greateſt random.

Laſtly, it will give 72 foot difference every degree, if the charge be of 3 lb. of the ſame powder; and at the elevation of 45 degrees, which, they ſay, is the greateſt random, it will throw the bomb at the diſtance of 3240 feet.

On this foundation they have made the following tables.

TABLES.

TABLES *for* Mortars *of* 12 *inches of* Caliber.

Firſt Table at *two pounds* of *powder.*

Degrees	*Randoms*	*Degrees*	*Randoms*

38	3116	44	3608
39	3198	45	3690
40	3280		

Granadoes are charged like the bombs, and are very much like them, except that they have no *anſæ*.

A granado is a hollow ball, or ſhell of iron, braſs, or even glaſs, or potters earth, filled with gun powder, and fitted with a fuſee to give it fire. (*ibid.*)

Of theſe there are two kinds; the one large for ditches, or foſſees, called ſometimes bombs, whoſe caliber is the ſame with that of the bullets of 33 lb. and which weigh 16 lb. of 24, and which weigh 12 lb. of 16, which weigh 8 lb.

Theſe granadoes are rolled from the ramparts, or other works, into the ditch, or on a breach, and do much execution.

The other are hand-granadoes, of the bigneſs or caliber of a bullet of 4 lb. and weigh only 2 lb. containing 4 or 5 ounces of powder, or thereabout.

Theſe ſerve to throw with the hand into the trenches, or retrenchments, in the middle of a troop or company, and they infallibly lame or kill.

Care is taken, as much as poſſible, that they be well emptied, ſhaved, and of brittle iron. Their aperture or orifice muſt have ſix lines, or thereabout.

Small lanterns or ladles of copper, and ſmall rammers, are uſed to charge the granadoes.

As to the proportions of granadoes, thoſe of the caliber of

of a bullet of 33, have 6 inches of diameter, and ſomething more; they are 8 lines thick, and weigh 16 lb.

Thoſe of the caliber of 24 have 5 inches 5 lines diameter, are 6 lines thick, and weigh 12 lb.

Thoſe of the caliber of 16 have 4 inches 9 lines of diameter, are 5 lines thick, and weigh 8 lb.

Thoſe which weigh 6 lb. have 3 inches 5 lines diameter, and 5 lines in thickneſs.

Thoſe of 5 lb. weight have 3 inches $2\frac{1}{4}$ lines diameter, and 5 lines in thickneſs.

Thoſe which weigh 3 lb. have 2 inches 8 lines diameter, and are $4\frac{1}{2}$ lines thick.

Thoſe of 2 lb. weight, have 2 inches 4 lines diameter, and 4 lines in thickneſs.

Thoſe of 1 lb. weight have 1 inch 10 lines diameter, and are 3 lines thick.

Thoſe of $\frac{3}{4}$ have 1 inch 8 lines diameter, and are 3 lines thick.

Thoſe of $\frac{1}{2}$ have 1 inch 6 lines diameter, and are 3 lines thick.

Thoſe of a $\frac{1}{4}$ have 1 inch 2 lines diameter, and are $2\frac{1}{2}$ lines thick.

All theſe granadoes muſt be thicker at bottom than any where elſe.

Theſe different ſorts of granadoes have alſo different ſorts of fuſees.

Thoſe of the caliber of	33	24	16	12	8	4
are at the biggeſt end, of	12 *lin.*	11	$10\frac{1}{2}$	10	$9\frac{1}{2}$	$8\frac{1}{2}$
The diameter of the orifices,	4	4	3	3	3	2
The fuſees are in length, in all, of	$5\frac{1}{2}$ *inch.*	5	4	4	$3\frac{1}{2}$	$2\frac{1}{2}$

And as the large granadoes, which are made to throw into the foſſes, or ditches, or with ſmall mortars, they muſt have fuſees of different lengths; theſe are for ſmall mortars; thoſe for ditches muſt be ſhorter.

The Germans cover over the fuſee with paper or parchment, tied with a thread round the fuſee.

In France they uſe a compoſition of black pitch, mixed with a little tallow, with which they rub over the fuſee, when fixed to the granado.

The fuſee muſt burn ſo long, and no longer, as is the time of the motion of the bomb or granado, from the mouth of the mortar, *&c.* to the place where it is to fall, which time is about 27 ſeconds; ſo that the fuſee muſt be contrived, either from the nature of the compoſition, or the length of the pipe which contains it, to burn juſt that time.

At Paris they charge the fuſees for the bombs and granadoes with a compoſition made with powder-duſt and charcoal, very well pounded, and ſifted very fine, putting two ounces of charcoal on each pound of powder, and make ſeveral proofs, to know if the compoſition be not too quick.

There are ſeveral other compoſitions to charge the fuſees for bombs or granadoes.

The firſt is of 4 lb. of powder, 2 lb. of ſaltpetre, and 1 lb. of ſulphur.

The ſecond is of 5 lb. of powder, 2 lb. of ſaltpetre, and 1 pound of ſulphur.

The third, which is the beſt, is of 3 lb. of powder, 2 lb. of ſaltpetre, and 1 lb. of ſulphur.

The fourth is of 3 lb. of powder, 2 lb. of ſaltpetre, and $\frac{1}{2}$ lb. of ſulphur.

The fuſees muſt be charged even, *i. e.* they muſt burn without ſpitting.

The fuſee of the hand-granado, which is of the caliber of 4, muſt be 2 inches 2 lines long, 9 lines of diameter, and 6 lines at the ſmall end: the orifice of the fuſee $2\frac{1}{2}$ lines.

As ſoon as the fuſee is placed to the granado, the head thereof muſt be ſauced in melted pitch, and afterwards dipped in water, which hinders the compoſition from ſpoiling, and the wood from rotting.

The PETARD, *(ibid.)* is the next piece of artillery which deſerves our attention, and is a kind of engine of metal, ſomewhat in ſhape of a high-crowned hat, ſerving to break down gates, barricades, draw-bridges, or the like works; which are intended to be ſurprized. It is very ſhort, narrow at the breach, and wide at the muzzle, made of copper mixed with a little braſs, or of lead with tin.

The petards are not always of the ſame height and bigneſs: they are commonly 10 inches high, 7 inches of diameter a-top, and 10 inches at bottom. They weigh commonly 40, 45, and 50 pounds.

The madrier, on which the petard is placed, and where it is tied with iron circles, is of two feet for its greateſt width, and of 18 inches on the ſides, and no thicker than a common madrier. Under the madrier are two iron bars paſſed croſs-ways, with a hook, which ſerves to fix the petard.

To charge a petard 15 inches high, and 6 or 7 inches of caliber or diameter at the bore, the inſide muſt be firſt very well cleaned and heated, ſo that the hand may bear the heat; then take the beſt powder that may be found, throw over it ſome ſpirit of wine, and expoſe it to the ſun, or put it in a frying-pan; and when it is well dried, 5 or 6 lb. of this powder is put into the petard, which reaches within three fingers of the mouth: the vacancies are filled with tow, and ſtopped with a wooden tampion; the mouth being ſtrongly bound up with cloth tied very tight with ropes; then it is fixed on the madrier, that has a cavity cut in it to receive the mouth of the petard, and faſtened down with ropes.

Some, inſtead of gun powder for the charge, uſe one of the following compoſitions, *viz.* gun-powder ſeven pounds, mercury ſublimate one ounce, camphor eight ounces; or gun-powder ſix pounds, mercury ſublimate three ounces, and ſulphur three; or gun-powder ſix, beaten glaſs $\frac{1}{2}$ an ounce, and camphor $\frac{3}{4}$.

Before any of theſe pieces are appropriated for ſervice, it is neceſſary to have each undergo a particular trial of its ſoundneſs, which is called a proof, to be made by or before one authoriſed for the purpoſe, called the *proof-maſter*.

To make a proof of the piece, a proper place is choſen, which is to be terminated by a mount of earth very thick to receive the bullets fired againſt it, that none of them may run through it. The piece is laid on the ground,

ſupported only in the middle by a block of wood. It is fired three times: the firſt with powder of the weight of the bullet, and the two others with $\frac{1}{4}$ of the weight; after which a little more powder is put in to ſinge the piece; and after this water, which is impreſſed with a ſpunge, putting the finger on the touch-hole, to diſcover if there be any cracks; which done, they are examined with the cat, which is a piece of iron with three graſps, diſpoſed in the form of a triangle, and of the caliber of the piece; then it is viſited with a wax candle, but it is of very little ſervice in the ſmall pieces, becauſe if they be a little long, the ſmoke extinguiſhes it immediately.

The proof of mortars is made in this manner: Where there are carriages of caſt iron, the mortar is placed on one of thoſe carriages. Under that carriage is made a platform of madriers 5 or 6 inches thick; the mortar is charged with the beſt powder, and with as much of it as its chamber can contain, obſerving to leave no vacuity at the neck of the mortar, but what is neceſſary to put a little wad over the powder, and which is rammed with the end of an handſpike, to keep the powder together as much as poſſible. A large green turf, with earth two fingers deep, is put over the wad, which muſt have width enough to fill up the bottom of the mortar. This turf and earth are very well rammed down, then the bomb is placed over it as upright as poſſible, leaving a ſmall place round it, which is to be filled with clay as tight as poſſible, preſſing it between the mortar and the bomb with a pointed ſtick; and as it is not neceſſary to ſpend much powder in theſe ſort of proofs, the bomb muſt be filled with as much earth as it would contain powder.

For want of carriages of caſt iron, holes are dug in the earth where the mortars are buried as far as the touch-hole; and in order that the mortars thus buried may find more reſiſtance, and make a greater effort, large pieces of wood in form of joiſts are put under the mortar, chuſing always the hardeſt ground, to reſiſt better the recoil of the mortar.

A fuſee for granadoes is put on the touch-hole of each mortar, that the gunner may have time to retire, in caſe the mortar was to burſt in the proof; which is alſo practiſed in the proof of the pieces.

This proof is made three times, without increaſing or diminiſhing any thing.

Beſides the large pieces mentioned throughout this treatiſe, invented for the deſtruction of mankind, there are others called ſmall guns, *viz.* muſkets of ramparts, common muſkets, fuſils, carabines, muſketoons, and piſtols.

A muſket, or muſquet, is a fire-arm borne on the ſhoulder, and uſed in war, formerly fired by the application of a lighted match, but at preſent with a flint and lock.

The common muſkets are of the caliber of 20 leaden balls to the pound, and receive balls from 22 to 24: its length is fixed to 3 feet 8 inches from the muzzle to the touch-pan.

A fuſil, or fire-lock, has the ſame length and caliber; and ſerves at preſent inſtead of a muſket.

A carabine is a ſmall ſort of fire-arm, ſhorter than a fuſil, and carrying a ball of 24 in the pound, borne by the light-horſe, hanging at a belt over the left ſhoulder.

The carabine is a kind of medium between the piſtol and the muſket; and bears a near affinity to the arquebuſs, only that its bore is ſmaller. It was formerly made with a match-lock, but of late only with a flint-lock.

The muſquetoon is of the ſame length of the carabine, the barrel poliſhed, and clean within.

The muſquetoon carries five ounces of iron, or ſeven and a half of lead, with an equal quantity of powder.

The barrel of a piſtol is generally 14 inches long.

As to the invention of cannon and gun powder, we are certain that they are diſcoveries of a modern date: but there is no depending upon the various accounts given of them by authors. All that can be ſaid with certainty is, that there is mention made of gun-powder in the regiſter of the chamber of accounts in France, in the year of Chriſt 1338; that Alphonſus XI. king of Caſtile, beſieged the Moors with iron mortars, in the year of Chriſt 1343; and that our King Edward, in 1346, firſt carried thoſe thundering machines of war and death into France, where he availed himſelf of five or ſix pieces of cannon at the battle of Creſſy.

Before the invention of theſe inſtruments of war, the ancients made uſe of the aries, or battering-ram, the catapultæ, the balliſta, ſcorpion, and teſtudo. See Ram, *&c.*

For the mathematical principles of Gunnery, ſee Projectiles.

GUN-POWDER, a compoſition of ſaltpetre, ſulphur, and charcoal, mixed together, and uſually granulated; which eaſily takes fire, and, when fired, rarifies, or expands, with great vehemence, by means of its elaſtic force.

It is to this powder we owe all the action and effect of guns, ordnance, *&c.* ſo that the modern military art, fortification, *&c.* in a great meaſure depend thereon.

Method of making Gun powder. Dr Shaw's recipe for this purpoſe is as follows. Take four ounces of refined ſaltpetre, an ounce of brimſtone, and ſix drams of ſmall coal: reduce theſe to a fine powder, and continue beating them for ſome time in a ſtone mortar, with a wooden peſtle, wetting the mixture between whiles with water, ſo as to form the whole into an uniform paſte, which is reduced to grains, by paſſing it through a wire ſieve fit for the purpoſe; and in this form being carefully dried, it becomes the common gun-powder.

For greater quantities, mills are uſually provided, by means of which more work may be performed in one day, than a man can do in a hundred.

The nitre or ſaltpetre is refined thus: diſſolve four pounds of rough nitre as it comes to us from the Indies, by boiling it in as much water as will commodiouſly ſuffice for that purpoſe: then let it ſhoot for two or three days in a covered veſſel of earth, with ſticks laid acroſs for the cryſtals to adhere to. Theſe cryſtals being taken out, are drained and dried in the open air.

In order to reduce this ſalt to powder, they diſſolve

a

a large quantity of it in as ſmall a proportion of water as poſſible; then keep it conſtantly ſtirring over the fire, till the water exhales, and a white dry powder is left behind.

In order to purify the brimſtone employed, they diſſolve it with a very gentle heat; then ſcum and paſs it through a double ſtrainer. If the brimſtone ſhould happen to take fire in the melting, they have an iron cover that fits on cloſe to the melting veſſel, and damps the flame. The brimſtone is judged to be ſufficiently refined if it melts, without yielding any fetid odour, between two hot iron plates, into a kind of red ſubſtance.

The coal for the making of gun-powder is either that of willow, or hazel, well charred in the uſual manner, and reduced to powder. And thus the ingredients are prepared for making this commodity: but as theſe ingredients require to be intimately mixed, and as there would be danger of their firing if beat in a dry form, the method is to keep them continually moiſt, either with water, urine, or a ſolution of ſal ammoniac: they continue thus ſtamping them together for twenty-four hours, after which the maſs is fit for corning and drying in the ſun, or otherwiſe, ſo as ſeduloully to prevent its firing.

Rationale of GUN-POWDER. The exploſive force of gun-powder is now a thing commonly known, but the phyſical reaſon thereof may not perhaps be hitherto ſufficiently underſtood. In order to explain it, Dr Shaw propoſes the following obſervations: 1. That ſaltpetre of itſelf is not inflammable; and though it melts in the fire, and grows red hot, yet does not explode, unleſs it comes in contact with the coals. 2. That brimſtone eaſily melts at the fire, and eaſily catches flame. 3. That powdered charcoal readily takes fire, even from the ſparks yielded by a flint and ſteel. 4. That if nitre be mixed with powdered charcoal, and brought in contact with the fire, it burns and flames. 5. That if ſulphur be mixed with powdered charcoal, and applied to the fire, part of the ſulphur burns ſlowly away, but not much of the charcoal; and, 6. That if a lighted coal be applied to a mixture of nitre and ſulphur, the ſulphur preſently takes fire with ſome degree of exploſion; leaving part of the nitre behind, as we ſee in making the ſal prunellæ, and ſal polychreſtum.

Theſe experiments duly conſidered, adds the doctor, may give us the chemical cauſe of the ſtrange exploſive force of gun-powder. For each grain of this powder conſiſting of a certain proportion of ſulphur, nitre, and coal, the coal preſently takes fire, upon contact of the ſmalleſt ſpark: at which time both the ſulphur and the nitre immediately melt, and by means of the coal interpoſed between them, burſt into flame; which, ſpreading from grain to grain, propagates the ſame effect almoſt inſtantaneouſly: whence the whole maſs of powder comes to be fired: and as nitre contains both a large proportion of air and water, which are now violently rarified by the heat, a kind of fiery exploſive blaſt is thus produced, wherein the nitre ſeems, by its aqueous and aerial parts, to act as bellows to the other inflammable bodies, ſulphur and coal, to blow them into a flame, and carry off their whole ſubſtance in ſmoke and vapour.

Different kinds of GUN-POWDER. The three ingredients of gun-powder are mixed in various proportions according as the powder is intended for muſkets, great guns, or mortars; though theſe proportions ſeem not to be perfectly adjuſted or ſettled by competent experience.

Semienowitz, for mortars, directs an hundred pounds of ſaltpetre, twenty-five of ſulphur, and as many of charcoal; for great guns, an hundred pounds of ſaltpetre, fifteen pound of ſulphur, and eighteen pound of charcoal; for muſkets and piſtols, an hundred pound of ſaltpetre, eight pound of ſulphur, and ten pound of charcoal. Miethius extols the proportion of one pound of ſaltpetre to three ounces of charcoal, and two, or two and a quarter of ſulphur; than which, he affirms, no gun-powder can poſſibly be ſtronger. He adds, that the uſual practice of making the gun-powder weaker for mortars than guns, is without any foundation, and renders the expence needleſly much greater: for whereas to load a large mortar, twenty-four pound of common powder is required, and conſequently, to load it ten times, two hundred and forty pound, he ſhews, by calculation, that the ſame effect would be had by one hundred and fifty pound of the ſtrong powder.

To increaſe the ſtrength of powder, Dr Shaw thinks it proper to make the grains conſiderably large, and to have it well ſifted from the ſmall duſt. We ſee that gun-powder, reduced to duſt, has little exploſive force; but when the grains are large, the flame of one grain has a ready paſſage to another, ſo that the whole parcel may thus take fire nearly at the ſame time, otherwiſe much force may be loſt, or many of the grains go away as ſhot unfired.

It ſhould alſo ſeem that there are other ways of increaſing the ſtrength of powder, particularly by the mixture of ſalt of tartar; but perhaps, adds the laſt-mentioned author, it were improper to divulge any thing of this kind, as gun-powder ſeems already ſufficiently deſtructive.

Method of trying and examining GUN POWDER. There are two general methods of examining gun-powder; one with regard to its purity, the other with regard to its ſtrength. Its purity is known by laying two or three little heaps near each other upon white paper, and firing one of them: for if this takes fire readily, and the ſmoke riſes upright, without leaving any droſs or feculent matter behind, and without burning the paper, or firing the other heaps, it is eſteemed a ſign that the ſulphur and nitre were well purified, that the coal was good, and that the three ingredients were thoroughly incorporated together: but if the other heaps alſo take fire at the ſame time, it is preſumed, that either common ſalt was mixed with the nitre, or that the coal was not well ground, or the whole maſs not well beat, and mixed together; and if either the nitre or ſulphur be not well purified, the paper will be black or ſpotted.

In order to try the ſtrength of gun-powder, there are two kinds of inſtruments in uſe; but neither of them

them appear more exact than the common method of trying to what distance a certain weight of powder will throw a ball from a musket.

There has been much talk of a white powder, which, if it answered the character given it, might be a dangerous composition; for they pretend that this white powder will throw a ball as far as the black, yet without making a report; but none of the white powder we have seen, says Dr Shaw, answers to this character; being, as we apprehend, commonly made either with touchwood or camphor, instead of coal.

Observations on the force of GUN-POWDER. Gun-powder, fired either in vacuum, or in air, produces, by its explosion, a permanent elastic fluid. For if a red-hot iron be included in a receiver, after being exhausted, and gun powder be let fall on the iron, the powder will take fire, and the mercurial gage will suddenly descend upon the explosion; and though it immediately ascends again, yet it will never rise to the height it first stood at, but will continue depressed by a space proportioned to the quantity of gun powder which was let fall on the iron.

The same production likewise takes place, when gun powder is fired in the air: for if a small quantity of powder be placed in the upper part of a glass tube, and the lower part of the tube be immerged in water, and the water be made to rise so near the top, that only a small portion of air is left in that part where the gun-powder is placed; if in this situation the communication of the upper part of the tube with the external air be closed, and the powder be fired, which will easily be done by a burning-glass, the water will in this experiment descend upon the explosion as the quicksilver did in the last; and will always continue depressed below the place at which it stood before the explosion; and the quantity of this depression will be greater, if the quantity of powder be increased, or the diameter of the tube be diminished. From whence it is proved, that as well in air as in a vacuum, the explosion of fired powder produces a permanent elastic fluid. It also appears from experiment, that the elasticity or pressure of the fluid produced by the firing of gun powder, is *cæteris paribus*, directly as its density. This follows from hence, that if in the same receiver a double quantity of powder be let fall, the mercury will subside twice as much as in the firing of a single quantity.

To determine the elasticity and quantity of this elastic fluid, produced from the explosion of a given quantity of gun-powder, Mr Robins premises, that the elasticity of this fluid increases by heat, and diminishes by cold, in the same manner as that of the air; and that the density of this fluid, and consequently its weight, is the same with the weight of an equal bulk of air having the same elasticity, and the same temperature.

From these principles, and from his experiments, (for a detail of which we must refer the reader to his New Principles of Gunnery, in Scholium to prop. II.) he concludes, that the fluid produced by the firing of gun-powder will be $\frac{3}{10}$ of the weight of the gun-powder, and the ratio of the respective bulks of the powder, and the fluid produced from it, will be in round numbers 1 to 244.

Hence we are certain that any quantity of powder fired in any confined space, which it adequately fills, exerts, at the instant of its explosion, against the sides of the vessels containing it, and the bodies it impels before it, a force at least 244 times greater than the elasticity of common air; or, which is the same thing, than the pressure of the atmosphere; and this without considering the great addition which this force will receive from the violent degree of heat with which it is endued at that time, the quantity of which augmentation is the next head of Mr Robin's enquiry. He determines that the elasticity of the air is augmented when heated to the extremest heat of red hot iron, in the proportion of 796 to $194\frac{1}{3}$; and supposing that the flame of fired gun-powder is not less hot than red hot iron, and the elasticity of the air, and consequently of the fluid, generated by the explosion, being augmented by the extremity of this heat in the ratio of 796 to $194\frac{1}{3}$, it follows, that if 244 be augmented in this ratio, the resulting number, which is $999\frac{1}{3}$, will determine how many times the elasticity of the flame of fired powder exceeds the elasticity of common air, supposing it to be confined in the same space which the powder filled before it was fired.

Hence then, the absolute quantity of the pressure exerted by gun-powder at the moment of its explosion may be assigned: for since the fluid then generated has an elasticity of $999\frac{1}{3}$, or, in round numbers, 1000 times greater than common air; and since common air, by its elasticity, exerts a pressure on any given surface equal to the weight of the incumbent atmosphere with which it is in *equilibrio*, the pressure exerted by fired powder, before it has dilated itself, is 1000 times greater than the pressure of the atmosphere; and consequently the quantity of this force on a surface of an inch square amounts to above six tun weight, which force however diminishes as the fluid dilates itself. The variations of the density of the atmosphere does not any way alter the action of powder by any experiment that can be made. But the moisture of the air has a very great influence on the force of it: for that quantity which in a dry season would communicate to a bullet a velocity of 1700 feet in one second, will not in damp weather communicate a velocity of more than 12 or 1300 feet in a second, or even less, if the powder be bad and negligently kept.

The velocity of expansion of the flame of gunpowder, when fired in a piece of artillery, without either bullet, or any other body before it, is prodigious. By the experiments of Mr Robins, it seems this velocity cannot be much less than 7000 feet in a second. This, however, must be understood of the most active part of the flame. For, as was observed before, the elastic fluid, in which the activity of gunpowder consists, is only $\frac{3}{10}$ of the substance of the powder, the remaining $\frac{7}{10}$ will in the explosion be mixed with the elastic part, and will by its weight retard

tard the activity of the explosion; and yet they will be so completely united, as to move with uncommon motion; but the unelastic part will be less accelerated than the rest, and some of it will not even be carried out of the barrel, as appears by the considerable quantity of unctuous matter, which adheres to the inside of all fire-arms, after they have been used. These inequalities in the expansive motion of the flame render it impracticable to determine its velocity, otherwise than from experiments.

To recover damaged GUN POWDER. The method of the powder-merchants is, to put part of the powder on a sail-cloth, to which they add an equal weight of what is really good; and with a shovel mingle it well together, dry it in the sun, and barrel it up, keeping it in a dry and proper place. Others again, if it be very bad, restore it by moistening it with vinegar, water, urine, or brandy: then they beat it fine, searce it, and to every pound of powder add an ounce, an ounce and a half, or two ounces, according as it is decayed, of melted salt petre. Afterwards, these ingredients are to be moistened and mixed well, so that nothing can be discerned in the composition, which may be known by cutting the mass; and then they granulate it as aforesaid. In case the powder be in a manner quite spoiled, the only way is to extract the salt-petre with water, according to the usual manner, by boiling, filtrating, evaporating, and crystallizing; and then with fresh sulphur and charcoal to make it up a-new again. In regard to the medical virtues of gun-powder, Boerhaave informs us, that the flame of it affords a very healthy fume in the height of the plague: because the explosive acid vapour of nitre and sulphur corrects the air; and that the same vapour, if received in a small close pent up place, kills insects.

It is enacted by 5 and 11 of Geo I. and 5 Geo. II. *c.* 20. that gun-powder be carried to any place in a covered carriage; the barrels being close jointed; or in cases and bags of leather, *&c.* And persons keeping more than 200 pounds weight of gun-powder at one time, within the cities of London and Westminster, or the suburbs, *&c.* are liable to forfeitures if it be not removed; and justices of peace may issue warrants to search for, seize, and remove the same.

The invention of gun-powder is ascribed by Polydore Virgil to a chemist, who having accidentally put some of the ingredients in this composition in a mortar, and covered it over with a stone, it happened to take fire, and blew up the stone. Thevet says, the person here spoken of was a monk of Friburg, named Constantine Anelzen; but Belleforet and others hold it to be Bartholdus Schwartz, or the black; at least it is affirmed, that he first taught the use of it to the Venetians, in the year 1380, during the war with the Genoese. But what contradicts this account, and shews gun-powder to be of an older date, is, that Peter Mexia, in his Variæ Lectiones, relates, that Alphonsus XI. king of Castile, used mortars against the Moors in a siege in 1343. Ducange adds, that there is mention made of this powder in the registers of the chambers of accounts in France, as early as the year 1338; and frier Bacon, our countryman, mentions the composition in express terms, in his treatise De nullitate magiæ, published at Oxford, in the year 1216.

GUN-SHOT-WOUNDS. See SURGERY.

GUNTSBERG, a town of Germany in the circle of Swabia, situated on the east side of the Danube: E. long. 10° 15′, N. lat. 48° 35′.

GUNTER's LINE, a logarithmic line, usually graduated upon scales, sectors, *&c.*

It is also called the line of lines, and line of numbers; being only the logarithms graduated upon a ruler, which therefore serves to solve problems instrumentally in the same manner as logarithms do arithmetically. It is usually divided into an hundred parts, every tenth whereof is numbered, beginning with 1, and ending with 10; so that, if the first great division, marked 1, stand for one tenth of any integer, the next division, marked 2, will stand for two tenths; 3, three tenths, and so on; and the intermediate divisions will, in like manner, represent 100dth parts of the same integer. If each of the great divisions represent 10 integers, then will the lesser divisions stand for integers; and if the greater divisions be supposed each 100, the subdivisions will be each 10.

Use of GUNTER's LINE. 1. *To find the product of two numbers.* From 1 extend the compasses to the multiplier; and the same extent, applied the same way from the multiplicand, will reach to the product. Thus if the product of 4 and 8 be required, extend the compasses from 1 to 4, and that extent laid from 8 the same way, will reach to 32, their product. 2. *To divide one number by another.* The extent from the divisor to unity, will reach from the dividend to the quotient: thus, to divide 36 by 4, extend the compasses from 4 to 1, and the same extent will reach from 36 to 9, the quotient sought. 3. *To three given numbers, to find a fourth proportional.* Suppose the numbers 6, 8, 9; extend the compasses from 6 to 8, and this extent, laid from 9 the same way, will reach to 12, the fourth proportional required. 4. *To find a mean proportional between any two given numbers.* Suppose 8 and 32; extend the compasses from 8, in the left hand part of the line, to 32 in the right; then bissecting this distance, its half will reach from 8 forward, or from 32 backward, to 16, the mean proportional sought. 5. *To extract the square root of any number.* Suppose 25; bissect the distance between 1 on the scale and the point representing 25; then the half of this distance, set off from 1, will give the point representing the root 5. In the same manner, the cube root, or that of any higher power, may be found by dividing the distance on the line, between 1 and the given number, into as many equal parts as the index of the power expresses; then one of those parts, set from 1, will find the point representing the root required.

GUNTER's QUADRANT, one made of wood, brass, *&c.* containing a kind of stereographic projection of the sphere, on the plane of the equinoctial; the eye being supposed placed in one of the poles.

GUNTER'S SCALE, called by navigators fimply the gunter, is a large plain fcale, generally two foot long, and about an inch and a half broad, with artificial lines delineated on it, of great ufe in folving queftions in trigonometry, navigation, *&c.*

GUN-WALE, or GUNNEL, is the uppermoft wale of a fhip, or that piece of timber which reaches on either fide from the quarter-deck to the forecaftle, being the uppermoft bend which finifhes the upper works of the hull, in that part in which are put the ftanchions which fupport the wafte-trees.

GURIEL, a fubdivifion of Georgia in Afia, fituated on the eaftern coaft of the Euxine fea.

GURK, a city of Carinthia, in Germany: E. long. 14°, N. lat. 47° 20′.

GURNARD, in ichthyology. See TRIGLA.

GUSSET, in heraldry, is formed by a line drawn from the dexter or finifter chief points, and falling down perpendicularly to the extreme bafe. See Plate XCVII. fig. 8.

The guffet is an abatement of honour, denoting an effeminate perfon.

GUSTROW, a town of Germany, in the dutchy of Mecklenburg: E. long. 12° 15′, N. lat. 54°.

GUTS. See ANATOMY, p. 257.

GUTSKROW, a city of Germany in the circle of Upper Saxony, and province of Swedifh Pomerania: E. long. 13° 40′, N. lat. 54°.

GUTTÆ, in architecture, are ornaments in the form of little cones, ufed in the plafond of the Doric corniche, or on the architrave underneath the triglyphs, reprefenting a fort of drops or bells. See ARCHITECTURE.

GUTTA SERENA, a difeafe in which the patient, without any apparent fault in the eye, is entirely deprived of fight. See MEDICINE.

GUTTERS, in architecture, a kind of canals in the roofs of houfes, ferving to receive and carry off the rain.

GUTTURAL, a term applied to letters or founds pronounced or formed as it were in the throat.

GUTTY, in heraldry, a term ufed when any thing is charged or fprinkled with drops. In blazoning, the colour of the drops is to be named; as, gutty of fable, of gules, *&c.*

GUY, in a fhip, is any rope ufed for keeping off things from bearing or falling againft the fhip's fide when they are hoifting in.

That rope which at one end is made faft to the foremaft, and feized to a fingle block at the pendant of the garnet, is called the guy of the garnet.

GUZES, in heraldry, roundles of a fanguine or murry colour. Thefe, from their bloody hue, are by fome fuppofed to reprefent wounds.

GYMNASIARCH, in antiquity, the director of the gymnafium. He had two deputies under him; the one called xyftarch, who prefided over the athletæ, and had the overfight of the wreftling; the other gymnaftes, who had the direction of all the other exercifes.

GYMNASIUM, in Grecian antiquity, a place fitted for performing exercifes.

Gymnafia, according to Potter, were firft ufed at Lacedæmon, but were afterwards very common in all the parts of Greece, and imitated, very much augmented, and improved at Rome. They were not fingle edifices, but a knot of buildings united, being fo capacious as to hold many thoufands of people at once; and having room enough for philofophers, rhetoricians, and the profeffors of all other fciences, to read their lectures; and wreftlers, dancers, and all others who would, to exercife at the fame time without the leaft difturbance or interruption. They confifted of a great many parts, the chief of which were, the porticos, elæothefium, palæftra, conifterium, *&c.*

Athens had feveral gymnafia, of which the lyceum, academia, and cynofurges, were thofe of moft note.

The lyceum was fituated on the banks of the river Iliffus, and received its name from Apollo, to whom it was dedicated.

The lyceum was the place where Ariftotle taught philofophy, walking there every day till the hour of anointing; whence he and his followers got the name of peripatetics.

The academy was part of the ceramicus without the city, where Plato lectured. See ACADEMY.

GYMNASTICS, the art of performing the feveral bodily exercifes, as wreftling, running, fencing, dancing, *&c.*

GYMNOPYRUS, in natural hiftory, a name given by Dr Hill to the pyritæ of a fimple internal ftructure, and not covered with a cruft.

Of thefe there are only two fpecies: 1. A green varioufly fhaped kind. 2. A botryoide kind.

The firft fpecies is the moft common of all the pyritæ, and appears under a great diverfity of fhapes. It is very hard and heavy, very readily gives fire with fteel, but will not at all ferment with aquafortis. The fecond fpecies is very elegant and beautiful, and its ufual colour is a very agreeable pale green; but what moft diftinguifhes it from all other pyritæ is, that its furface is always beatifully elevated into tubercles of various fizes, refembling a clufter of grapes.

GYMNOSOPHISTS, a fect of philofophers who clothed themfelves no farther than modefty required. There was fome of thefe fages in Africa; but the moft celebrated clan of them was in India. The African gymnofophifts dwelt upon a mountain in Ethiopia, near the Nile, without the accommodation either of houfe or cell. They did not form themfelves into focieties like thofe of India, but each had his private retirement, where he ftudied and performed his devotions by himfelf. If any perfon had killed another by chance, he applied to thefe fages for abfolution, and fubmitted to whatever penances they enjoined. They obferved an extraordinary frugality, and lived only upon the fruits of the earth. Lucan afcribes to thefe gymnofophifts feveral new difcoveries in aftronomy.

As to the Indian gymnofophifts, they dwelt in the woods, where they lived upon the wild products of the earth, and never drank wine, nor married. Some of them practifed phyfic, and travelled from one place to another: thefe were particularly famous for their remedies

remedies againſt barrenneſs. Some of them, likewiſe, pretended to practiſe magic, and to foretell future events.

In general, the gymnoſophiſts were wiſe and learned men: their maxims and diſcourſes, recorded by hiſtorians, do not in the leaſt ſavour of a barbarous education, but are plainly the reſult of great ſenſe and deep thought. They keep up the dignity of their character to ſo high a degree, that it was never their cuſtom to wait upon any body, not even upon princes themſelves; for which reaſon Alexander, who would not condeſcend to viſit them in perſon, ſent ſome of his courtiers to them in order to ſatisfy his curioſity. Their way of educating their diſciples is very remarkable: every day, at dinner, they examined them how they had ſpent the morning; and every one was obliged to ſhew, that he had diſcharged ſome good office, practiſed ſome virtue, or improved in ſome part of learning: if nothing of this appeared, he was ſent back without his dinner. They held a tranſmigration of ſouls; and it is probable that Pythagoras borrowed his doctrine from them.

GYMNOSPERMIA, in botany. See Botany, p. 636.

GYMNOTUS, in ichthyology, a genus of fiſhes belonging to the order of apodes. They have two tentacula at the upper lip; the eyes are covered with the common ſkin; there are five rays in the membrane of the gills; the body is compreſſed, and carinated on the belly with a fin. There are five ſpecies.

GYNÆCEUM, among the ancients, the apartment of the women, a ſeparate room in the inner part of the houſe, where they employed themſelves in ſpinning, weaving, and needle-work.

GYNÆCOCRACY, denotes the government of women, or a ſtate where women are capable of the ſupreme command. Such are Britain and Spain.

GYNANDRIA, in botany. See Botany, p. 635.

GYPSIES. See Egyptians.

GYPSUM, or Plaster-stone, in natural hiſtory, a genus of foſſils, naturally and eſſentially ſimple, not inflammable nor ſoluble in water, and compoſed of flat ſmall particles, which form bright, gloſſy, and in ſome degree tranſparent maſſes, not flexible or elaſtic, not giving fire with ſteel, nor fermenting with, or being ſoluble in, acid menſtrua, and very eaſily calcined in the fire.

Of theſe gypſums, ſome are harder, others ſofter, and are of ſeveral colours; as, white, grey, red, green, *&c.* ſometimes diſtinct, and ſometimes variouſly blended together.

The texture of all the gypſums being ultimately the ſame, it may be ſufficient to obſerve, that their origin is plainly from particles of a determinate nature and ſubſtance, and of a certain and invariable figure, an oblong, flat, and irregularly angular one. Theſe we ſometimes ſee, as indeed is moſt natural to them, diſpoſed without order or regularity, into looſe, complex, friable maſſes; at others, they are getting out of their native order, and emulating the ſtructure of other claſſes of bodies, of which they are indeed properly the baſis, and appearing ſomewhat in the figure of the fibrariæ; and at other times, of the foliaceous compoſite flakes of the ſelenitæ: the ſpecies which have theſe ſtructures, are truly varying from the gypſums into thoſe bodies they emulate; for the fibrariæ are only a peculiar arrangement of theſe very particles, and the ſelenitæ only more broad flakes of the ſame, like thoſe of the foliaceous talcs.

The gypſums are much uſed in plaſter, for ſtuccoing rooms, and caſting buſts and ſtatues.

GYRFALCON. See Falco.

GYSHORN, a town of germany, in the dutchy of Lunenburg, ſituated on the river Aller, forty-five miles north-eaſt of Hanover: E. long. 10° 45′, and N. lat. 52° 50′.

H

HABAT, the north-weſt province of the empire of Morocco, ſituated on the ſtreights of Gibraltar.

HABAKKUK, or the prophecy of Habakkuk, a canonical book of the Old Teſtament.

There is no mention made in ſcripture, either of the time when this prophet lived, or of the parents from whom he was deſcended; but according to the authors of the lives of the prophets, he was of the tribe of Simeon, and a native of Bethzacar.

HABEAS CORPUS, in law, is a writ of two kinds; the one being the great writ of the Engliſh liberty, which lies where a perſon is indicted for any crime or treſpaſs before juſtices of the peace, or in a court of any franchiſe, and on being impriſoned has offered ſufficient bale, which has been refuſed, though the caſe be bailable; in which caſe he may have this writ out of the king's bench, in order to remove himſelf thither, to anſwer the cauſe at the bar of that court.

The practice in this caſe is, firſt to procure a certiorari out of the court of chancery, directed to all the juſtices for removing the indictment into the king's bench; and upon that to obtain this writ, directed to the ſheriff, for cauſing the body of the party to be brought at a certain day.

The other kind of habeas corpus is uſed for bringing the body of a perſon into court, who is committed to any goal or priſon, either in civil or criminal cauſes; which writ will remove the perſon and cauſe from one court and priſon to another.

No habeas corpus, or other writ, to remove a cauſe

from

from out of an inferior court, can be allowed, if the ſame be not delivered to the judge of the court, before the jury who are to try the cauſe have appeared, and before any of them are ſworn, 43 Eliz. c. 5.

The habeas corpus act, 31 Car. II. c. 2. has ordained, that a perſon may have a habeas corpus from any judge, on complaint made and view of the warrant of commitment, (except ſuch perſon is committed for treaſon or felony expreſſed in the warrant, or ſome other offence that is not bailable) which habeas corpus muſt be made returnable immediately; and on producing a certificate of the cauſe of commitment, the priſoner is to be diſcharged on bail given to appear in the court of king's bench the next term, or next aſſizes, *&c.* Perſons committed, for either treaſon or felony, expreſsly mentioned in the warrant, upon a motion made in open court, in the firſt week of the term, or day of ſeſſions, *&c.* after commitment, are to be brought to trial; and if they are not indicted the next term or ſeſſions after commitment, on a motion made the laſt day of that term, they ſhall be let out upon bail, except it appear on oath, that the king's witneſſes are not ready; and in caſe they are not indicted or tried the ſecond term after commitment, they ſhall be diſcharged.

Judges denying a habeas corpus, ſhall forfeit 500 l. and if an officer refuſe to obey it, or to deliver a true copy of the commitment-warrant, he forfeits 100 l. for the firſt offence.

HABIT, in philoſophy, an aptitude or diſpoſition either of mind or body, acquired by a frequent repetition of the ſame act.

HABIT, in medicine, denotes the ſettled conſtitution of the body, or the habitude of any thing elſe, as the ſtructure or compoſition of a body, or the parts thereof.

HABIT is alſo uſed for a dreſs or garb, or the compoſition of garments, wherewith a perſon is covered; in which ſenſe we ſay, the habit of an eccleſiaſtic, of a religious, *&c.* a military habit, *&c.*

HABITE AND REPUTE, in Scots law, the common opinion of the people, among whom a perſon lives, with reſpect to any circumſtance relating to him.

HABITUAL, ſomething grown to a habit by long uſe. See HABIT.

HABITUDE, among ſchoolmen, the reſpect or relation one thing bears to another. See RELATION.

HACHA, a town of terra firma, in South America, ſituated on the north ſea, at the mouth of the river Hacha, in W. long. 72°, N lat. 11° 0′.

HACKNEY, a village on the north-eaſt ſide of London, with a handſome church, three meeting-houſes, and ſeventeen alms-houſes.

HADDINGTON, a parliament-town in Scotland, about eighteen miles eaſt of Edinburgh.

HADDOCK, the Engliſh name of a well known fiſh of the gadus kind. See GADUS.

HADRAMUT, a city of Arabia Felix, the capital of the province of Hadramut, ſituated in E. long. 50° 30′, N. lat. 16°, three hundred and ſixty miles north-eaſt of Mocho.

HÆMAGOGOS, among phyſicians, a compound medicine conſiſting of fetid and aromatic ſimples, mixed with black hellebore; and preſcribed in order to promote the menſtrual and hæmorrhoidal fluxes, as alſo to bring away the lochia.

HÆMANTHUS, in botany, a genus of the hexandria monogynia claſs. The involucrum is large, and conſiſts of ſix leaves; the corolla is above the fruit, and divided into ſix parts; and the berry has three cells. There are four ſpecies, none of them natives of Britain.

HÆMATITES, or BLOOD-STONE, in natural hiſtory, an extremely rich and fine iron.

It is very ponderous, and is either of a pale red, a deeper red, or a bluiſh colour; uſually of a very gloſſy ſurface; and when broken, of a fine and regularly ſtriated texture; the ſtriæ converging toward the centre of the body; and the maſſes thereof naturally breaking into fragments of a broad baſe and pointed end; appearing ſomething pyramidal. The hæmatites is various in its degrees of purity and hardneſs, as well as in its figure: the fineſt and moſt pure is of a botryoide ſurface; the whole ſuperficies riſing into larger or ſmaller roundiſh tubercles: ſometimes the hæmatites is of a coarſe texture, and a laxer ſtructure, in which ſtate it is known to many by the name ſchiſtus.

HÆMATOPUS, the SEA-PYE, in ornithology, a genus belonging to the order of grallæ. The beak is compreſſed with an equal wedge-ſhaped point; the noſtrils are linear; and the feet have three toes without nails. There is but one ſpecies, *viz.* the aſtralegus, a native of Europe and America. It feeds upon ſhell-fiſh near the ſea ſhores.

HÆMATOXYLUM, CAMPECHE-WOOD, in botany, a genus of the decandria monogynia claſs. The calix is divided into five parts; the petals are five; the capſule is lanceolated, and contains one cell with two boat-ſhaped valves. There is but one ſpecies, *viz.* the campechianum, campechy or logwood, a native of America, near Carthagena. It is uſually brought home in large logs, very hard, of a red colour, and an aſtringent ſweet taſte. It has been long uſed by the dyers, but not till very late as a medicine: an extracted decoction of it are ſaid to be ſerviceable in diarrhœas.

HÆMOPTOSIS, HÆMAPTYSIS, or HÆMOPTOE, in medicine, a ſpitting of blood. See MEDICINE.

HÆMORRHAGE, in medicine, a flux of blood from any part of the body. See MEDICINE.

HÆMORRHOIDAL, an appellation given by anatomiſts to the arteries and veins going to the inteſtinum rectum. See ANATOMY, Part III. and IV.

HÆMORRHOIDS, or PILES, in medicine, an hæmorrhage, or flux of blood from the hæmorrhoidal veſſels. See MEDICINE.

HAERLEM, a populous city of the United Provinces, in the province of Holland, ſituated near the lake which from this town is called Haerlem-Meer; four miles eaſt of the ocean, and twelve weſt of Amſterdam: E. long. 4° 20′. N. lat. 52° 30′.

HAGAI, a canonical book of the Old Teſtament, ſo called

called from the prophet of that name, who, in all probability was born at Babylon, from whence he returned with Zerubbabel.

HAGENAU, a fortified town of Germany, in the Landgraviate of Alſace: E. long. 7° 40′, N. lat. 48° 45′.

HAGUE, a town of the United Provinces, in the province of Holland, ſituated two miles eaſt of the ſea, and fourteen north-weſt of Rotterdam. This is one of the fineſt towns in Europe; but though it enjoys all the privileges of a city of Holland, except that of ſending repreſentatives to the ſtate, yet, as it has no walls, it is only eſteemed a village. Here every city of the United provinces has a houſe for their reſpective deputies, and here the ſtates of the province of Holland aſſemble, and all public affairs are tranſacted.

HAIL, in phyſiology, an aqueous concretion, in form of white or pellucid ſpherules, deſcending out of the atmoſphere.

Hail is evidently no other than drops of rain congealed into ice. This happens when in their paſſage thro' the inferior air, they meet with nitrous particles, which are known to contribute greatly to freezing. Their magnitude is owing to a freſh acceſſion of matter as they paſs along. Hence we ſee the reaſon why hail is ſo frequent in ſummer, becauſe at that time greater quantities of nitre are exhaled from the earth, and float up and down the air. See Rain and Frost.

HAIMSUCKEN, in Scots law, the aſſaulting or beating a man in his own houſe. See Scots Law, title 33.

HAIR, ſlender, oblong, and flexible filaments, growing out of the pores of animals, and ſerving moſt of them as a covering. See Anatomy, p. 256.

HAKE, in ichthyology. See Gadus.

HALBERSTAT, a city of Germany, in the circle of Upper Saxony, the capital of the duchy of the ſame name; ſubject to the king of Pruſſia, E. long. 11° 6′, N. lat. 51° 55′.

HALCRYPTIUM, a name given by Dr Hill to the ſalt ſuſpended in a fluid form, and in very ſmall quantities in mineral waters, ſcarce diſcernable by the taſte, and with much difficulty ſeparable from them.

HALCYON, in ornithology, a name given by the ancients to the alcedo, or kings-fiſher. See Alcedo.

Halcyon days, in antiquity, a name given to ſeven days before and as many after the winter ſolſtice; by reaſon the halycon, invited by the calmneſs of the weather, laid its eggs in neſts build in the rocks, cloſe by the brink of the ſea, at this ſeaſon.

HALE, in the ſea-language, ſignifies pull; as, to hale up, is to pull up; to hale in or out, is to pull in or out. To over-hale a rope, is to hale it too ſtiff, or to hale it the contrary way.

Keel-Hale. See Ducking.

HALEM, a town of the Auſtrian Netherlands, in the province of Brabant, twenty-five miles weſt of Maeſtricht: E long. 5° 5′, N. lat. 51° 5′.

HALESWORTH, a market town of Suffolk, thirty-five miles eaſt of Bury: E. long. 1° 40′, N. lat. 52° 30′.

HALF-BLOOD, in law, is where a man marries a ſecond wife, the firſt being dead, and by the firſt venter has a ſon, and by his ſecond venter has likewiſe a ſon, the two brothers, in this caſe, are but of half blood.

HALF merk, a noble, or 6 s. 8 d.

HALF moon, in fortification, an outwork compoſed of two faces, forming a ſaliant angle, whoſe gorge is in form of a creſcent, or half moon; whence the name. See Fortification.

HALIÆTUS, in ornithology. See Falco.

HALIOTIS, the ear-shell, a genus of inſects belonging to the order of Vermes teſtacea. This is an animal of the ſnail-kind, with an open ſhell reſembling an ear. There are ſeven ſpecies, diſtinguiſhed by the figure of their ſhells.

HALL, in geography, a town of Germany, in the circle of Auſtria, and county of Tyrol, ſituated ſix miles north eaſt of Inſpruck: E. long. 11° 28′, N. lat. 47° 15′.

Hall is alſo a town of the Auſtrian Netherlands in the province of Brabant, ſeven miles ſouth of Bruſſels: E. long. 4° 10′, N. lat. 50° 50′.

Hall is alſo a city of Germany, in the circle of Upper Saxony, in the capity of a duchy ſituated on the river Sala, ſubject to the king of Pruſſia: E. long. 12° 5′, N. lat. 51° 35′.

Hall is alſo a town of Germany, in the circle of Swabia, twenty miles eaſt of Hailbron; being an imperial city, or ſovereign ſtate: E. long. 9° 45′, N. lat. 49° 20′.

HALLAGE, a fee or toll paid for cloth brought to be ſold in Blackwell-hall, London.

HALLAMASS. See All-Saints.

HALLELUJA, a word ſignifying, praiſe the Lord.

The ſinging halleluja was a ſort of invitatory, or call to each other, to praiſe the Lord.

St Auſtin ſays, that in ſome churches, it was ſung only on Eaſter-day, and the fifty days of Pentecoſt; but that even in thoſe churches where it was moſt in uſe, it was never uſed in the time of lent.

HALLEN, a town of the Auſtrian Netherlands, in the province of Brabant: E. long. 5°, N. lat. 50° 55′.

HALLEIN, a town of Germany, in the archbiſhopric of Saltzburg: E. long. 13° 6′, N. lat. 47° 36′.

HALLER, a town in the Netherlands, in the province of Brabant: E. long. 5°, N. lat. 50° 40′.

HALLERIA, in botany a genus of the didynamia angioſpermia claſs. The calix has three ſegments, and the corolla four, the filaments are longer than the corolla; and the berry has two cells. There is but one ſpecies, a native of Æthiopia.

HALLIFAX, a large market town in the weſt riding of of Yorkſhire, thirty-four miles ſouth-weſt of York: W. long. 1° 40′, N. lat. 53° 45′.

HALMSTAT, a port town of Gothland in Sweden, eighty miles ſouth of Gottenberg: E. long. 13° 5′, N. lat. 56° 45′.

HALO, a meteor in the form of a luminous ring or circle, of various colours, appearing round the bodies of the ſun, moon, or ſtars.

Concerning the production of halos, Sir Iſaac Newton intimates, that they are formed by the light which

which comes through the drops of rain, by two refractions, without any reflection; but how this may be, is not eafy to conceive.

HALTWESEL, a market-town of Northumberland, thirty-two miles weft of Newcaftle: W. long. 2°, N. lat. 55°.

HAM, in anatomy, the part behind the knee.

HAM, in geography, a city in Germany, in the circle of Weftphalia, and the capital of the county of Mark, fubject to Pruffia: E. long. 7° 15, N. lat. 51° 35′.

HAMA, or APAMEA. See APAMEA.

HAMADAN, a city of Perfia, in the province of Eyrac Agem, 200 miles north-weft of Ifpahan; E. long. 47° 35′, N. lat 35°.

HAMADRYADS, in heathen theology, certain rural deities; being nymphs of the woods, whofe fate depended upon certain trees, together with which they were fuppofed both to be born and to die.

HAMAMELIS, in botany, a genus of the tetrandria digynia clafs. The involucrum confifts of three leaves, and the proper calix of four; the petals are four; and the nut has two cells. There is but one fpecies, a native of Virginia.

HAMAXOBIANS, *hamaxobii*, an ancient people of Europian Sarmatia, fo called from their living together in chariots or waggons, for the conveniency of fhifting the place of their abode at pleafure.

HAMBURGH, a large city and well fortified port town of Germany, in the circle of Lower Saxony, and duchy of Holftein, fituated on the north fide of the river Elb, partly on iflands, and partly on the continent. It is an imperial city, or fovereign ftate, governed by its own magiftrates, and fubject only to the general laws of the empire. Merchants from all parts of Europe refort to it, from whence their goods are fent into the heart of the empire: E. long. 9° 40′, N. lat. 54°.

HAMCHEU, the capital of the province of Chekiam, in China, fituated on the river Cienton, 160 miles fouth-eaft of Nanking: E. long. 120°, N. lat. 30°.

HAMELIN, a town of Germany, in the circle of lower Saxony, and duchy of Brunfwic, fubject to the elector of Hanover: E. long. 9° 12′, N. lat. 52° 15′.

HAMILTON, a town of Scotland, in the county of Clydefdale, fituated on the river Clyde, eleven miles fouth-eaft of Glafgow: W. long. 3° 50′, N. lat. 55° 40′.

HAMLE, the name of the eleventh month of the Ethiopian year, beginning on the 25th of June, old ftyle.

HAMMONT, a town of Germany, in the circle of Weftphalia, and bifhopric of Liege, fituated near the confines of Brabant: E. long. 5° 32′, N. lat. 51° 20′.

HAMPSHIRE, an Englifh country, bounded by Berkfhire, on the north; by Surry and Suffex, on the eaft; by the Englifh channel, on the fouth; and by Wiltfhire and Dorfetfhire, on the weft. It comprehends the ifle of Wight. Its chief towns are Winchefter, Southampton, and Portfmouth.

New HAMPSHIRE, a province of New England, in North America, bounded by Nova Scotia, on the north; by the Atlantic ocean, on the eaft; by the province of Maffachufets bay, on the fouth; and by New York, on the weft: fubject to Great Britain.

HAMPSTEAD, a pleafant village in Middlefex, four miles north of London.

HAMPTON, a market-town of Gloucefterfhire, twelve miles fouth of Gloucefter: W. long. 2° 15. N. lat. 51° 38′.

HAMPTON-COURT, a town in Middlefex, fituated on the north fide of the Thames, twelve miles weft of London, and two weft of Kingfton; in which is the fineft palace belonging to the king of Britain.

HANAU, the capital of a county of the fame name in Germany, is pleafantly fituated on the river Kunts, thirteen miles eaft of Frankfort, and twelve north-weft of Afchaffenburgh: E. long. 8° 45′. N. lat. 50° 12′.

HAND, in anatomy. See ANATOMY, Part I. II. *&c.*

HAND, in the manege, a meafure of four inches, or of a clinched fift, by which the height of a horfe is computed.

HAND-BREADTH, a meafure of three inches.

HANDS, in heraldry, are borne in coat armour dexter and finifter, that is, right and left, expanded or open. Thefe are the moft neceffary parts of the human body, as they ferve to exprefs all forts of actions, and even our very thoughts and defigns; thus, joining of hands is an univerfal token of friendfhip, and clapping of hands a general mark of applaufe.

HANOVER, a city of Germany, in the circle of Lower Saxony, and dukedom of Brunfwic, fituated on the river Leina, thirty-fix miles weft of Brunfwic: it is the capital of his Britannic majefty's German dominions, fituated in E. long. 9° 45′. N. lat. 52° 32′.

HANSE, or HANS, a company of merchants united for the promotion and advantage of trade.

HANSE-TOWNS, port-towns of Germany of which Lubec and Hamburgh were the chief. They were formerly all of them imperial cities, confederated for their mutual defence, and the protection of their trade.

HAPPINESS, among philofophers, confifts in the profecution or enjoyment of fome good.

HARBINGER, an officer of the king's houfhold, having four yeomen under him, who ride a day's journey before the court, when it travels, to provide lodgings, *&c.*

HARBOROUGH, a town of Leicefter fhire, thirteen miles fouth-eaft of Leicefter: W. long. 1°. N. lat. 52°. 26′.

HARBOUR, a place where fhips may ride fafe at anchor, chiefly ufed in fpeaking of thofe fecured by a boom and chain, and furnifhed with a mole.

HARBURGH, a port town of Germany, in the circle of Lower Saxony, and duchy of Lunenburg, fituated on the river Elbe, oppofite to Hamburgh: E. long. 9° 30′. N. lat. 53° 57′.

HARCOURT, a town of France, in the province of Normandy, twenty-three miles fouth-weft of Rouen.

HARDENING, the giving a greater degree of hardnefs to bodies than they had before.

There are feveral ways of hardening iron and fteel, as by hammering them, quenching them when hot in cold water, *&c.* CHEMISTRY, p. 134.

HARDERWICK,

HARDERWICK, a town of Guelderland, in the United Netherlands, twenty-three miles north-west of Zutphen: E. long. 5° 30′. N. lat. 52° 35′.

HARDNESS, in physiology, that quality in bodies whereby their parts cohere firmly together, so as not to give way to any external impulse, nor yield inwards, without breaking.

In this sense hardness coincides with what on other occasions we call firmness, in opposition to softness and fluidity.

HARE, in zoology. See LEPUS.

HARE-LIP, in surgery. See SURGERY.

HARENGUS. See CEUPEA.

HARFLEUR, a port-town of France, in the province of Normandy, situated near the mouth of the Seyne, four miles west of Havre de Grace: E. long. 15° N. lat. 49° 30′.

HARIOT, or HERIOT, in law, a due belonging to a lord at the death of his tenant, consisting of the best beast, either horse, ox, or cow, which he had at the time of his death; and in some manors, the best goods, piece of plate, *&c.* are called hariots.

HARLEBECK, a town of the Austrian Netherlands, in the province of Flanders, situated on the river Lys, six miles north-east of Courtray: E. long. 3° 15′, N. lat. 50° 50′.

HARLEQUIN, a buffoon or merry andrew; but is now used for a person of extraordinary agility, dressed in party-coloured cloaths, the principal character in a pantomime entertainment. See PANTOMIME.

HARLESTON, a market-town of Norfolk, situated on the river Waveney, fourteen miles south of Norwich: E. long. 1° 25′, N. lat. 52° 35′.

HARLINGEN, a port-town of the United Netherlands, in the province of West Friesland, situated on the German sea: E. long 5° 20′, N. lat. 53° 15′.

HARLOW, a market-town of Essex, situated fifteen miles west of Chelmsford: E. long. 6′, N. lat. 51° 45′.

HARMONICAL, something belong to harmony. See HARMONY

HARMONICAL COMPOSITION, in a general sense, includes both harmony and melody, *i. e.* of music or songs, both in a single part, and in several parts.

HARMONICAL SERIES, a series of many numbers in continual harmonical proportion. Thus, if there are four or more numbers, of which every three immediate terms are harmonical, the whole will make an harmonical series: such is 30 : 20 : 15 : 12 : 10. Or, if every four terms immediately next each other are harmonical, it is also a continual harmonical series, but of another species, as 3, 4, 6, 9, 18, 36, *&c.*

HARMONICAL SOUNDS, an appellation given, by Mr Sauveur, to such sounds as always make a determinate number of vibrations, in the time that one of the fundamentals, to which they are referred, makes one vibration.

Harmonical sounds are produced by the parts of chords, *&c.* which vibrate a certain number of times, while the whole chord vibrates once.

The relations of sounds had only been considered in the series of numbers, 1 : 2, 2 : 3, 3 : 4, 4 : 5, *&c.* which produced the intervals called octave, fifth, fourth, third, *&c.* Mr Sauveur first considered them in the natural series, 1, 2, 3, 4, 5, *&c.* and examined the relations of sounds arising therefrom. The result is, that the first interval, 1 : 2, is an octave; the second, 1 : 3, a twelfth; the third, 1 : 4, a fifteenth, or double octave; the fourth, 1 : 5, a seventeenth; the fifth, 1 : 6, a nineteenth, *&c.*

This new consideration of the relations of sounds is more natural than the old one; and is, in effect, all the music that nature makes without the assistance of art.

HARMONICS, that part of music which considered the differences and proportions of sounds, with respect to acute and grave; in contradistinction to rythmica and metrica.

HARMONY, in music, the agreeable result or union of several musical sounds heard at one and the same time; or the mixture of divers sounds, which together have an effect agreeable to the ear.

HARMONY *of the spheres*, or *Celestial* HARMONY, a sort of music much talked of by many of the ancient philosophers and fathers, supposed to be produced by the sweetly tuned motions of the stars and planets. This harmony they attributed to the various proportionate impressions of the heavenly globes upon one another, acting at proper intervals. It is impossible, according to them, that such prodigious large bodies, moving with so much rapidity, should be silent; on the contrary, the atmosphere continually impelled by them, must yield a set of sounds proportionate to the impression it receives; consequently, as they do not all run the same circuit, nor with one and the same velocity, the different tones arising from the diversity of motions, directed by the hand of the Almighty, must form an admirable symphony, or concert.

They therefore supposed, that the moon, as being the lowest of the planets, corresponded to *mi*; mercury, to *fa*; venus, to *sol*; the sun, to *la*; mars, to *si*; jupiter, to *ut*; saturn, to *re*; and the orb of the fixed stars, as being the highest of all, to *mi*, or the octave.

HARP, a musical instrument of the string-kind, of a triangular figure, held upright between the legs of the person who plays upon it.

HARPIES, among the ancient poets, fabulous impure monsters, said to be the daughters of Neptune and Earth. Virgil mentions three of them, Aello, Ocypete, and Celœno; they are described to be fowls, with the face of a virgin, bears ears, their bodies like vultures, and hands like their crooked talons.

HARPINEER, or HARPONEER, the person who manages the harping-iron.

HARPSICHORD, the most harmonious of all the musical instruments of the string-kind. It is played on after the manner of the organ, and is furnished with a set, and sometimes with two sets of keys; the touching or striking of these keys moves a kind of little jacks, which

which alſo move a double row of chords or ſtrings, of braſs or iron, ſtretched over four bridges on the table of the inſtrument.

HARQUEBUSS, a piece of fire-arms, of the length of a muſket, uſually cocked with a wheel. It carried a ball that weighed one ounce ſeven eighths.

There was alſo a larger ſort, called the great harquebuſs, uſed for the defence of ſtrong places, which carried a ball of about three ounces and a half: but they are now but little uſed, except in ſome old caſtles, and by the French in ſome of their garriſons.

HARRIER, a kind of hound, endowed with an admirable gift of ſmelling, and very bold in the purſuit of his game.

HARROW, in agriculture. See AGRICULTURE, p. 58.

HART, a ſtag, or male deer, in the ſixth year. See CERVUS.

HART's HORNS, in pharmacy, the whole horns of the common male deer, as ſeparated from the head, without farther preparation.

The chemical analyſis of hart's-horn is ſufficiently known: it yields a water highly impregnated with a volatile ſalt, which is called ſpirit of hart's-horn, with a fetid oil, and a volatile ſalt by the common diſtillation in a retort.

The ſalt of hart's horn is a great ſudorific, and is given in fevers of many kinds with great ſucceſs; the ſpirit has the ſame, and all the other virtues of volatile alkalis, and is uſed to bring people out of faintings by its pungency, on holding it under their noſe, and at the ſame time pouring ſome drops of it in water down the perſon's throat.

HART-WORT, in botany. See TORDYLLIUM.

HARTFORD, the capital of Hartfordſhire, ſituated twenty-one miles north of London: W. long. 7′, and N. lat. 51° 45′.

HARTFORD is alſo a town of New England, in the province of Connecticut, ſituated 50 miles weſt of Boſton: W. long. 71° 15′, and N. lat. 42°.

HARTLAND, a market-town of Devon, ſituated near the Briſtol channel; it gives name to a cape, called Hartland-point, at the entrance of the Briſtol channel: W. long. 4° 45′, and N. lat. 51° 9′.

HARTLEPOOL, a port-town of the county of Durham, ſituated on the German ocean, fourteen miles ſouth-eaſt of Durham: W. long. 55′, and N. lat. 54° 40′.

HARVEST, the time or ſeaſon that the corn is ripe, and fit to be reaped and taken into barns.

HARWICH, a borough and port-town of Eſſex, ſixty-two miles north-eaſt of London: E. long. 1° 25′, N. lat. 52° 5′. It ſends two members to parliament.

HASLEM, an iſland of Denmark, in the Categate-ſea, north of the iſland of Zealand.

HASLEMERE, a borough-town of Surry, thirty eight miles ſouth-weſt of London, and ten miles ſouth-weſt of Guildford. It ſends two members to parliament.

HASSELT, a town of Weſtphalia, in Germany, fifteen miles north-weſt of Maeſtricht.

HASSIDEANS, or ASSIDEANS, an appellation given to thoſe Jews who reſorted to Mattathias, to fight for the law of God, and the liberties of their country.

HASSOCK, a baſs made of ruſhes, to kneel or reſt the feet upon in churches.

HASP and STAPLE, in Scots law, the ſymbol commonly uſed in burgage tenements for entering and infefting an heir, by delivering into his hands the haſp and ſtaple of the door. See SCOTS LAW, title 27.

HASTA, among medalliſts, a kind of javelin, not ſhod or headed with iron; or rather an ancient ſort of ſceptre, longer than ordinary, occaſionally given to all the gods.

HASTATED LEAF. See BOTANY, p. 639.

HASTINGS, a borough-town of Suſſex, ſituated on the coaſt of the Engliſh channel, fifty miles ſouth-eaſt of London: E. long. 36′, and N. lat. 50° 50′.

HAT, a covering for the head, worn by the men in moſt parts of Europe. Thoſe moſt in eſteem are made of the pure hair of the caſtor or beaver; for they are alſo made of the hair or wool of divers other animals, and that by much the ſame proceſs.

Method of making HATS. To make the beaver-hats, they tear off the long and ſhort hair from the ſkin, with knives ſuitable to the occaſion: after which they proportion the quantity of the ſeveral ſorts of beaver-hair, by mixing one third of the dry caſtor to two thirds of old-coat, which is a term for a ſkin that has been worn ſome time by the Indians of America, who catch and ſell them to the Europeans. The hair, ſo mixed, is carded and weighed out into parcels, according to the ſize and thickneſs of the hat intended. The ſtuff is now laid on the hurdle, with an inſtrument called a bow, reſembling that of a violin, but larger; whoſe ſtring being worked with a ſmall bow-ſtick, and made to play on the furs, they fly, and mix themſelves together, the duſt and filth at the ſame time paſſing through the chinks. Inſtead of a bow, ſome hat-makers uſe a ſearce of hair, through which they paſs the ſtuff. Thus hats are formed of an oval figure, ending with an acute angle at the top: with what ſtuff remains, they ſtrengthen them where ſlendereſt, yet deſignedly make them thicker in the brim near the crown, than towards the circumference, or in the crown itſelf. They next harden the ſtuff, ſo managed, into more compact flakes, by preſſing down a hardened leather upon it. This done, they are carried to the baſon, upon which laying one of the hardened hats, they ſprinkle it over with water, and mould it; and the heat of the fire, with the water and preſſing, imbody the ſtuff into a ſlight hairy ſort of felt; after which, turning up the edges all round over the mould, they lay it by, and proceed with another; which being in like manner reduced to the ſame conſiſtence and form, they are both joined together, ſo as to make them meet in an angle at top, making only one conical cap. The next proceſs is to remove the hat to a trough, reſembling a mill-hopper, which is a copper kettle filled with water and grounds, kept hot for the purpoſe; and, after being dipped in the kettle, the hat is laid on the ſloping ſide, called the plank. Here they proceed to work it, by rolling and unrolling it

again and again, one part after another, firft with the hand, and afterwards with a fmall wooden roller, taking care to dip it from time to time, till at length, by thus fulling and thickening it four or five hours, it is brought to the dimenfions intended. In this violent labour, the workmen ufually guard their hands with thick leather, which they call gloves. The hat thus wrought into the form of a conical cap, is reduced into proper fhape on a block of the fize of the intended crown, by tying it round with a ftring, called a commander; after which, with a bent iron, called a ftamper, they gradually beat down the commander all round, till it has reached the bottom of the block, and what remains at the bottom below the ftring forms the brim. In this ftation it is fet to dry, and afterwards finged, by holding it over the blaze of a fire, made of ftraw, or fhavings: it is then rubbed with pumice-ftone, to take off the coarfer nap; then rubbed over with feal fkin, to lay the nap ftill finer; and, laftly, carded with a fine card, to raife the fine cotton, with which the hat is to appear when finifhed: then fitting it to the block, they tie it, cut round the edges, and deliver it to the dyers. (See DYING.) The dye being completed, the hat is dried by being hung in the roof of a ftove heated with a charcoal-fire; and, when dry, it is ftiffened with melted glue, or rather gum-fenega, which is fmeared over the hat with a brufh, and rubbed in with the hand. Then, having fpread a cloth over the fteaming bafon, which is a little fire-place raifed about three feet high, with an iron plate laid over it, exactly covering the fire, the hat is laid uoon the cloth, with the brim downwards, the cloth being firft fprinkled with water, to raife a ftrong fteam, to force in the ftiffening. When it is moderately hot, the workman ftrikes gently on the brim, with the flat of his hand, to make the joinings incorporate and bind fo as not to appear, turning it from time to time, and at laft fetting it on the crown. And when it has been fufficiently fteamed and dried, it is put again on the block, brufhed, ironed, well fmoothed, and fitted for lining.

Hats make a confiderable article in commerce: England fupplies Spain, Portugal, Italy, and Germany, with extraordinary quantities of them; and as our manufacturers have the reputation of making the beft hats in Europe, their importation is prohibited.

HATS are alfo made for womens wear, of chips, ftraw, or cane, by platting, and fewing the plats together; beginning with the centre of the crown, and working round till the whole is finifhed. Hats for the fame purpofe are alfo wove and made of horfe-hair, filk, *&c.*

HATCHEL, or HITCHEL, a tool with which flax and hemp are combed into fine hairs. It confifts of long iron pins, or teeth, regularly fet in a piece of board.

HATCHES, in a fhip, a kind of trap-doors between the main-maft and fore-maft, through which all goods of bulk are let down into the hold.

HATCH-WAY, the place where the hatches are. Thus, to lay a thing in the hatch way, is to put it fo, that the hatches cannot be come at, or opened.

HATCHING, the maturating fecundated eggs, whether by the incubation and warmth of the parent-bird, or by artificial heat, fo as to produce young chickens alive.

The art of hatching chickens by means of ovens has long been practifed in Egypt; but it is there only known to the inhabitants of a fingle village named Berme, and to thofe that live at a fmall diftance from it. Towards the beginning of autumn they fcatter themfelves all over the country, where each perfon among them is ready to undertake the management of an oven, each of which is of a different fize, but in general they are capable of containing from forty to fourfcore thoufand eggs. The number of thefe ovens placed up and down the country is about three hundred and eighty fix, and they ufually keep them working for about fix months: as therefore each brood takes up in an oven, as under a hen, only twenty-one days, it is eafy in every one of them to hatch eight different broods of chickens. Every Bermean is under the obligation of delivering to the perfon who intrufts him with an oven, only two thirds of as many chickens as there have been eggs put under his care; and he is a gainer by this bargain, as more than two thirds of the eggs ufually produce chickens. In order to make a calculation of the number of chickens yearly fo hatched in Egypt, it has been fuppofed, that only two thirds of the eggs are hatched, and that each brood confifts of at leaft thirty thoufand chickens; and thus it would appear, that the ovens of Egypt give life yearly to at leaft ninety-two millions fix hundred and forty thoufand of thefe animals.

This ufeful and advantageous method of hatching eggs has been lately difcovered in France, by the ingenious Mr Reaumur, who, by a number of experiments, has reduced the art to certain principles. He found by experience that the heat neceffary for this purpofe is nearly the fame with that marked 32 on his thermometer, or that marked 96 on Farenheit's. This degree of heat is nearly that of the fkin of the hen, and, what is remarkable, of the fkin of all other domeftic fowls, and probably of all other kinds of birds. The degree of heat which brings about the developement of the cygnet, the gofling, and the turkey-pout, is the fame as that which fits for hatching the canary-fongfter, and, in all probability, the fmalleft humming bird: the difference is only in the time during which this heat ought to be communicated to the eggs of different birds: it will bring the canary bird to perfection in eleven or twelve days, while the turkey-pout will require twenty feven or twenty-eight.

After many experiments, Mr Reaumur found that ftoves heated by means of a baker's oven, fucceeded better than thofe made hot by layers of dung: and the furnaces of glafs-houfes, and thofe of the melters of metals, by means of pipes, to convey heat into a room, might, no doubt, be made to anfwer the fame purpofe. As to the form of the ftoves, no great nicety is required; a chamber over an oven will do very well; nothing more will be neceffary but to afcertain the degree of heat, which may be done by melting a lump of butter, of the fize of a walnut, with half as much tal-

low, and putting it into a phial; this will ferve to indicate the heat with fufficient exactnefs, for when it is too great, this mixture will become as liquid as oil, and when the heat is too fmall, it will remain fixed in a lump; but it will flow like a thick fyrup, upon inclining the bottle, if the ftove be of a right temper: great attention therefore fhould be given to keep the heat always at this degree, by letting in frefh air, if it be too great, or fhutting the ftove more clofe, if it be too fmall; and that all the eggs in the ftove may equally fhare the irregularities of the heat, it will be neceffary to fhift them from the fides to the centre; thereby imitating the hens, who are frequently feen to make ufe of their bills, to pufh to the outer parts thofe eggs that were neareft to the middle of their nefts, and to bring into the middle fuch as lay neareft the fides.

Mr Reaumur has invented a fort of low boxes, without bottoms, and lined with furs. Thefe, which he calls artificial parents, not only fhelter the chickens from the injuries of the air, but afford a kindly warmth, fo that they prefently take the benefit of their fhelter as readily as they would have done under the wings of a hen. After hatching, it will be neceffary to keep the chickens, for fome time, in a room artfully heated and furnifhed with thefe boxes; but afterwards they may be fafely expofed to the air in the court yard, in which it may not be amifs to place one of thefe artificial parents to fhelter them if there fhould be occafion for it.

As to the manner of feeding the young brood, they are generally a whole day after being hatched, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, after which they will begin to pick up infects and grafs for themfelves.

But to fave the trouble of attending them, capons may be taught to watch them in the fame manner as hens do. Mr Reaumur affures us, that he has feen above two hundred chickens at once, all led about and defended only by three or four fuch capons. Nay, cocks may be taught to perform the fame office, which they, as well as the capons, will continue to do all their lives after.

HATFIELD, a market-town of Hartfordfhire, fituated twenty miles north weft of London.

HATHERLY, a market-town of Devonfhire, twenty miles north weft of Exeter.

HATTEM, a town of Gelderland, one of the United Provinces: E. long 6°, N. lat. 52° 30′.

HATTOCK, a fhock of corn containing twelve fheaves: others make it only three fheaves laid together.

HATUAN, a town of Upper Hungary, fifteen miles north eaft of Buda: E. long. 19° 35′, and N. lat. 47° 48′.

HAVANNA, a port-town of the ifland of Cuba, in America, fituated at the entrance of the gulph of Mexico; fubject to Spain: W. long. 84°, and N. lat. 23°.

HAVANT, a market town of Hampfhire, fix miles north-eaft of Portfmouth.

HAVEL, a river of Brandenburg, in Germany, which receives the river Spree, near Berlin, and difcharges itfelf into the Elbe, a little below Havelburg.

HAVELBURG, a town of Germany, in the circle of Upper Saxony, and marquifate of Brandenburg, fubject to the king of Pruffia: E. long. 12° 44′, and N. lat. 53°.

HAVEN, a fea-port or harbour. See HARBOUR.

HAVERFORD WEST, a borough-town of Pembrokefhire, in fouth Wales, fituated twelve miles fouth eaft of St David's. It fends only one member to parliament.

HAUNCH, or HANCH, the hip, or that part of the body between the laft ribs and the thigh

HAVRE DE GRACE, is a port-town of France, in the province of Normandy, fituated on the Englifh channel, at the mouth of the river Seyne: E. long. 10′, and N. lat. 49° 30′.

HAUTBOY, a mufical inftrument of the wind-kind, fhaped much like the flute, only that it fpreads and widens towards the bottom, and is founded through a reed. The treble is two feet long; the tenor goes a fifth lower, when blown open: it has only eight holes; but the bafs, which is five feet long, has eleven.

HAW, a fort of berry, the fruit of feveral fpecies of mefpilus, thence denominated haw-thorns. See MESPILUS.

HAW, among farriers, an excrefcence refembling a griftle, growing under the nether eye-lid and eye of a horfe, which, if not timely removed, will put it quite out. See FARRIERY.

HAWK. See FALCO.

HAWKING, the exercife of taking wild-fowl by means of hawks.

HAWSER, in the fea-language, a large rope, or a kind of fmall cable, ferving for various ufes a-board a fhip, as to faften the main and fore fhrouds, to warp a fhip as fhe lies at anchor, and wind her up to it by a capftan, *&c.* The hawfer of a man of war may ferve for a cable to the fheet-anchor of a fmall fhip.

HAWSES, in a fhip, are two large holes under the bow, through which the cables run when fhe lies at anchor.

HAY, any kind of grafs, cut and dried, for the food of cattle.

The time of mowing grafs for hay, muft be regulated according to its growth and ripenefs; nothing being more prejudicial to the crop than mowing it too foon, becaufe the fap is not then fully come out of the root, and when made into hay, it fhrinks away to nothing. It muft not, however, be let ftand too long, till it have fhed its feeds. When the tops of the grafs look brown, and begin to bend down, and the red honey-fuckle flowers begin to wither, you may conclude it ripe for mowing.

St Foin HAY. See AGRICULTURE, p. 65.

HAY, in geography, a market-town in Brecknockfhire, fouth Wales, thirteen miles north-eaft of Brecknock.

HAYNAULT, a province of the Netherlands, bounded by Brabant and Flanders, on the north; by Namur and

and Liege, on the eaſt; by the Cambreſis, Picardy, and Champaign, on the ſouth; and by Artois, and another part of Flanders, on the weſt: the north part is ſubject to the houſe of Auſtria, and the ſouth part to France. Its capital is Mons.

HAYWARD, the perſon who keeps the common herd or cattle of a town.

HAZARD, a game on dice, without tables, is very properly ſo called; ſince it ſpeedily makes a man, or undoes him.

It is played with only two dice; and as many may play at it as can ſtand round the largeſt round table.

Two things are chiefly to be obſerved, *viz.* main and chance; the latter belonging to the caſter, and the former, or main, to the other gameſters. There can be no main thrown above nine, nor under five; ſo that five, ſix, ſeven, eight, and nine, are the only mains flung at hazard. Chances and nicks are from four to ten: thus four is a chance to nine, five to eight, ſix to ſeven, ſeven to ſix, eight to five; and nine and ten a chance to five, ſix, ſeven, and eight: in ſhort, four, five, ſix, ſeven, eight, nine, and ten, are chances to any main, if any of theſe nick it not. Now nicks are either when the chance is the ſame with the main, as five and five, or the like; or ſix and twelve, ſeven and eleven, eight and twelve. Here obſerve, that twelve is out to nine, ſeven, and five; eleven is out to nine, eight, ſix, and five; and ames-ace and duce-ace, are out to all mains whatever.

HAZLE, in botany. See CORYLUS.

HAZLE-EARTH, or HAZLEY EARTH, a kind of red loam, which is ſaid to be an excellent mixture with other ſorts of earth; uniting what is too looſe, cooling what is too hot, and gently entertaining the moiſture.

HEAD, in anatomy. See ANATOMY, Part I. II. *&c.*

HEAD-ACH, a moſt troubleſome ſenſation in the head, produced by various cauſes, and attended with different ſymptoms, according to its different degrees, and the place where it is ſeated. See MEDICINE.

Dragon's HEAD, in aſtronomy, *&c.* is the aſcending node of the moon, or other planet.

HEADFORD, a town of Galway, in Ireland, twelve miles north of the city of Galway.

HEALTH is a right diſpoſition of the body, and of all its parts; conſiſting in a due temperature, a right conformation, juſt connection, and ready and free exerciſe of the ſeveral vital functions.

HEAM, in beaſts, is the ſame with the ſecundines, or after-birth in women.

HEARING, the ſenſe whereby we perceive ſounds.

The organ of hearing is the ear, and particularly the auditory nerve and membrane. See ANATOMY, p. 295.

This membrane, in the various degrees of tenſion and relaxation, adapts itſelf to the ſeveral natures and ſtates of ſonorous bodies; becoming tenſe for the reception of acute ſounds, and relaxed for the admiſſion of grave ſounds. In ſhort, it is rendered tenſe and relaxed in a thouſand different degrees, according to the various degrees of acuteneſs or gravity in ſounds.

Sound, then, is in effect nothing but a certain modulation of the air, which being collected by the external ear, paſſes through the meatus auditorius, and beats upon the membrane of the tympanum, which moves the bones in the tympanum: theſe move the internal air, which finally communicates the motion to the auditory nerve, in the labyrinth and cochlea; and according as the vibrations are quick or ſlow, the ſound is either acute or grave.

It deſerves obſervation, that though the air be the uſual matter of ſounds; ſo that if a bell be hung in vacuo, it will not be heard at all; yet moſt other bodies, properly diſpoſed, will do its office, only ſome more faintly than others. Thus a ſound may be heard through water, or even through earth, of which there are various inſtances.

As the ſight is aſſiſted by ſpectacles, or other glaſſes; ſo the hearing is enlivened and rendered quick, by means of acouſtic inſtruments; which are of various figures, but for the moſt part bear ſome reſemblance to a trumpet, diverging and growing wider towards the external mouth.

HEARSE, among ſportſmen, a hind of the ſecond year of her age.

HEART, in anatomy. See ANATOMY, p. 278.

Force of the HEART. Several ingenious perſons have, from time to time, attempted to make eſtimates of the force of the blood in the heart and arteries; who have as widely differed from each other, as they have from the truth, for want of a ſufficient number of data to argue upon. This ſet the truly ingenious Dr Hales upon making proper experiments, in order to aſcertain the force of the blood in the veins and arteries of ſeveral animals.

If, according to Dr Keil's eſtimate, the left ventricle of a man's heart throw out in each ſyſtole an ounce or 1.638 cubic inches of blood, and the area of the orifice of the aorta be =0.4187; then dividing the former by this, the quotient 3.9 is the length of the cylinder of blood, which is formed in paſſing through the aorta in each ſyſtole of the ventricle; and in the ſeventy-five pulſes of a minute, a cylinder of 292.5 inches in length will paſs: this is at the rate of 1462 feet in an hour. But the ſyſtole of the heart being performed in one third of this time, the velocity of the blood in that inſtant will be thrice as much, *viz.* at the rate of 4386 feet in an hour, or 73 feet in a minute. And if the ventricle throws out one ounce in a pulſe, then in the ſeventy-five pulſes of a minute, the quantity of blood will be equal to 4.4 ℔ 11 oz. and, in thirty-four minutes, a quantity equal to a middle-ſized man, *viz.* 158 ℔. will paſs through the heart. But if, with Dr Harvey and Dr Lower, we ſuppoſe two ounces of blood, that is, 3.276 cubic inches, to be thrown out at each ſyſtole of the ventricle, then the velocity of the blood in entering the orifice of the aorta, will be double the former, *viz.* at the rate of 146 feet in a minute, and a quantity of blood equal to the weight of a man's body will paſs in half the time, *viz.* 17 minutes.

If we ſuppoſe, what is probable, that the blood will riſe $7+\frac{1}{2}$ feet high in a tube fixed to the carotide artery

tery of a man, and that the inward area of the left ventricle of his heart is equal to fifteen ſquare inches; theſe multiplied into $7+\frac{1}{2}$ feet, give 1350 cubic inches of blood, which preſſes on that ventricle, when it firſt begins to contract, a weight equal to 15.5 pounds.

What the doctor thus calculates, from ſuppoſition, with regard to mankind, he actually experimented upon horſes, dogs, fallow-does, *&c.* by fixing tubes, in orifices opened in their veins and arteries; by obſerving the ſeveral heights, to which the blood roſe in theſe tubes, as they lay on the ground; and by meaſuring the capacities of the ventricles of the heart, and orifices of the arteries. And, that the reader may the more readily compare the ſaid eſtimates together, he has given a table of them, ranged in the following order.

The ſeveral animals.	Weight of each.	Height of the blood in the tube from the jugular vein.	Height of the blood in tubes fixed to arteries.	Capacity of the left ventricle of the heart.	Area of the orifice of the aorta.	Velocity of the blood in the aorta.	Quantities of blood equal to the weight of the animal, in what time.	How much in a minute	Weight of the blood ſuſtained by the left ventricle contracting.	N° of pulſes in a minute.	Area of tranſverſe ſection of deſcending aorta.	Area of the tranſverſe ſection of aſcending aorta.
	Pounds. Ounces.	Inches.	Feet Inches.	Cubic inches.	Square inches.	Feet and inches in a minute.	Minutes.	Pounds.	Pounds.		Square inches.	Square inches.

HEAT, in phyſiology, one of the ſecondary qualities of bodies, produced by fire, and oppoſed to cold.

Under the article fire, we conſidered the ſun as the principal ſource of heat upon the earth's ſurface, and the confines of the earth and atmoſphere: without this, all the bodies upon our globe would doubtleſs grow rigid, lifeleſs, and fixed. It is this that ſtirs within them, as the main ſpring of their actions. Hence vegetation and animalization are evidently promoted; and hence the ocean and the atmoſphere continue in a fluid ſtate.

Heat in us is properly a ſenſation, excited by the action of fire; or it is the effect of fire on our organs of feeling. Hence it follows, that what we call heat is a particular idea or modification of our own mind, and not any thing exiſting in that form in the body that occaſions it. Heat, ſays Mr Locke, is no more in the fire that burns the finger, than pain is in the needle that pricks it. In effect, heat in the body that gives it, is only motion; and in the mind, only a particular idea.

Heat in the hot body, according to 'S Graveſande, is an agitation of the parts of the body, made by means of the fire contained in it: by ſuch an agitation a motion is produced in our bodies, which excites the idea of heat in our mind; ſo that heat in reſpect of us is nothing but that idea, and in the hot body nothing but motion. If ſuch motion expel the fire in right lines, it gives us the idea of light; if in a various and irregular motion, only heat.

Heat, with reſpect to our ſenſations, or the effect produced on us by a hot body, is eſtimated by its relation to the organ of feeling; no object appearing to be hot, unleſs its heat exceed that of our body. Whence the ſame thing to different perſons, or at different times to the ſame perſon, ſhall appear both hot and cold. The degree of heat is meaſured by the expanſion of the air, or ſpirit in the thermometer.

It

It has been juftly obferved, by fome of our modern philofophers, that actual or abfolute heat, is to fenfible or relative heat, the fame as motion is to velocity: for abfolute heat is nothing but the whole motion of all the parts of the ignited body; and fenfible or relative heat, refpects only the comparative velocity of the parts. Thus, equal bulks of mercury and water fet in a fand-heat, where the heat of the fire may be uniformly communicated to both, will acquire in equal times equal degrees of abfolute heat: but the relative heat of the water, or that which is fenfible to the finger, will be near 14 times as great as that of the mercury, becaufe the water, having 14 times a lefs quantity of matter, will admit of velocity fo much in proportion greater.

Again, if mercury and water have the fame relative or fenfible heat, that is, if both are heated in fuch a manner as to caufe an equal afcent in the thermometer, then a quantity of mercury will heat 14 times as much water as the fame quantity of water will do; or it will make the fame quantity of cold water 14 times hotter than the fame quantity of hot water can. All which is eafy to be fhewn by experiment, and abundantly proves, that heat and fire are wholly owing to the velocity of the parts of the heated or ardent body: on which theory the various phenomena of heat, cold, fire, burning, *&c.* are rationally accounted for. For, firft, we are to confider, that cold and heat are only comparative terms, or that the fame thing may either be too hot, or too cold, according to the relative idea or ftandard-degree. Thus, ice or fnow is faid to be cold with refpect to the finger, but ice or fnow is warm if compared to a freezing mixture; fo that if (as we commonly do) we make the hand or any part of the body the ftandard of heat or cold, or the term of comparifon; then it is evident, 1. If the parts of any body, applied to the hand, have the fame velocity as the parts of the hand, fuch a body we naturally pronounce is neither hot nor cold. 2. If the particles of the body have a greater velocity than thofe of the hand, we pronounce it warm, if the excefs be fmall; but hot, if it be great. 3. If the velocity of the parts of the body applied be lefs than that in the hand, the fenfation then is what we call cold, which alfo may be in various degrees. 4. Hence it is plain, there can be no fuch thing as abfolute cold, but where the particles of matter are abfolutely quiefcent or at reft. 5. Hence alfo, there can be no fuch thing as abfolute heat, becaufe no degree of velocity can be affigned but a greater is ftill affignable, till we come to infinity, where we are quite loft, as having no idea of infinite velocity or heat.

From this theory of heat and cold we may conclude, that there is no body in nature whofe parts are not in motion, in fome degree, fince we have yet been able to difcover no ultimate degree or limit of cold; and if any fuch thing were to be found in nature, it is likely that it would be as impoffible to bear or endure the teft, as any extreme degree of heat; both heat and cold naturally tending to deftroy the animated part, or teft, in the extreme degrees: cold, by deftroying the vital motion, and fixing the part rigid and inflexible; but heat, by putting the parts into too great an agitation, caufing a greater velocity of the fluids, and diffipation and a force of tenfion in the folids beyond what the natural ftate of the body can bear; and therefore it will inevitably deftroy it.

Heat, in the animal œconomy, known by the feveral names of natural heat, vital heat, innate heat, and animal heat, is commonly fuppofed to be that generated by the attrition of the parts of the blood, occafioned by its circulatory motion, efpecially in the arteries.

To what organs, or operations, the heat of the human body, and other animal bodies, is owing, is hitherto extremely doubtful. The opinions that at prefent prevail are, 1. That the heat of animal-bodies is owing to the attrition betwixt the arteries and the blood. 2. That the lungs are the fountain of this heat. 3. That the attrition of the parts of the folids on one another produce it. 4. That it is owing to the mechanical attrition of the particles of our fluids. To which opinions Dr Stevenfon of Edinburgh added a 5th, *viz.* That whole procefs by which our aliment and juices are conftantly undergoing fome alteration.

The reafonings in favour of thefe feveral opinions may be feen at large, as laid down by the above-mentioned author in an effay on the caufe of animal-heat, in the Medical Effays, vol. vi. The chief arguments in favour of the firft opinion, are, that if an artery is tied, or cut, the part to which it goes turns cold; and on the ceafing of the pulfation of the arteries, cold and death follow. An increafe of heat attends a brifk circulation, and a languid circulation is accompanied with a fmall heat. One who burns in a fever, or is hot with exercife, has a full and frequent pulfe. In cold faintings, chlorofis, *&c.* the pulfe is fmall and flow. To thefe they add, that the thermometer fhews the arterial blood to be a little hotter than that of the veins.

This is accounted for from the conical figure of the arteries, from their fluxes and branches into exquifitely fmall capillaries; whence the refiftance, and confequently the attrition, muft be great, from the number, ftrength, and elafticity of their coats, from the propelling power of the heart, and their ftrong refiftance. From all thefe it is inferred, that the particles of blood perpetually getting new motions, directions, and rotations, are attenuated, condenfed, have their angles grinded off, and are made homogeneous: hence, it is faid, follows the fluidity, red colour, and heat of the mafs, which is here perfected.

The fecond opinion is, that the lungs are the fountain of heat in the human body. All that has been faid for the blood's being heated in the arteries is advanced to prove this hypothefis, with confiderable additions, *viz.* that in the lungs the blood-veffels every where attend, divide, and fubdivide, along with the ramifications of the wind-pipe; and as thefe are perpetually changing their fituation and form, becoming longer or fhorter, making more acute or more obtufe angles,

angles, fo muft the concomitant blood-veffels every moment make new angles, and give the blood new directions; that at laft it enters into an exquifitely fine net-work, fpreads every where on the vaftly thin air-veficles, where thefe air-bladders are perpetually changing their angles, points of contact, their form, volume, interftices, and fo forth. From thefe and the elafticity of the air, and weight of the atmofphere, the blood is faid to be churned, preffed backward and forward, broken and kneaded together, diffolved and condenfed, made red and hot in refpiration.

The third opinion is, that the caufe of the animal heat is owing to the action of the folid parts upon one another. The reafon in fupport of this opinion, is, that the heart and arteries move moft; thence that it is natural to think, that the heat fhould be owing to this motion.

The fourth opinion is, the mechanical attrition of the particles of the fluids upon one another. Dr Stevenfon obferves, that thofe who fupport this hypothefis, muft not only fuppofe that mechanical attrition begets heat, but begets itfelf without diminution; that they muft not only fhew what fets this attrition agoing, but what maintains it, becaufe all mechanical force perpetually decreafes in a refifting medium; in fhort, that they muft fhew the poffibility of a perpetuum mobile, the impoffibility of which they themfelves demonftrate.

The fifth opinion is, what Dr Stevenfon calls the animal procefs, or that procefs by which our aliment and fluids are perpetually undergoing fome alteration. This procefs, according to that writer, may be one *fui generis*, fomewhat of a middle nature betwixt fermentation and putrefaction; and he thinks it comes fo near to the latter, that he chufes to call it by that name. In putrefaction, which is a moft powerful diffolvent of bodies, the inteftine action of their minute particles creates, collects, or fome way or other is the caufe or means of heat. The doctor thinks it probable that this procefs is conftantly carried on in all our juices, efpecially where there is blood; and this is chiefly in the veins, fo that the blood is both the fountain of heat and the firft fpring and motion.

The late Dr Mortimer, in the Philof. Tranf. n° 476. gives it as his opinion, that the heat of animals is explicable from the phofphorus and air they contain. Phofphorus exifts, at leaft in a dormant ftate, in animal fluids; and it is alfo known, that they all contain air: it is therefore only neceffary to bring the phofphoreal and aerial particles into contact, and heat muft of confequence be generated.

HEATH, in botany. See ERICA,

Berry-bearing HEATH. See EMPETRUM.

HEATHENS, in matters of religion. See PAGANS.

HEAVEN, literally fignifies the expanfe of the firmament, furrounding our earth, and extended every way to an immenfe diftance.

The Hebrews acknowledged three heavens: the firft the aerial heaven, in which the birds fly, the winds blow, and the fhowers are formed; the fecond, the firmament in which the ftars are placed; the third, the heaven of heavens, the refidence of the Almighty, and the abode of faints and angels.

Heaven is confidered by Chriftian divines and philophers, as a place in fome remote part of infinite fpace, in which the omniprefent Deity is faid to afford a nearer and more immediate view of himfelf, and a more fenfible manifeftation of his glory, than in the other parts of the univerfe. This is often called the empyrean, from that fplendor with which it is fuppofed to be invefted; and of this place the infpired writers give us the moft noble and magnificent defcriptions.

The pagans confidered heaven as the refidence only of the celeftial gods, into which no mortals were admitted after death, unlefs they were deified. As for the fouls of good men, they were configned to the elyfian fields. See ELYSIAN FIELDS.

HEBDOMARY, a folemnity of the ancient Greeks, in honour of Apollo, in which the Athenians fung hymns in honour of that god, and carried in their hands branches of laurel. The word fignifies the feventh day, this folemnity being obferved on the feventh day of every lunar month.

HEBENSTRETIA, in botany, a genus of the didynamia angiofpermia clafs. The calix is bilabiated; the corolla has but one labium, confifting of four fegments; and the capfule contains two feeds. There are two fpecies, both natives of Ethiopia.

HEBRAISM, an idiom or manner of fpeaking peculiar to the Hebrew language. See the next article.

HEBREW, or HEBREW LANGUAGE, that fpoken by the ancient Jews, and wherein the Old Teftament is wrote.

This appears to be the moft ancient of all the languages in the world, at leaft we know of none older: and fome learned men are of opinion, that this is the language in which God fpoke to Adam in Paradife.

The books of the Old Teftament are the only pieces to be found, in all antiquity, written in pure Hebrew; and the language of many of thefe is extremely fublime; it appears perfectly regular, and particularly fo in its conjugations; indeed, properly fpeaking, it has but one conjugation, but this is varied in each feven or eight different ways, which has the effect of fo many different conjugations, and affords a great variety of expreffions to reprefent by a fingle word the different modifications of a verb, and many ideas which in the modern and in many of the ancient and learned languages cannot be expreffed without a periphrafis.

The primitive words, which are called roots, have feldom more than three letters or two fyllables.

In this language there are twenty-two letters, only five of which are ufually reckoned vowels, which are the fame with ours, *viz. a, e, i, o, u;* but then each vowel is divided into two, a long and a fhort, the found of the former being fomewhat grave and long, and that of the latter fhort and acute: it muft however be remarked, that the two laft vowels have founds that differ in other refpects befides quantity, and a greater or lefs elevation. To thefe ten or twelve vowels may be added others called femi-vowels, which ferve to connect the confonants, and to make the eafier tranfitions from

from one another. The number of accents to this language are, indeed, prodigious: of theſe there are near forty, the uſe of ſome of which, notwithſtanding all the inquiries of the learned, are not yet perfectly known. We know, in general, that they ſerve to diſtinguiſh the ſentences like the points called commas, ſemicolons, *&c.* in our language; to determine the quantity of the ſyllables, and to mark the tone with which they are to be ſpoken or ſung. It is no wonder then, that there are more accents in the Hebrew than in other languages, ſince they perform the office of three different things, which in other languages are called by different names.

HEBREWS, or *Epiſtle to the* HEBREWS, a canonical book of the New Teſtament.

Though St Paul did not prefix his name to this epiſtle, the concurrent teſtimony of the beſt authors ancient and modern afford ſuch evidence of his being the author of it, that the objections to the contrary are of little or no weight.

The Hebrews, to whom this epiſtle was wrote, were the believing Jews of Paleſtine; and its deſign was to convince them, and by their means all the Jewiſh converts whereſoever diſperſed, of the inſufficiency and aboliſhment of the ceremonial and ritual law.

HEBRIDES, iſlands on the weſt of Scotland, of which Sky, Mull, Iſla, and Arran are ſome of the largeſt.

HECATOMB, among the ancient pagans, was the ſacrifice of an hundred bulls or oxen; or, in a leſs confined ſenſe, an hundred animals of any ſort.

HECATOMBÆON, in ancient chronology, the firſt month of the Athenian year, conſiſting of thirty days, and anſwering to the latter part of our June.

HECK, an engine to take fiſh. A ſalmon heck is a grate for catching that ſort of fiſh.

HECTIC FEVER. See MEDICINE.

HEDERA, in botany, a genus of the pentandria monogynia claſs. The corolla conſiſts of five oblong petals, and the berry contains five ſeeds. There are two ſpecies; one of them, *viz.* the helix, is a native of Britain.

HEDERA TERRESTRIS. See GLECHOMA.

HEDGES, in agriculture, are either planted to make fences round incloſures, or to divide the ſeveral parts of a garden. When they are deſigned as outward fences, they are planted either with haw thorn, crabs, or blackthorn; but thoſe hedges which are planted in gardens, either to ſurround wilderneſs-quarters, or to ſcreen the other parts of a garden from ſight, are planted according to the fancy of the owner, ſome preferring ever-greens, in which caſe the holly is beſt; next the yew, then the laurel, lauruſtinus, phillyria, *&c.* others prefer the beech, the hornbeam, and the elm.

HEDMORA, a city of Sweden, in the province of Weſtmania, ſituated on the river Dalecarlia, fifty miles north-weſt of Upſal: E. long. 15° 55′, and N. lat. 60° 16′.

HEDYOTIS, in botany, a genus of the tetrandria monogynia claſs. The calix conſiſts of one funnel ſhaped petal; and the capſule has two cells, and many ſeeds. There are three ſpecies, all natives of Ceylon.

HEDYSARUM, in botany, a genus of the diadelphia decandria claſs. The corolla is tranſverſely carinated; and the pod is jointed, each joint containing one ſeed. There are 46 ſpecies, only one of which is a native of Britain, *viz.* the St Foin, or cocks-head.

HEEL, in anatomy. See ANATOMY, p. 185.

HEEL, in the ſea language. If a ſhip leans on one ſide, whether ſhe be a-ground or a-float, then it is ſaid ſhe heels a ſtarboard, or a-port; or that ſhe heels offwards, or to the ſhore; that is, inclines more to one ſide than to another.

HEELER, or *Bloody* HEEL-*cock*, a fighting cock that ſtrikes or wounds much with his ſpurs.

The maſters know ſuch a cock, even while a chicken, by the ſtriking of his two heels together in his going.

HEGIRA, in chronology, a celebrated epocha among the Mahometans.

The event which gave riſe to this epocha was the flight of Mahomet from Mecca, with his new proſelytes, to avoid the perſecution of the Coraiſchites; who, being then moſt powerful in the city, could not bear that Mahomet ſhould aboliſh idolatry, and eſtabliſh his new religion. This flight happened in the fourteenth year after Mahomet had commenced prophet: he retired to Medina, which he made the place of his reſidence.

HEIDELBURG, a city of Germany, in the circle of the lower Rhine, the capital of the Palatinate, ſituated on the river Neckar: E. long. 8° 40′, and N. lat. 49° 20′.

HEILA, a port-town of regal Pruſſia, in the kingdom of Poland, ſituated on the point of a peninſula in the Baltic ſea, twelve miles north of Dantzick: E. long. 19°, N. lat. 54° 30′.

HEINUSE, among hunters, a roe-buck of the fourth year.

HEIR, in Scots law, a generic term applicable to thoſe who are intitled by law to take the poſſeſſion of any ſubject which belonged to a perſon deceaſed.—For the different kinds of heirs, *&c.* ſee LAW, tit. 27. & 28.

HEIRSHIP *moveables*, in Scots law, the beſt of certain kinds of moveables, which the heir of line is intitled to take, beſides the heretable eſtate. See LAW, tit. 27.

HEIR-APPARENT, is a perſon ſo called in the lifetime of his anceſtor, at whoſe death he is heir at law.

HEIRESS, a female heir to one who has an eſtate in lands, *&c.* Stealing an heireſs, and marrying her againſt her will, was declared felony by 3 Hen. VII.

HELENA, or *St* HELENA, an iſland in the Atlantic ocean, ſituated 1200 miles weſt of the coaſt of Africa, and 1800 eaſt of the coaſt of ſouth America: W. long. 6° 30′, S. lat. 16°.

HELENIUM, in botany, a genus of the ſyngeneſia polygamia ſuperflua claſs. The receptacle is naked; the calix is ſimple, and conſiſts of many leaves; and the corollulæ of the radius are ſemitrifid. There is but one ſpecies, a native of Auſtria.

HELIÆA, in Grecian antiquity, was the greateſt and moſt frequented court in Athens for the trial of civil affairs. The judges who ſat in it were at leaſt fifty, but the more uſual number was either two or five hundred. When cauſes of great moment were to be tried, it was cuſtomary to call in the judges of the other courts: ſometimes a thouſand were called in, and then two courts are ſaid to have been joined; ſometimes fifteen hundred or two thouſand were called in, and then three or four courts met together.

They had cognizance of civil affairs of the greateſt weight and importance, and were not permitted to give judgment till they had taken a ſolemn oath to do it with impartiality, and to give ſentence according to the laws, *&c.*

HELIACAL, in aſtronomy, a term applied to the riſing or ſetting of the ſtars; or, more ſtrictly ſpeaking, to their emerſion out of, and immerſion into, the rays and ſuperior ſplendor of the ſun.

A ſtar is ſaid to riſe heliacally, when after having been in conjunction with the ſun, and on that account inviſible, it comes to be at ſuch a diſtance from him, as to be ſeen in the morning before ſun-riſing; the ſun, by his apparent motion, receding from the ſtar towards the eaſt: on the contrary, the heliacal ſetting is when the ſun approaches ſo near a ſtar, as to hide it with his beams, which prevent the fainter light of the ſtar from being perceived; ſo that the terms apparition and occultation would be more proper than riſing and ſetting.

HELIANTHEMUM, in botany, ſee the article CISTUS.

HELIANTHUS, *the Great* SUN-FLOWER, in botany, a genus of the ſyngeneſia polygamia fruſtranea claſs. The receptacle is paleaceous and plane; the pappus conſiſts of two leaves; and the calix is imbricated and ſquarrous. There are twelve ſpecies, none of them natives of Britain.

HELIASTES, in antiquity, one of the judges of the court heliæa. See HELIÆA.

HELICTERES, the SREW-TREE, in botany, a genus of the gynandria decandria claſs. It has five ſtyli; the calix conſiſts of one oblique leaf; the petals are five; the nectarium conſiſts of five ſmall leaves; and it has five twiſted capſules. There are four ſpecies, none of them natives of Britain.

HELIOCARPUS, in botany, a genus of the dodecandria digynia claſs. The calix conſiſts of four leaves; the petals are four; the ſtyli are ſimple; and the capſule conſiſts of two compreſſed cells, radiated on each ſide. There is but one ſpecies, a native of America.

HELIOCENTRIC *latitude of a planet*, the inclination of a line drawn between the centre of the ſun and the center of a planet, to the plane of the ecliptic.

HELIOCENTRIC *place of a planet*, in aſtronomy, the place of the ecliptic wherein the planet would appear to a ſpectator placed at the centre of the ſun.

HELIOCOMETES, a phænomenon ſometimes obſerved about ſun ſetting; being a large luminous tail, or column of light, proceeding from the body of the ſun, and dragging after it, not unlike the tail of a comet; whence the name.

HELIOSCOPE, in optics, a ſort of teleſcope, peculiarly fitted for viewing the ſun without hurting the eyes.

HELIOSTATA, in optics, an inſtrument invented by the late learned Dr S Graveſande; who gave it this name, from its fixing, as it were, the rays of the ſun in an horizontal direction acroſs the dark chamber all the while it is in uſe.

HELIX, in anatomy. See ANATOMY, p. 298.

HELIX, in zoology, a genus belonging to the order of vermes teſtacea. It is an animal of the ſnail-kind; the ſhell conſiſts of one ſpiral, brittle, and almoſt diaphanous valve; and the aperture is narrow. There are 60 ſpecies, principally diſtinguiſhed by the figure of their ſhells.

HELL, the place of divine puniſhment after death.

As all religions have ſuppoſed a future ſtate of exiſtence after this life; ſo all have their hell or place of torment, in which the wicked are ſuppoſed to be puniſhed. The hell of the ancient heathens was divided into two manſions; the one called elyſium, on the right hand, pleaſant and delightful, appointed for the ſouls of good men; the other called tartara, on the left, a region of miſery and torment, appointed for the wicked. The latter only was hell, in the preſent reſtrained ſenſe of the word. See ELYSIUM.

The philoſophers were of opinion, that the infernal regions were at an equal diſtance from all the parts of the earth; nevertheleſs it was the opinion of ſome, that there were certain paſſages which led thither, as the river Lethe near the Syrtes, and the Acheruſian cave in Epirus. At Hermione it was thought, that there was a very ſhort way to hell; for which reaſon the people of that country never put the fare into the mouths of the dead to pay their paſſage.

The Jews placed hell in the centre of the earth, and believed it to be ſituated under waters and mountains. According to them, there are three paſſages leading to it: the firſt is in the wilderneſs, and by that Korah, Dathan and Abiram deſcended into hell; the ſecond is in the ſea, becauſe Jonah, who was thrown into the ſea, cried to God out of the belly of hell; the third is in Jeruſalem, becauſe it is ſaid the fire of the Lord is in Zion, and his furnace is in Jeruſalem. They likewiſe acknowledged ſeven degrees of pain in hell, becauſe they find this place called by ſeven different names in ſcripture. Though they believed that infidels, and perſons eminently wicked, will continue for ever in hell; yet they maintained, that every Jew who is not infected with ſome hereſy, and has not acted contrary to the points mentioned by the rabbins, will not be puniſhed therein for any other crimes above a year at moſt.

The Mahometans believe the eternity of rewards and puniſhments in another life. In the Koran it is ſaid, that hell has ſeven gates, the firſt for the Muſſulmans, the ſecond for the Chriſtians, the third for the Jews, the fourth for the Sabians, the fifth for the Magians, the

the fixth for the pagans, and the feventh for the hypocrites of all religions.

Among Chriftians, there are two controverted queftions in regard to hell; the one concerns locality, the other the duration of its torments. The locality of hell, and the reality of its fire, began firft to be controverted by Origen. That father, interpreting the fcripture account metaphorically, makes hell to confift not in external punifhments, but in a confcioufnefs or fenfe of guilt, and a remembrance of paft pleafures. Among the moderns, Mr Whifton advanced a new hypothefis. According to him, the comets are fo many hells appointed in their orbits alternately to carry the damned into the confines of the fun, there to be fcorched by its violent heat, and then to return with them beyond the orb of Saturn, there to ftarve them in thefe cold and difmal regions. Another modern author, not fatisfied with any hypothefis hitherto advanced, affigns the fun to be the local hell. As to the fecond queftion, *viz.* the duration of hell-torments, we have Origen again at the head of thofe who deny that they are eternal; it being that father's opinion, that not only men, but devils, after a due courfe of punifhment fuitable to their refpective crimes, fhall be pardoned and reftored to heaven. The chief principle upon which Origen built his opinion, was the nature of punifhment, which he took to be emendatory, applied only as phyfic for the recovery of the patient's health. The chief objection to the eternity of hell torments among modern writers, is the difproportion between temporary crimes and eternal punifhments. Thofe who maintain the affirmative, ground their opinions on fcripture accounts, which reprefent the pains of hell under the figure of a worm which never dies, and a fire which is not quenched; as alfo upon the words, "Thefe fhall go away into everlafting punifhment, but "the righteous into life eternal.

HELLEBORUS, HELLEBORE, in botany, a genus of the polyandria polygynia clafs. It has no calix; the petals are five or more; the nectarium is tubular and bilabiated; and the capfule contains many feeds. There are five fpecies, two of them natives of Britain, *viz.* the fætidus, or great baftard black hellebore; and the viridis, or wild black hellebore. The hellebore, when taken in large quantities, is poifonous; but the root, in fmall dofes, is fuppofed to attenuate the humours, and to promote urinary and uterine difcharges.

HELLENISM, in matters of language, a phrafe in the idiom, genius, or conftruction of the Greek tongue.

This word is only ufed when fpeaking of the authors who, writing in a different language, exprefs themfelves in a phrafeology peculiar to the Greek.

HELLENISTIC, or HELENISTIC LANGUAGE, that ufed by the Grecian Jews who lived in Egypt and other parts where the Greek tongue prevailed. In this language it is faid the Septuagint was written, and alfo the books of the New Teftament; and that it was thus denominated to fhew that it was Greek filled with Hebraifms and Syriacifms.

HELLESPONT, the entrance of the ftreights which divides Afia from Europe, and paffes from the Archipelago to Conftantinople. It is now called the Dardanelles, and is about two miles wide.

HELM *of a fhip*, is a piece of timber faftened into the rudder, which comes forward into the fteerage, or place where the perfon at the helm fteers the fhip, by holding the whipftaff in his hand, which is joined to the helm. They begin however to be left off, fteering-wheels being ufed in their room.

There are feveral terms in the fea-language relating to the helm; as, *bear up the helm*: that is, let the fhip go more large before the wind. *Helm a mid-fhip*, or *right the helm*; that is, keep it even with the middle of the fhip. *Port the helm*, put it over the the left fide of the fhip. *Starboard the helm*, put it on the right fide of the fhip.

HELMET, an ancient defenfive armour worn by horfemen both in war and in tournaments. It covered both the head and face, only leaving an aperture in the front fecured by bars, which was called the vifor.

HELMINTHOLITHUS, in natural hiftory, a name given by Linnæus to petrified bodies refembling worms.

Of thefe he reckons four genera. 1. Petrified lithophyta, found in the mountains of Sweden. 2. Petrified fhells. 3. Petrified zoophytes. 4. Petrified reptiles.

HELMONT, a town of the Netherlands, in the province of Dutch Brabant, fituated on the river Aa: E. long. 5° 40′, N. lat. 51° 30′.

HELMSTAT, a town of Germany, in the circle of Lower Saxony, and dukedom of Brunfwic: E. long. 11° 15′, N. lat. 52° 20′.

HELOTS, in Grecian antiquity, the inhabitants of Helos, a town of Laconia, conquered by the Spartans; who made them all prifoners of war, and reduced them into the condition of flaves.

The freemen of Sparta were forbidden the exercife of any mean or mechanical employment, and therefore the whole care of fupplying the city with neceffaries devolved upon the Helots.

HELSINGFORD a port-town of Sweden, fituated on the gulph of Finland, in 24° 6′ E. long. and 60° 8′ N. lat.

HELSINGIA, a province of Sweden, bounded by the Bothnic gulph on the eaft, and by Dalecarlia on the weft.

HELSINGIC CHARACTER, a peculiar kind of character, found infcribed on ftones in the province of Helfingia: the Runic and Helfingic characters may be eafily tranformed into each other.

HELSTON, a borough of Cornwall, nine miles fouthweft of Falmouth: it fends two members to parliament.

HELVOETSLUYS, a port-town of the united Netherlands, fituated in the ifland of Voorn, in the province of Holland, five miles fouth of the Briel: it is one of the beft harbours in Holland, and that to which the Englifh packet alway goes.

HEMEROBIUS, in zoology, a genus of infects of the neuroptera order, the characters of which are thefe: The mouth is furnifhed with two teeth; the palpi are four; the wings are deflected, but not plaited; and the

the antennæ are briſtly and longer than the breaſt. There are 15 ſpecies, principally diſtinguiſhed by their colours.

HEMEROCALLIS, DAY-LILLY, in botany, a genus of the hexandria-monogynia claſs. The corolla is bell-ſhaped, with a cylindrical tube; and the ſtamina are declinated. There are two ſpecies, none of them natives of Britain.

HEMI, a word uſed in the compoſition of divers terms, ſignifying the ſame with ſemi, or demi, *viz.* one half.

HEMINA, in Roman antiquity, a liquid meaſure which, according to Arbuthnot, was equal to half a wine-pint engliſh meaſure; its contents being 2,818 ſolid inches.

HEMIONITIS, in botany, a genus of the cryptogamia filices claſs. The parts of fructification lie in decuſſating lines. There are three ſpecies, none of them natives of Britain.

HEMIPLEGIA, or HEMIPLEXIA, among phyſicians, a palſy of one half of the body.

HEMISPHERE, in geometry, the half of a globe or ſphere, when it is ſuppoſed to be cut through its centre in the plane of one of its great circles.

HEMISPHERE is alſo uſed to denote a projection of half the terreſtrial globe, or half the celeſtial ſphere, on a plane, and frequently called planiſphere.

HEMISTICH, in poetry, denotes half a verſe, or a verſe not completed.

HEMITRITÆUS, among phyſicians, a kind of intermitting fever, being a ſemitertian. See MEDICINE.

HEMLOCK, in botany. See CICUTA.

HEMP, in botany. See CANNABIS.

The raiſing and dreſſing of hemp ſcarcely differs from the raiſing and dreſſing of flax, but in the following particulars.

Hemp requires a light, free, dry, duſty, and even a ſandy warm ſoil; which if not naturally rich, muſt be made ſo by manure. New broke up ground does not anſwer for hemp, producing it thin and poor upon the ſtalk. Hemp does well to follow beans. The ground ſhould be ploughed and harrowed three or four times, a fortnight or three weeks intervening between each time. In ſome parts of Lincoln and Holland the ſoil is naturally ſo free and rich, that it will produce hemp conſtantly year after year without manure. The leaves which fall off the ſtalk help to manure the ground. It is frequently ſown with a view to clear the ground of weeds; which it does moſt affectually, growing faſt, and ſoon checking every weed but mugwort, which is picked out with a fork.

It is ſown about the firſt of May; ſo thin, that about four pecks are ſufficient for an Engliſh acre; and the ground muſt then be covered as much as poſſible to preſerve the ſeed from the birds, who are very fond of it.

The *taper-topped* ſtalk which does not bear the pods, is called the *female*, though in fact it is the *male*, ſcattering from its bloom a ſmall duſt, which impregnates the pods of the *buſhy-topped*; which laſt is commonly, though improperly, called the male or carle hemp.

When hemp is the object of the farmer more than a crop of ſeed, the whole ſhould be pulled when the ſtalk begins to grow yellow, and the earth remaining about the roots ſhould be beat off to prevent more growth: but if the ſeed is wanted in its greateſt perfection, the ſtalks bearing the pods muſt be pulled before the upmoſt pod begins to open; the earth ſhould not be beat off from the roots; it ſhould be ſtooked in ſheaves upon the field, to dry and win as corn; and the top of theſe ſtooks ſhould be covered with undergrowth, or the like, to preſerve the ſeed from the birds.

Hemp is ſooner watered than flax, and the canals muſt be deeper.

In keeping the ſeed, care muſt be taken to preſerve it from rats, mice, and ſuch like vermin, who are all fond of it.

It is dreſſed as coarſe flax, but is ſooner dreſſed; and its greater length requires more care, and renders it more troubleſome in the handling, eſpecially in the ſkutching of it by the water lint-mills with horizontal ſkutchers, when it muſt be folded double. What is too coarſe and ſtrong in the ſtalk for the hand or foot machines, may be broke and peeled by the hand. See FLAX.

HEMPSTEAD, a market-town of Hartfordſhire, twenty-four miles north-weſt of London.

HEN, in ornithology. See PHASIANUS.

HEN-BANE. See HYOSCIAMUS.

HENDECAGON, in geometry, a figure that hath eleven ſides and as many angles.

HENLEY, a market-town of Oxfordſhire, ſituated on the river Thames, twenty miles ſouth-eaſt of Oxford, and thirty-two weſt of London.

HENNEBURG, a town of Germany, in the circle of Franconia, and the capital of the county of Henneburgh: E. long 10° 27′, and N. lat. 50° 40′.

HENOTICON, in church-hiſtory, a decree or edict of the emperor Zeno, made at Conſtantinople, in the year 482, by which he pretended to reconcile all parties under one faith. It is generally agreed that Peter, patriarch of Alexandria, and Acacius, patriarch of Conſtantinople, were the authors of this decree, and that their deſign was to compliment the emperor with a right of preſcribing regulations in matters of faith. The emperor, by this decree, arrogated to himſelf the right of being head of the church. Pope Simplicius, however, in the year 483, condemned the henoticon, and cited Acacius, the chief promoter of it, to appear before him at Rome; but it was not entirely ſuppreſſed till the year 518.

HENRICO, a county of the colony of Virginia, in North America.

HENRY, or CAPE-HENRY, the ſouth cape of Virginia, at the entrance of Cheſepeak-bay: W. long. 74° 50′, N. lat. 37°.

HEPAR SULPHURIS, or LIVER OF SULPHUR. See CHEMISTRY.

HEPATIC, in medicine and anatomy, any thing belonging to the liver.

HEPATICA, in botany. See ANEMONE.

HEPATITIS, in medicine. See MEDICINE.

HEPATUS, in ichthyology. See LABRUS.

HEPHÆSTIA, in Grecian antiquity, an Athenian feſtival, in honour of Vulcan, the chief ceremony of which was a race with torches.

HEPSETUS, in ichthyology. See ESOX.

HEPTACHORD, in the ancient poetry, ſignified verſes that were ſung or played on ſeven chords, that is, on ſeven different notes. In this ſenſe it was applied to the lyre, when it had but ſeven ſtrings.

HEPTAGON, in geometry, a figure conſiſting of ſeven ſides and as many angles.

HEPTANDRIA, in botany. See BOTANY, p. 635.

HEPTANGULAR, in geometry, an appellation given to figures which have ſeven angles.

HEPTARCHY, a government of ſeven perſons: alſo a a ſtate or country divided into ſeven kingdoms, and governed by ſeven independent princes; in which ſenſe it is particularly applied to the government of ſouth Britains when divided amongſt the Saxons.

HEPTATEUCH, the ſeven firſt books of the Old Teſtament, containing the pentateuch, or five books of Moſes, and the books of Joſhua and Judges.

HEPHTHEMIMERIS, in ancient poetry, a verſe conſiſting of three feet and an half, or ſeven half feet.

It likewiſe denotes a cæſura after the third foot of a verſe.

HERACLEA, a port-town of Romania, in European Turky, ſituated on the Propontis, ſixty miles ſouthweſt of Conſtantinople; it was once a great city: E. long. 28°, and N. lat. 41°.

HERACLEONITES, a ſect of chriſtians, the followers of Heracleon, who refined upon the gnoſtic divinity, and maintained that the world was not the immediate production of the Son of God, but that he was only the occaſional cauſe of its being created by the demiurgus. The Heracleonites denied the authority of the prophecies of the Old Teſtament, maintaining that they were mere random ſounds in the air; and that St. John the Baptiſt was the only true voice that directed to the Meſſiah.

HERACLEUM, in botany, a genus of the pentandria digynia claſs, the general flower of which is difform and radiated; the ſingle flowers of the diſc conſiſt each of five equal petals, but thoſe of the radius conſiſt of five unequal petals: the fruit is eliptic, compreſſed, and ſtriated on each ſide in the middle, and contains two oval compreſſed ſeeds. There are five ſpecies, one of which, *viz.* the ſphondylium, or cow-parſnip, is a native of Britain.

HERACLIDÆ, or *Return of the* HERACLIDÆ *into Peloponneſus*, in chronology, a famous epocha, that conſtitutes the beginning of profane hiſtory; all the time preceding that period being accounted fabulous.

This return happened in the year of the world 2862, an hundred years after they were expelled, and eighty after the deſtruction of Troy.

HERALD, an officer at arms, whoſe buſineſs it is to declare war, to proclaim peace, to marſhal all the ſolemnities at the coronation, chriſtening, marriage, and funeral of princes, to blazon and examine coats of arms, *&c.*

Heralds were formerly held in much greater eſteem than they are at preſent, and were created and chriſtened by the king, who pouring a gold-cup of wine on their head, gave them the herald-name; but this is now done by the earl-marſhal. They could not arrive at the dignity of herald without having been ſeven years purſuivant; nor could they quit the office of herald, but to be made king at arms.

HERALDRY, is the art of armory and blazoning; or, the knowledge of what relates to the bearing of arms, and the laws and regulations thereof.

Arms, or *Armories*, are marks of dignity and honour, regularly compoſed of certain figures and colours, given or authorized by ſovereigns, and borne in banners, ſhields, coats, *&c.* for the diſtinction of perſons, families, and ſtates, and paſſing by deſcent to poſterity.

They are called *arms*, in regard they are borne principally on the buckler, cuiraſſe, banners, and other apparatus of war; and *coats of arms*, *coat-armour*, &c. becauſe anciently embroidered on a cloak or habit, worn by the ancient knights over their arms, both in war and at tournaments, and ſtill borne by the heralds at arms.

It was a kind of ſurcoat, reaching only as low as the navel, open at the ſides, with ſhort ſleeves; ſometimes furred with *ermine* and *vair*, wherein were applied the *armories* of the knight, embroidered with gold and ſilver, and enamelled with beaten tin, coloured *black*, *green*, *red*, and *blue*; whence the rule never to apply colour on colour, nor metal on metal.

The *coats of arms* were frequently open, and diverſified with bands and fillets of ſeveral colours, alternately placed, as we ſtill ſee cloths ſcarleted, watered, *&c.* Hence they were alſo called *devices* or *diviſes*; and being divided, or compoſed of ſeveral pieces ſewed together, whence the words *feſſe*, *pale*, *chevron*, *bend*, *croſs*, *ſalter*, *lozenge*, &c. See theſe articles.

The ſurcoat being embroidered with *gold* and *ſilver*, was the occaſion that thoſe two metals have been ſince placed in the coats of arms, under their *French* name of *or* and *argent*; and their being coloured *black*, *green*, *red*, and *blue*, that thoſe different colours have alſo been introduced in them: therefore,

There are two metals in *Heraldry*, viz, *or* and *argent*; and ſeven colours, which are, *gules*, *azure*, *ſable*, *vert*, *purpure*, *tenne*, and *ſanguine*. See theſe and all the other terms belonging to heraldry as they occur in the order of the alphabet.

HERAT, a city of Perſia, in the province of Choraſſan: E. long. 61°, and N. lat. 34° 30′.

HERB, in pharmacy, an appellation given to the ſtalks and leaves of plants, eſpecially ſuch as are fleſhy and ſucculent, and die away every year; but is alſo frequently uſed to denote the leaves alone.

HERBAL, a book that treats of the claſſes, genera, ſpecies, and virtues of plants. See BOTANY.

HERBIVOROUS ANIMALS, thoſe which feed only on vegetables.

HERBOURG, a town in the circle of the upper Rhine, and territory of Naſſau: E. lon. 8° 15′, and N. lat. 50° 36′.

HERCINIAN,

HERCINIAN FOREST, a foreſt which anciently extended the whole length of Germany and Bohemia, ſome remains of which are ſtill in being, *viz.* the Black Foreſt, Odenwald near Heidelburg, Stigewald in Wurtſburg, and Bamberg, and Hartſwald in Brunſwic.

HERCOLE, a port-town of Tuſcany, on the coaſt called Stato del Preſidii: E. lon. 12°, and N. lat. 42° 25′.

HERCULES, in aſtronomy. See ASTRONOMY. p. 486.

HERCULES-PILLARS, in antiquity, a name given to mount Calpe in Spain, near Gibraltar, on the European ſide of the ſtreights, and mount Avila on the African ſide.

HEREDITAMENTS, whatever immoveable things a perſon may have to himſelf and his heirs by way of inheritance; and which, if not otherwiſe bequeathed, deſcend to him who is next heir, and not to the executor, as chattels do.

HEREDITARY, an appellation given to whatever belongs to a family by right of ſucceſſion, from heir to heir.

HEREDITAS JACENS, in Scots law. An eſtate is ſaid to be *in hereditate jacente*, after the proprietor's death, till the heir's entry.

HEREFORD, the principal city of Herefordſhire, ſituated on the river Wye, twenty-four miles north-weſt of Gloceſter, and one hundred and twenty weſt of London: W. lon. 2° 42′, and N. lat. 52° 6′.

It ſends two members to parliament.

HERESY, the crime of obſtinately perſiſting in opinions that are contrary to the fundamentals of religion.

HERETABLE RIGHTS, in Scots law, all rights affecting lands, houſes, *&c.* or any immoveable ſubject. See LAW, tit. 9.

HERETAGE, in Scots law, lands, houſes, or any immoveable ſubject, in contradiſtinction to moveables or moveable ſubjects. See LAW, tit. 9. It alſo ſometimes ſignifies ſuch immoveable property as a perſon ſucceeds to as heir to another, in contradiſtinction to that which he himſelf purchaſes or acquires in any other manner, called *conqueſt*. See LAW, tit. 27.

HERETIC, a general name for all ſuch perſons, under any religion, but eſpecially the Chriſtian, as profeſs or teach religious opinions contrary to the eſtabliſhed faith, or to what is made the ſtandard of orthodoxy.

HERLING, a market-town of Norfolk, twenty miles ſouth-weſt of Norwich.

HERMÆ, among antiquarians, ſtatues of the god Mercury, made of marble, and ſometimes of braſs, without arms or feet, and ſet up by the Greeks and Romans in the croſs ways.

HERMÆA, in antiquity, ancient Greek feſtivals, in honour of the god Hermes or Mercury.

HERMANIA, in botany, a genus of the monadelphia pentandria claſs. It has but one ſtylus; the capſule has five cells; and the petals are ſemitubular at the baſe. There are nine ſpecies, none of them natives of Britain.

HERMANASTAT, the capital city of Tranſilvania, ſubject to the houſe of Auſtria: E. lon. 24°, N. lat. 46° 32′.

HERMAPHRODITE, a perſon of both ſexes, or who has the parts of generation both of male and female.

It is now generally allowed, that there is no ſuch thing as a true hermaphrodite; moſt, if not all thoſe who paſs for ſuch, being mere women, whoſe clitoris is grown to an enormous ſize, and the labia pudendi become unuſually tumid.

Among the inſect-claſs of animals, indeed, hermaphrodites are very frequent: ſuch as worms, ſnails, leeches, *&c.*

HERMAPHRODITE FLOWERS, among botaniſts. See BOTANY.

HERMATHENA, among antiquarians, a ſtatue repreſenting Mercury and Minerva both in one.

HERMES. See HERMÆ.

HERMETIC, or HERMETICAL, an appellation given to whatever belongs to chemiſtry, from Hermes Triſmegiſtus, who is ſuppoſed to have been its inventor.

HERMETICAL PHILOSOPHY, that which undertakes to ſolve the various phænomena of nature, from the chemical principles ſalt, ſulphur, and mercury.

HERMETICAL SEAL, among chemiſts, a method of ſtopping glaſs-veſſels, uſed in chemichal operations, ſo cloſely, that the moſt ſubtil ſpirit cannot eſcape through them.

It is commonly done by heating the neck of the veſſel in a flame, till ready to melt, and then twiſting it cloſely together with a pair of pincers. Or, veſſels may be hermetically ſealed, by ſtopping them with a glaſs plug, well luted; or, by covering the veſſel with another ovum philoſophicum.

HERMIT, a devout perſon retired into ſolitude to be more at leiſure for contemplation, and to diſencumber himſelf from the affairs of the world.

HERMON, a mountain on the eaſt of Syria and Paleſtine, in Aſia.

HERNANDIA, in botany, a genus of the monœcia triandria claſs. The calix of the male has three ſegments, and the corolla three petals. The calix of the female is entire and truncated; the corolla conſiſts of ſix petals; and the drupa is hollow, with an open mouth, and a looſe kernel. There are two ſpecies, both natives of the Indies.

HERNGRUNT, a town of Upper Hungary, ſituated north of Buda, near the Carpathian mountains: E. lon. 19° 20′ lat. 48° 47′.

HERNIA, in medicine. See MEDICINE and SURGERY.

HERNIARIA, RUPTURE-WORT, in botany, a genus of the pentandria digynia claſs. The calix conſiſts of five ſegments; it has no corolla; and the capſule contains one ſeed. There are four ſpecies, three of them natives of Britain, *viz.* the glabra, or ſmooth rupture-wort; the hirſuta, or rough rupture-wort; and the lenticulata, or ſea rupture-wort. The leaves may be uſed as a mild reſtringent; but have no title to their former reputation of curing ruptures.

HERO, in the ancient mythology, a great and illuſtrious perſon, of a mortal nature, though ſuppoſed by the populace

lace to partake of immortality; and, after his death, placed among the number of the gods.

HEROIC POEM, that which defcribes fome extraordinary enterprize; being the fame with epic poem. See COMPOSITION.

HEROIC VERSE, that wherein heroic poems are ufually compofed; or it is that proper for fuch poems. In the Greek and Latin, hexameter verfes are ufually denominated heroic verfes, as being alone ufed by Homer, Virgil, *&c*.

HERON. in ornithology. See ARDEA.

HERPES, in medicine, a bilious puftule, which breaking out in different manners upon the fkin, accordingly receives different denominations. See MEDICINE.

HERRING, in ichthyology. See CLUPEA.

HERSILLON, in the art of war, is a ftrong plank or beam, about ten or twelve feet long, ftuck full of fpikes on both fides, and ufed to incommode the march of the infantry or cavalry.

HESPER, an appellation given to the planet Venus, when fhe fets after the fun.

HESPERIDES, in antiquity, the daughters of Hefperus, brother of Atlas, who kept a garden full of golden apples, guarded by a dragon: but Hercules having laid the dragon afleep, ftole away the apples.

HESPERIS, DAME'S VIOLET, in botany, a genus of the tetradynamia filiquofa clafs. The petals are obliquely bent; there is a gland betwixt the fhort ftamina; and the ftigma is forked at the bafe, and connivent at top. There are feven fpecies, only one of which, *viz.* the martronalis, or unfavoury dame's violet, is a native of Britain.

HESSE-CASSEL landgraviate, including Wetteravia, is a circle of the Upper Rhine, bounded by Weftphalia and Brunfwic on the north, by Franconia and Saxony on the eaft, by the river Maine on the fouth, and by another part of Weftphalia and the electorate of Mentz and Triers on the weft: it is fubject to the king of Sweden.

HESSE-DARMSTAT, is bounded by the river Maine, which divides it from Heffe-Caffel, on the north, by the fame river on the eaft, and by the Palatinate on the fouth and weft.

HETEROCLITE, among grammarians, one of the three variations in irregular nouns, and defined by Mr Ruddiman, a noun that varies in declenfion; as, *hoc vas, vafis: hæc vafa, vaforum.*

HETERODOX, in polemical theology, any thing contrary to the faith and doctrines of a church.

HETERODOMUS VECTIS, in mechanics, a lever, wherein the fulcrum, or point of fufpenfion, is placed between the power and the weight. See MECHANICS.

HETEROGENEITY, in phyfiology, that quality or property of bodies which denominates a thing heterogeneous. See the next article.

HETEROGENOUS, or HETEROGENEAL, fomething that confifts of parts of diffimilar kinds, in oppofition to homogeneous.

HETEROSCII, in geography, a term of relation, denoting fuch inhabitants of the earth as have their fhadows falling but one way, as thofe who live between the tropics and polar circles, whofe fhadows at noon in north latitude are always to the northward, and in fouth latitude to the fouthward.

HEUCHERA, in botany, a genus of the pentandria digynia clafs. The petals are five; and the capfule has a double beak, and two cells. There is but one fpecies, a native of Virginia.

HEXACHORD, in ancient mufic, a concord called by the moderns a fixth.

HEXAGON, in geometry, a figure of fix fides and angles; and if thefe fides and angles be equal, it is called a regular hexagon. See GEOMETRY.

HEXAHEDRON, in geometry, one of the five Platonic bodies, or regular folids; being the fame with a cube.

HEXAMETER, *carmen hexametrum*, in ancient poetry, a kind of verfe confifting of fix feet; the firft four of which may be indifferently either fpondees or dactyls, the fifth is generally a dactyl, and the fixth always a fpondee. Such is the following verfe of Horace:

1 2 3 4 5 6
Aut pro|deffe vo|lunt, aut|dele|ctare po|etæ.

HEXANDRIA, in botany. See BOTANY, p. 635.

HEXASTYLE, in architecture, a building with fix columns in front.

HEXHAM, a market-town of Northumberland, fixteen miles weft of Newcaftle.

HEYDON, a borough town in Yorkfhire, thirty-feven miles fouth-eaft of York, and fix miles weft of Hull. It fends two members to parliament.

HEYTSBURY, a borough town of Wiltfhire, fourteen miles north-weft of Salifbury, fends two members to parliament.

HIATICULA, in ornithology. See CHARADRIUS.

HIATUS, properly fignifies an opening, chafm, or gap; but it is particularly applied to thofe verfes, where one word ends with a vowel, and the following word begins with one, and thereby occafions the mouth to be more open, and the found to be very harfh.

The term hiatus is alfo ufed in fpeaking of manufcripts, to denote their defects, of the parts that have been loft or effaced.

HIBISCUS, in botany, a genus of the monadelphia polyandria clafs. The calix is double; the exterior one confifts of many leaves; the capfule has five cells, and contains many feeds. There are twenty-five fpecies, none of them natives of Britain.

HICCUP, or HICCOUGH, in medicine, a fpafmodic affection of the ftomach and diaphragm, arifing from any thing that irritates and vellicates their nervous coats. See MEDICINE.

HIDE, the fkin of beafts, but particularly applied to thofe of large cattle, as bullocks, cows, horfes, *&c.*

Hides are either raw or green, juft as taken off the carcafe; falted or feafoned with falt, alum, and faltpetre, to prevent their fpoiling; or curried and tanned. See TANNING.

HIDE *of land*, was fuch a quantity of land as might be plowed with one plough within the compafs of a year, or fo much as would maintain a family; fome call

call it fixty, fome eighty, and fome an hundred acres.

HIDE-BOUND. See FARRIERY, p. 563.

HIERACHIUM, HAWKWEED, in botany, genus of the fyngenefia polygamia æqualis clafs. The receptacle is naked; the calix is oval and imbricated; and the pappus is fimple and feffile. There are 28 fpecies, 8 of them natives of Britain. The leaves of the pilofella, or common creeping moufe-ear, are recommended as aftringents.

HIERACITES, in church-hiftory, Chriftian heretics in the third century, fo called from their leader Hierax, a philofopher of Egypt; who taught that Melchifedek was the Holy Ghoft, denied the refurrection, and condemned marriage.

HIERARCHY, among divines, denotes the fubordination of angels.

Some of the rabbins reckon four, others ten, orders or ranks of angels; and give them different names, according to their different degrees of power and knowledge.

HIERARCHY likewife denotes the fubordination of the clergy, ecclefiaftical polity, or the conftitution and government of the Chriftian church confidered as a fociety.

HIEROGLYPHICS, in antiquity, myftical characters, or fymbols, in ufe among the Egyptians, and that as well in their writings as infcriptions; being the figures of various animals, the parts of human bodies, and mechanical inftruments.

But befides the hieroglyphics in common ufe among the people, the priefts had certain myftical characters, in which they wrapped up and concealed their doctrines from the vulgar. It is faid, that thefe fomething refembled the Chinefe characters, and that they were the invention of Hermes. Sir John Marfham conjectures, that the ufe of thefe hieroglyphical figures of animals introduced the ftrange worfhip paid them by that nation: for as thefe figures were made choice of, according to the refpective qualities of each animal, to exprefs the qualities and dignity of the perfons reprefented by them, who were generally their gods, princes and great men, and being placed in their temples, as the images of their deities; hence they came to pay a fuperftitious veneration to the animals themfelves.

The meaning of a few of thefe hieroglyphics, has been preferved by ancient writers. Thus we are told they reprefented the fupreme Deity by a ferpent with the head of a hawk. The hawk itfelf was the hieroglyphic of Ofiris; the river-horfe, of Typhon; the dog, of Mercury; the cat, of the moon, or Diana; the beetle, of a couragious warrior; a new-born child, of the rifing fun; and the like.

HIEROGRAMMATISTS, *i. e.* holy regifters, were an order of priefts among the ancient Egyptians, who prefided over learning and religion.

They had the care of the hieroglyphics, and were the expofitors of religious doctrines and opinions. They were looked upon as a kind of prophets, and it is pretended that one of them predicted to an Egyptian king, that an Ifraelite, (meaning Mofes) eminent for his qualifications and atchievements, would leffen and deprefs the Egyptian monarchy.

HIEROMANCY, in antiquity, that part of divination which predicted future events from obferving the various things offered in facrifice. See DIVINATION and SACRIFICE.

HEROMNEMON, the name of an officer in the Greek church, whofe principal function it was to ftand behind the patriarch at the facraments and other ceremonies of the church, and to fhew him the prayers, pfalms, *&c.* in the order in which they were to be rehearfed.

HIEROPHANTES, in Grecian antiquity, the name by which the Athenians called thofe priefts and prieftefles who were appointed by the ftate to have the fupervifal of things facred, and to take care of the facrifices.

HIEROPHYLAX, an officer in the Greek church, who was guardian or keeper of the holy utenfils, veftments, *&c.* anfwering to our facrifta or veftry-keeper.

HIGH WAY, a free paffage for the king's fubjects, on which account it is called the king's high-way, tho' the freehold of the foil belong to the owner of the land. Thofe ways that lead from one town to another, and fuch as are drift or cart-ways, and are for all travellers in great roads, or that communicate with them, are high-ways only; and as to their reparation, are under the care of furveyors.

HIGHAM-FERRERS, a borough town of Northamptonfhire, twelve miles north-eaft of Northampton: it fends two members to parliament.

HIGHNESS, at title given to princes. Before king James I. the kings of England had no other title but that of highnefs; which was alfo the cafe of the kings of Spain before Charles V.

At prefent all the fons of crowned heads are ftyled royal highnefs, as the electors of Germany are electoral highnefs.

HIGHWORTH, or HIGWORTH, a market-town of Wiltfhire, fituated thirty miles north of Salifbury.

HILARIA, an ancient Roman feftival, obferved on the eighth of the calends of April, or the twenty-fifth day of March, in honour of the goddefs Cybele. It was fo called from the various expreffions of joy and mirth on this occafion.

HILARODI, in the ancient mufic and poetry, a fort of poets among the Greeks, who went about finging little gay poems or fongs, fomewhat graver than the Ionic pieces, accompanied with fome inftrument. From the ftreets they were at length introduced into tragedy, as the magodi were into comedy. They appeared dreffed in white, and were crowned with gold. At firft they wore fhoes, but afterwards they affumed the crepida, being only a fole tied over with a ftrap.

HILARY-TERM. See TERM.

HILDESHEIM, the capital of a bifhopric, furrounded by the territories of Brunfwic, and fubject to its own bifhop: E. long. 10°, N. lat. 52° 17′.

HILUM, among botanifts, denotes the eye of a bean.

HIN, a hebrew meafure of capacity for things liquid, containing the fixth part of an ephah, or one gallon two pints, or 2.533 folid inches, Englifh meafure.

HIND,

HIND, a female ſtag in the third year of its age. See CERVUS.

HINDON, a borough town of Wiltſhire, ſituated fourteen miles weſt of Saliſbury: it ſends two members to parliament.

HINDOWN, or HENDOWN, the capital of the country of the Hindowns, in the hither India: E. long. 76° 30′, N. lat. 27°.

HINE, or HIND, a huſbandman's ſervant. Thus the perſon who overſees the reſt, is called the maſter hine.

HIPPOBOSCA, or HORSE-FLY, in zoology, a genus of inſects belonging to the order of diptera. The beak conſiſts of two valves, is cylindrical, obtuſe, and hanging; and the feet have ſeveral claws. There are four ſpecies, diſtinguiſhed by their wings, *&c.* The equina is extremely troubleſome to horſes.

HIPPOCAMPUS, in ichthyology. See SYNGNATHUS.

HIPPOCENTAUR, in antiquity, a fabulous animal, half man half horſe.

What gave riſe to the fable of Hippocentaurs, was this. The Theſſalians are ſaid to have been the firſt inventors of the art of breaking horſes; and being firſt ſeen on horſeback, they ſeemed to make but one body with the horſes; whence the origin of the fable.

HIPPOCREPIS, COMMON HORSE-SHOE VETCH, in botany, a genus of the diadelphia decandria claſs. The pod is compreſſed and crooked. There are three ſpecies, only one of which, *viz.* the comoſa, or tufted horſe-ſhoe vetch, is a native of Britain.

HIPPODROME, in antiquity, the courſe where horſe-races were performed.

HIPPOGLOSSUS, in ichthyology, See PLEURONECTES.

HIPPOMANES ſignifies the expreſſed juice of the tithymallus; as alſo a juice diſtilling from the genitals of a mare, in the time of her covering: ſome again take it for the ſecundines of a mare; and, laſtly, it ſignifies a fleſhy ſubſtance adhering to the forehead of a colt newly foaled, which ſome imagine to have a virtue of procuring love, and promoting the birth.

HIPPOPHAE, in botany, a genus of the diœcia tetrandria claſs. The calix of the male has two ſegments; and the corolla is wanting The calix of the female conſiſts of two ſegments; it has no corolla; but one ſtylus; and the berry contains many ſeeds. There are three ſpecies, only one of which, *viz.* the rhamnoides, ſallow-thorn, or ſea buck-thorn, is a native of Britain.

HIPPOPOTAMUS, the RIVER-HORSE, a genus of quadrupeds, belonging to the order of belluæ; the characters of which are theſe: It has 6 foreteth in the upper jaw, diſpoſed in pairs at a diſtance from each other; and four prominent foreteeth in the under jaw, the intermediate ones being longeſt: the dog-teeth are ſolitary and obliquely truncated; and the feet are hoofed on the edges.

There is but one ſpecies of hippopotamus, *viz.* the amphibius, or river-horſe. The hiſtory of this quadruped, though next to the elephant in magnitude, is far from being ſufficiently delineated. The beſt deſcription hitherto given of him is that of Frederic Zerenghi, an Italian ſurgeon, publiſhed in the year 1603. Zerenghi killed two of them (a male and a female) on the banks of the Nile, preſerved their ſkins, and brought them to Rome. Every ſkin took 400 pounds of ſalt in curing. He ſays, the ſkin of the hippopotamus is about an inch thick, extremely hard, impenetrable by a common muſket-ball; and there are only a few ſhort white hairs ſcattered very thin over it. The teeth are not protruded out of the mouth, as is commonly believed; for, when the mouth is ſhut, although the teeth be extremely large, they are entirely covered by the lips. The dimenſions of the female, of which Zerenghi gives a figure, are as follow: From the point of the muzzle to the origin of the tail, between 11 and 12 feet; the circumference of the body about 10 feet; the height of the body, 4½ feet; the circumference of the leg, near the ſhoulder, 2 feet 9 inches, lower down 1 foot 9½ inches; the height of the legs about 1½ foot; the length of the feet from the extremity of the claws, 4½ inches; the claws are nearly of an equal length and breadth, and are ſomewhat more than two inches; each toe is furniſhed with a claw, and each foot with four toes. The tail is about one foot long, more than a foot in circumference near the origin, and about 3 inches near the point. The tail is not round, but flattiſh. The head, from the extremity of the lips to the neck, is about 2 feet 4 inches, and the circumference 5 feet 8 inches The ears are about 3 inches long, and nearly as broad; they are a little pointed, and covered in the interior ſide with ſhort white hair. The mouth, when open is about 1½ foot wide, and furniſhed with 44 teeth of different figures. Their teeth are of ſuch a hard ſubſtance, that they give fire with ſteel. Theſe dimenſions are taken from a female hippopotamus; but the male is generally about one third larger.

With ſuch powerful arms, and ſuch a prodigious ſtrength of body, the hippopotamus might render himſelf formidable to every other animal. But he is naturally of a mild diſpoſition; and beſides, his body is ſo heavy, and his motions ſo ſlow, that he cannot overtake any other quadruped. He ſwims ſwifter than he runs, and preys upon fiſhes. He dives in the water, and can ſtay very long under. He has no membrane betwixt his toes, as the caſtor or the otter; and he only ſwims eaſily in conſequence of the great bulk of his belly, which makes him nearly of an equal ſpecific gravity with the water Moreover, he often keeps himſelf at the bottom, and walks upon the channel with the ſame freedom as upon dry land. Beſides preying upon fiſhes, crocodiles, *&c.* he frequently goes out of the water and feeds upon ſugar-canes, ruſhes, millet, rice, roots, *&c.* Theſe he devours in large quantities, and often does great damage in the cultivated field. But as he is more timid on land than in the water, he is eaſily drove away. His legs are ſo ſhort, that he cannot eſcape by flight when at a diſtance from the river. He generally flies when approached by people in boats; but, if they wound him, he returns with fury, attacks the boats with his teeth, and frequently overſets them.

This animal ſeems to be confined principally to the rivers

rivers of Africa. The male and female generally go together, and the female is ſaid to produce but one at a birth.

HIPPURIS, in botany, a genus of the monandria monogynia claſs. It has neither calix nor corolla; the ſtigma is ſimple; and there is but one ſeed. There is only one ſpecies, *viz.* the vulgaris, a native of Britain.

HIPPURIS, in ichthyology, See CORYPHÆNA.

HIRCANIA, in geography, the provinces of Perſia in Aſia, which lie on the ſouthern ſhore of the Caſpian ſea.

HIRCHFIELD, a city of Germany, in the circle of the upper Rhine, and landgraviate of Heſſe Caſſel, ſituated on the river Fuld, in E. long. 9° 32′, N. lat. 50° 47′.

HIRTELLA, in botany, a genus of the triandria monogynia claſs. The calix is divided into five parts; the petals are five, and equal; the filaments are ſpiral, and the ſtylus is lateral. There is but one ſpecies, a native of Brazil.

HIRUDO, the LEECH, in zoology, a genus belonging to the order of vermes inteſtina. The body is flat, jointed, and moves either forward or backward. There are nine ſpecies, principally diſtinguiſhed by that colour. This well known animal is uſed for bleeding children, *&c.* When they once fix, they ſeldom quit till they are glutted with blood. Salt makes them quit their hold, and throw up the blood.

HIRUNDO, in ornithology, a genus of birds, of the order of paſſeres. The bill is ſmall, crooked, ſubulated, bent a little inward, and depreſſed at the baſe. There are 12 ſpecies, principally diſtinguiſhed by their colour. This includes the common ſwallow, martin, *&c.*

HISPANIOLA, an iſland of America, in the Atlantic ocean, ſituated between 67° and 74° of W. long. and between 18° and 20° N lat. being about 420 miles long from eaſt to weſt, and 120 in breadth. It is frequently called St. Domingo, from the capital thereof.

HISTORIOGRAPHER, a profeſſed hiſtorian, or writer of hiſtory.

HISTORY, a deſcription or recital of things as they are, or have been, in a continued orderly narration of the principal facts and circumſtances thereof.

Hiſtory, with regard to its ſubject, is divided into the hiſtory of Nature, (See NAT. HIST.) and the hiſtory of Actions. The hiſtory of Actions is a continued relation of a ſeries of memorable events.

HISTRIO, in the ancient drama, ſignified an actor or comedian, but more eſpecially a pantomime, who exhibited his part by geſtures and dancing.

HITCHING, a market-town in Hartfordſhire, fourteen miles north-weſt of Hartford, and thirty-two north-weſt of London.

HITHE, one of the Cinque Ports in the county of Kent, ſituated on the Engliſh channel, ſix miles weſt of Dover.

HIVE, in country affairs, a convenient receptacle for bees. See APIS.

HIVING *of Bees*. See APIS.

HOACHE, in natural hiſtory, a kind of earth approaching to the nature of chalk, but harder, and feeling like ſoap; whence ſome think, that it is either the ſame with our ſoap rock of Cornwal, or very like it. The Chineſe diſſolve it in water, till the liquor is of the conſiſtence of cream, and then varniſh their china-ware with it.

HOAR-HOUND, in botany. See MARUBIUM.

HOARSENESS, in medicine, a diminution of the voice, commoly attended with a preternatural aſperity or roughneſs thereof

HOBBY, in ornithology. See FALCO.

HOE, in country-affairs, a tool made like a cooper's adz, to cut upwards in gardens, field, *&c.* This tool is commonly called the hand-hoe. See AGRICULTURE.

HOG, in zoology. See SUS.

HOGSHEAD, in commerce, a meaſure of capacity, containing ſixty-three gallons.

HOGUE, a town and cape on the north-weſt point of Normandy in France, near which admiral Rook burnt the French admiral's ſhip called the Riſing-ſun, with twelve more large men of war: W. lon. 2°, and N. lat. 49° 50′.

HOHIO, a river of North America; which riſing in the Apalachian mountains, near the confines of Carolina and Virginia, runs ſouth weſt, and falls into the river Miſſiſſipi.

HOKE-DAY, the Tueſday after eaſter-week; which was the day on which the Engliſh conquered and expelled the Danes: this was therefore kept as a day of rejoicing; and a duty, called hoke-tueſday-money, was paid to the landlord, for giving his tenants and bondmen leave to celebrate it.

HOLCUS, in botany, a genus of the polygamia monœcia claſs. The calix of the hermaphrodite is a double-flowered glume; the corolla is a glume with an awn; and there are three ſtamina, two ſtyli, and one ſeed. The calix of the male is a double valved glume; it has no corolla, but three ſtamina. There are ten ſpecies, only two of them natives of Britain, *viz.* the lanatus, or meadow ſoft-graſs; and the mollis, or creeping ſoft-graſs

HOLDERNESS, a peninſula in the eaſt riding of Yorkſhire, which has the German ocean on the eaſt, and the river Humber on the ſouth.

HOLDING, in Scots law, the tenor or terms upon which a proprietor of lands holds or enjoys them of his ſuperior.—See BLENCH, BURGAGE, FEU, WARD.

HOLLAND, one of the United Provinces. It is about one hundred miles long from north to ſouth, and ſcarce thirty miles broad; but enjoys the greateſt trade of any province in the world, and in point of ſtrength and riches is equal to the other ſix united provinces. It is ſituated one hundred miles eaſt of England, and is bounded on the north and weſt by the German ſea, on the eaſt by the Zuider ſea, and on the ſouth by the provinces of Zealand and Utrecht.

HOLLAND is alſo the name of the ſouth-eaſt diviſion of Lincolnſhire.

HOLLAND, in commerce, a fine and cloſe kind of linen,

linen, ſo called from its being firſt manufactured in Holland.

HOLLY, in botany. See ILEX.

Sea-HOLLY. See ERYNGIUM.

HOLOCAUST, a burnt-offering, or ſacrifice, wholly conſumed by fire: of this kind was the daily ſacrifice in the Jewiſh church. This was done by way of acknowledgment, that the perſon offering and all that belonged to him, were the effects of the divine bounty.

HOLOGRAPH, among civilians, a will wholly written by the hand of the teſtator.

HOLSTEIN, a dutchy of Germany, in the circle of lower Saxony, one hundred miles long, and fifty broad. It is bounded by Sleſwic or ſouth Jutland on the north, by the Baltic ſea and the duchy of Sax-Lawenburg on the eaſt, by the riven Elbe on the ſouth, and by the German ſea on the weſt.

HOLY-GHOST, one of the Perſons of the Holy Trinity.

Order of the HOLY GHOST, the principal military order in France, inſtituted by Henry III. in 1569. It conſiſts of an hundred knights, who are to make proof of their nobility for three deſcents. The king is the grand-maſter, or ſovereign; and as ſuch, takes an oath on his coronation-day, to maintain the dignity of the order.

HOLY-DAYS. See FESTIVAL.

HOLY-HEAD, a cape and town in the iſle of Angleſea, ſituated in the Iriſh channel: W. long. 4° 45′, and N. lat. 53° 26′.

HOLY-ISLAND, an iſland in the German ſea, ſix miles ſouth of Berwick upon Tweed: W. long. 1° 42′, and N. lat. 55° 45′.

HOLY-WELL, a town of north Wales, in Flintſhire, ten miles eaſt of St. Aſaph.

HOMAGE, in law, is the ſubmiſſion, loyalty, and ſervice which a tenant promiſed to his lord, when he was firſt admitted to the land which he held of the lord in fee: alſo that owing to a king, or to any ſuperior.

HOMBERG, a town of Germany, in the circle of the upper Rhine, and landgraviate of Heſſe, ſituated ten miles north of Francfort: E. long. 8° 24′, N. lat. 50° 20′.

HOMBERG is alſo a town of Germany, in the palatinate of the Rhine, and dukedom of Deuxponts: E. long. 7° 6′. and N. lat. 49° 20′.

HOMER. See OMER.

HOMICIDE, ſignifies in general the taking away of any perſon's life. See SCOTS LAW, tit. 33.

HOMILY, in eccleſiaſtical writers, a ſermon, or diſcourſe, upon ſome point of religion, delivered in a plain manner, ſo as to be eaſily underſtood by the common people.

HOMO, MAN, is ranked by Linnæus under the order of primates, and characteriſed by having four parallel foreteeth both in the upper and lower jaw, and two mammæ on the breaſt. The ſpecies, according to this author, are two, *viz.* the homo ſapiens, and the homo troglodytes. He ſubdivides the homo ſapiens into five varieties, *viz.* the American, the European, the Aſiatic, the African, and what he calls the monſtrous. The troglodytes, or orang outang, is a native of Athiopia, Java, and Amboina. His body is white; he walks erect; and is about one half the ordinary human ſize. He generally lives about 25 years. He conceals himſelf in caves during the day, and ſearches for his prey in the night. He is ſaid to be exceedingly ſagacious, but is not endowed with the faculty of ſpeech.

HOMOLOGOUS, in geometry, an appellation given to the correſponding ſides and angles of ſimilar figures, as being proportional to each other.

HONAN, a province of China, bounded by thoſe of Xanſi and Pekin on the north, by Xantong and Nankin on the eaſt, by Suchuen on the ſouth, and by Xenſi on the weſt; lying between 33° and 37° north latitude. Its capital is Caifum.

HONDURAS, a province of Mexico, in North America; which including the country of the Moſkito-Indians, is ſituated between 85° and 94° W. long. and between 12° and 16° N. lat.

HONE, a fine kind of whiteſtone, uſed for ſetting razors, pen-knives, and the like.

HONEY, is, in general, a thick, viſcous, and more or leſs fluid ſubſtance, of a whitiſh or yellowiſh colour, ſweet to the taſte, ſoluble in water, becoming vinous in fermentation, inflammable, liquable by a gentle heat, and of a fragrant ſmell. See APIS.

HONFLEUR, a port-town of France, in the province of Normandy, ſituated on the ſouth ſide of the river Seyne, near the Engliſh channel: E. long. 15′, and N. lat. 49° 24′.

HONITON, a borough-town of Devonſhire, twelve miles eaſt of Exeter. It ſends two members to parliament.

HONOUR, a teſtimony of eſteem or ſubmiſſion, expreſſed by words, actions, and an exterior behaviour, by which we make known the veneration and reſpect we entertain for any one on account of his dignity or merit. The word honour is alſo uſed in general for the eſteem due to virtue, glory, and reputation. It is alſo uſed for virtue and probity themſelves, and for an exactneſs in performing whatever we have promiſed; and in this laſt ſenſe we uſe the term, *a man of honour*. But honour is more particularly applied to two different kinds of virtue, bravery in men, and chaſtity in women.

Maids of HONOUR, are ſix young ladies in the houſehold of the queen and princeſs-royal; the ſalary of thoſe of a queen are 300 l. per ann. each, and thoſe of the princeſs dowager of Wales, 200 l.

HONOUR-POINT, in heraldry, is that next above the centre of the eſcutcheon, dividing the upper part into two equal portions.

HOOF, the horny ſubſtance that covers the feet of divers animals, as oxen, horſes, ſheep, *&c.*

HOOKS are a neceſſary ſort of utenſils, and uſed for various purpoſes.

HOOKER, in naval architecture, a veſſel much uſed by the Dutch, built like a pink, but rigged and maſted like a hoy.

Hookers will lie nearer a wind than veſſels with croſs ſails can do. They are from fifty to two hundred tons burden, and with a few hands will ſail to the Eaſt Indies.

HOP, in botany. See HUMULUS.

New land is found to fucceed better with hops than old; and on this principle they are very cautious in their plantations in Kent, and look forward for the after-produce. When they make a new hop-ground, they plant it with apple-trees at a large diftance afunder, and with cherry trees between; by this means, when the hops have grown ten years, which they judge as much as they will do well, they place their account in the cherry-trees, which bear large crops; thefe they gather for about thirty years, and then they cut them up, and depend upon their apple-trees only, which they find very large and ftrong by that time.

The dry ftalks of hops fhould be burnt on the ground in winter, covering them with a little frefh earth as they burn. This makes together an excellent compoft, to make the hills of. The land muft be dug or plowed well, and laid very even, and then the places for the hills marked out by a line, and a ftick put in every place where one is to be. A thoufand hills may be made in an acre of ground, and fix or feven plants fet on every hill. From fix to nine feet fhould be allowed between every hill, and the grounds in the hills fhould be better and richer than the common earth. Some plant hops in March and April, but the moft experienced people prefer the month of October, becaufe they will then ftrike firm roots, and be ftrong and vigorous againft fpring. The largeft plants are to be chofen; and it is beft to procure them from fome rich ground, where the hills have been laid high; they fhould be about eight or ten inches long, and have three or four joints or buds a-piece; the holes for planting them are to be dug eight or ten inches deep, and about a foot over; and in each of thefe holes four plants are to be fet, one in each corner: they may be covered an inch deep over the top, if planted in October; but in fpring, when they have fhot from the joints, then they muft not be buried: after this, the ground muft be carefully kept clear of weeds.

Dreffing of HOPS. This is preparing the ground in winter and fpring for the making a good fummer-crop. In doing this, the hills upon which the plants ftand muft be all pulled down, and undermined on every fide, till the fpade comes near the principal root; then fhake off or remove with the hand the loofe mould from the upper or loofe roots, that you may fee where the new roots grow out of the old fets. The old fets are to be carefully preferved, but the other roots may be cut away. Whatever time the hills are pulled down, the roots muft not be cut till March. When the young hops are dreffed for the firft time, all the roots are to be cut away that grew the year before, and the fets are to be cut off within one inch of the fame; and every year after, they muft be cut as clofe as may be to the old roots; but to a weak hop, fome of the fhoots are to be left at the dreffing. Thofe roots of the plant which grow downwards, are never to be injured, but only thofe which run horizontally are to be cut. The old roots and the young ones may be eafily diftinguifhed, in that the old ones are always red, and the young white. If there are by accident any wild hops got among the reft, the places where they grow are to be marked with fticks, or otherwife, at the time of their being gathered; and after this, at the time of dreffing the ground, that whole hill is to be deftroyed, and a new one made with new plants in the room of it. When the roots are cut and dreffed, the rich compoft is to be put to them; and the hills muft not be made too high at firft, left they hinder the young fhoots.

Gathering and drying of HOPS. Hops blow in the latter end of July, in the beginning of Auguft they bell; and they are fometimes ripe at the beginning of September, fometimes later. When they begin to change colour, are eafily pulled to pieces, and their feeds look brown within them, they are ripe; and they are then to be gathered as quick as poffible, for the leaft blaft of wind will hurt them at this time.

The manner of gathering hops, is to take down four hills ftanding together in the midft of the garden, and to cut the roots even with the ground, then lay the ground level; and when it is fwept clean, it makes a floor, on which the hops may be laid and picked. The hop-plants are firft unwound from the poles, and then the people fit round and pick off the hops into bafkets.

Care fhould be taken to dry the hops as faft as they are picked, for in lying undried they are apt to heat and change colour very quickly. If the quantity picked be fo large, that the kiln in which they are to be dried is over-ftocked, they muft be fpread thin upon a floor, and they will keep two or three days in that manner without any harm. Indeed, where the quantity is but fmall, there is no need to have recourfe to the kiln at all, for they will dry much better than any other way, by being laid thin upon a floor, and often turned. The drying of hops is the moft material part of their manufacture; for if they be ill dried, they lofe all their agreeable flavour; and great caution fhould be ufed, that they be all equally dried.

Bagging of HOPS, a term ufed by the farmers, who cultivate hops, for the laft thing they have to do with with them, in order to bring them to market; that is, the putting them up in large bags of coarfe cloth, for carriage. When the hops have been picked and dried in the ooft, or tin-floor, they are fo brittle that they would break to pieces and be fpoiled if they were immediately to be put up; they are therefore to lie together three weeks, or thereabouts, that they may become tough: if they are covered from the air by blankets in the heap, they may be bagged much fooner than if left open.

The manner of bagging them is this; a hole is made in an upper-floor, fo large that a man may eafily go up and down it; then a hoop is fitted to the mouth of the bag, and fo firmly fewed on, that it cannot be torn off; the bag is then let down through the hole, and the hoop remaining above, ftops it from being pulled quite through, being larger than the hole: a few hops are to be firft thrown into the bag, and a perfon below is to take up a parcel of thefe in each corner of the bag, tying it with a packthread; this makes a fort of taffel, by which the bags are afterwards the eafier managed and

and turned about. When this is done, one man muſt go down into the bag, and, while another caſts in the hops, he muſt tread them down equally every way with his feet; when the bag is in this manner filled, it is to be ripped from the hoop, and ſewed up, leaving two taſſels at the corners, as at the bottom. A bag of hops thus prepared, may be kept for ſeveral years in a dry place.

The tops of this plant, being of a cooling quality, are eaten, when boiled, as an emollient. A decoction of hop-flowers is alſo accounted an antidote againſt poiſon, and cures the itch, as well as the ſyrup thereof, and is eſteemed excellent in choleric and peſtilential fevers. The heads and tendrils are good in the ſcurvy and moſt cutaneous diſeaſes. Juleps and apozems are alſo prepared with hops for hypochondriacal and hyſterical affections, and to promote the menſes: but the chief uſe of this plant conſiſts in preſerving beer and other malt-liquors (in which the flower of this plant is a principal ingredient) from turning ſowr, and rendering it wholeſome and grateful to the taſte, *&c.*

HORD, in geography, is uſed for a company of wandering people, which have no ſettled habitation, but ſtroll about, dwelling in waggons, or under tents, to be ready to ſhift as ſoon as the herbage, fruit, and the preſent province is eaten bare: ſuch are ſeveral tribes of the Tartars, particularly thoſe who inhabit beyond the Wolga, in the kingdom of Aſtracan and Bulgaria.

HORDEUM, BARLEY, in botany, a genus of the triandria digynia claſs. The involucrum conſiſts of ſix leaves, and contains three flowers. There are eight ſpecies, only one of which, *viz.* the murinum, or wall-barley-graſs, is a native of Britain. The native place of the vulgare, or common barley cultivated in our fields, is not known. For the culture, *&c.* of common barley, ſee AGRICULTURE, p. 61.

HORDICALIA, or HORDICIDIA, in antiquity, a religious feaſt held among the Romans, wherein they ſacrificed cattle big with young. This feaſt fell on April 15. on which day they ſacrificed thirty cows with calf to the goddeſs Tellus or the Earth; part of them were ſacrificed in the temple of Jupiter. The calves taken out of their bellies were burnt to aſhes at firſt by the pontifices, afterwards by the eldeſt of the veſtal virgins.

HOREHOUND, BALLOTA, STACHYS, in botany. See MARUBIUM.

HORIZON, in aſtronomy and geography, that great circle which divides the heavens and the earth into two equal parts, or hemiſpheres, diſtinguiſhing the upper from the lower. See ASTRONOMY and GEOGRAPHY.

HORIZONTAL, ſomething relating to the horizon; or that is taken in, or on a level with the horizon: thus we ſay, an horizontal plane, *&c.*

HORMINUM, CLARY, in botany, a genus of the didynamia gymnoſpermia claſs. The calix is bell-ſhaped, with four nearly equal ſegments, and a fifth larger and emarginated; and the upper labium of the corolla is concave. There are two ſpecies, none of them natives of Britain.

HORN, a hard ſubſtance growing on the heads of divers animals, particularly the cloven-footed quadrupeds; and ſerving them both as weapons of offence and defence.

HORN-BEAM, in botany. See CARPINUS.

HORN-WORK, in fortification, an out-work compoſed of two demi-baſtions, joined by a curtin. See FORTIFICATION.

HORNET, in zoology. See APIS.

HORNING, in Scots law, a writing iſſuing from the ſignet, in his Majeſty's name, at the inſtance of a creditor againſt his debtor, commanding him to pay or perform within a certain time. See DENUNCIATION, —and LAW, tit. 12. §. 13. 14.

HORNSEY, a market-town of the eaſt riding of Yorkſhire, thirty-five miles eaſt of York.

HOROGRAPHY. See DIALLING.

HOROLOGIUM, a general name for inſtruments to meaſure the hours, as a watch, clock, dial, *&c.* See WATCH.

HOROSCOPE, in aſtrology, is the degree of the aſcendent, or the ſtar that riſes above the horizon at a certain moment, which is obſerved in order to predict ſome future event, as the ſucceſs of a deſign, the fortune of a perſon who was at that inſtant born, *&c.*

HORSE, in zoology. See EQUUS.

HORSEMANSHIP;

Or, The Art of Riding, and of Training and Managing HORSES.

The method of preparing horſes to be mounted.

THOUGH all horſes are generally bought at an age when they have already been backed, they ſhould be begun and prepared for the rider with the ſame care, gentleneſs and caution, as if they had never been handled or backed, in order to prevent accidents, which might elſe ariſe from ſkittiſhneſs or other cauſes: and as it is proper that they ſhould be taught the figure of the ground they are to go upon, when they are at firſt mounted, they ſhould be previouſly trotted in a *longe* on circles, without any one upon them.

The manner of doing this is as follows: Put an eaſy *caveſſon* upon the horſe's noſe, and make him go forwards round you, ſtanding quiet and holding the *longe*; and let another man, if you find it neceſſary, follow him with a whip. All this muſt be done very gently, and but a little at a time: for more horſes are ſpoilt by over-much work, than by any other treatment whatever; and that by

by very contrary effects; for sometimes it drives them into vice, madness and despair, and often stupifies and totally dispirits them.

The first obedience required in a horse is going forwards: Till he performs this duty freely, never even think of making him rein back, which would inevitably make him restive: As soon as he goes forwards readily, stop and caress him. You must remember in this, and likewise in every other exercise, to use him to go equally well to the right and left; and when he obeys, caress him and dismiss him immediately. If a horse, that is very young, takes fright and stands still, lead on another horse before him, which probably will induce him instantly to follow. Put a snaffle in his mouth; and when he goes freely, saddle him, girting him at first very loose. Let the cord, which you hold, be long and loose; but not so much, so as to endanger the horse's entangling his legs in it. It must be observed, that small circles, in the beginning, would constrain the horse too much, and put him upon defending himself. No bend must be required at first: never suffer him to gallop false; but whenever he attempts it, stop him without delay, and then set him off afresh. If he gallops of his own accord, and true, permit him to continue it; but if he does it not voluntarily, do not demand it of him at first. Should he fly and jump, shake the cord gently upon his nose without jerking it, and he will fall into his trot again. If he stands still, plunges or rears, let the man who holds the whip, make a noise with it; but never touch him, till it be absolutely necessary to make him go on. When you change hands, stop and caress him, and entice him by fair means to come up to you: For by presenting yourself, as some do, on a sudden before horses, and frightening them to the other side, you run a great risk of giving them a shyness. If he keeps his head too low, shake the *cavesson* to make him raise it: And in whatever the horse does, whether he walks, trots, or gallops, let it be a constant rule, that the motion be determined and really such as is inteded, without the least shuffling, pacing, or any other irregular gait.

The method of placing the rider and rendering him firm on horseback, with some occasional instructions for riders and the horses.

It is necessary that the greatest attention, and the same gentleness, that is used in teaching the horses, be observed likewise in teaching the rider, especially at the beginning. Every method and art must be practised to create and preserve, both in man and horse, all possible feeling and sensibility, contrary to the usage of most riding masters, who seem industriously to labour at abolishing these principles both in one and the other. As so many essential points depend upon the manner in which a man is at first placed on horseback, it ought to be considered and attended to with the strictest care and exactness.

The absurdity of putting a man, who perhaps has never before been upon a horse, on a rough trotting horse, on which he is obliged to stick with all the force of his arms and legs, is too obvious to need mentioning. This rough work, all at once, is plainly as detrimental at first, as it is excellent afterwards in proper time. No man can be either well, or firmly seated on horseback, unless he be master of the balance of his body, quite unconstrained, with a full possession of himself, and at his ease; none of which requisites can he enjoy, if his attention be otherwise engaged; as it must wholely be in a raw, unsuppled, and unprepared lad, who is put at once upon a rough horse: in such a distressful state he is forced to keep himself on at any rate, by holding to the bridle, (at the expence of the sensibility both of his own hand, and the horse's mouth,) and by clinging with his legs, in danger of his life, and to the certain depravation of a right feeling in the horse.

The first time a man is put on horseback, it ought to be upon a very gentle one, He never should be made to trot, till he is quite easy in the walk; nor gallop, till he is able to trot properly. The same must be observed in regard to horses: they should never be made to trot, till they are obedient, and their mouths are well formed on a walk; nor be made to gallop, till the same be effected on a trot. When he is arrived at such a degree of firmness in his seat, the more he trots, and the more he rides rough horses, the better. This is not only the best method, but also the easiest and the shortest: by it, a man is soon made sufficiently an horseman for a soldier; but by the other detestable methods, that are commonly used, a man, instead of improving, contracts all sorts of bad habits, and rides worse and worse every day; the horse too becomes daily more and more unfit for use. In proceeding according to the manner proposed, a man is rendered firm and easy upon the horse, both his own and the horse's sensibility is preserved, and each in a situation fit to receive and practise all lessons effectually.

Among the various methods that are used of placing people on horseback, few are directed by reason. Before you let the man mount, teach him to know, and always to examine, if the curb be well placed, (that is, when the horse has a bit in his mouth, which at first he should not; but only a snaffle, till the rider is firm in his seat, and the horse also somewhat taught;) and likewise if the nose-band be properly tight; the throat band loosish, and the mouth-piece neither too high nor too low in the horse's mouth, but rightly put so as not to wrinkle the skin, nor to hang lax; the girts drawn moderately, but not too tight; and the crupper and the breast plate properly adjusted. A very good and careful hand may venture on a bit at first, and succeed with it full as well, as by beginning with a snaffle alone: on colts, indeed, it is better, in all schools whatsoever, to avoid any pressure on the bars just at first, which a curb, though ever so delicately used, must in some degree occasion. When the bridle, *&c.* have been well looked to, let the man approach the horse gently near the shoulder; then taking the reins and an handful of the mane in his left hand, let him put his foot softly in the left stirrup, by pulling it towards him, least he touch the horse with his toe, then raising himself up, let him rest a moment on it with his body upright, but not stiff: and after that passing his right leg clear over the saddle without rubbing against any thing, let him seat himself gently down. He must

be

be cautious not to take the reins too ſhort, for fear of making the horſe rear, run, or fall back, or throw up his head; but let him hold them of an equal length, neither tight nor ſlack, and with the little finger betwixt them. It is fit that horſes ſhould be accuſtomed to ſtand ſtill to be mounted, and not to ſtir till the rider pleaſes. All ſoldiers ſhould be inſtructed to mount and diſmount equally well on both ſides, which may be of very great uſe in times of hurry and confuſion. Then place the man in his ſaddle, with his body rather back, and his head held up with eaſe, without ſtiffneſs; ſeated neither forwards, nor very backwards, with the breaſt puſhed out a little, and the lower part of the body likewiſe a little forwards; the thighs and legs turned in without conſtraint, and the feet in a ſtraight line, neither turned in nor out: By this poſition, the natural weight of the thighs has a proper and ſufficient preſſure of itſelf, and the legs are in readineſs to act, when called upon: they muſt hang down eaſy and naturally, and be ſo placed, as not to be wriggling about, touching and tickling the horſe's ſides, but always near them in caſe they ſhould be wanted, as well as the heels.

The body muſt be carefully kept eaſy and firm, and without any rocking, when in motion; which is a bad habit very eaſily contracted, eſpecially in galloping. The left elbow muſt be gently leant againſt the body, a little forwards; unleſs it be ſo reſted, the hand cannot be ſteady, but will be always checking, and conſequently have pernicious effects on the horſe's mouth: and the hand ought to be of equal height with the elbow; if it were lower, it would conſtrain and confine the motion of the horſe's ſhoulders; but, as the mouths of horſes are different, the place of the hand alſo muſt occaſionally differ: a leaning, low, heavy fore hand requires a high hand; and a horſe that pokes out his noſe, a low one. The right hand arm muſt be placed in ſymmetry with the left; only let the right hand be a little forwarder or backwarder, higher or lower, as occaſions may require, in order that both hands may be free: both arms muſt be a little bent at the elbow, to prevent ſtiffneſs.

A ſoldier's right hand ſhould be kept unemployed in riding; it carries the ſword, which is a ſufficient buſineſs for it.

There remains one farther obſervation, that ought not to be omitted, about the hand, that it muſt be kept clear of the body; *i. e.* about two inches and half forwards from it, with the nails turned oppoſite to the belly, and the wriſt a little rounded with eaſe; a poſition not leſs graceful than ready for ſlackening, tightening, and moving the reins from on ſide to the other, as may be found neceſſary.

When the men are well placed, the more rough trotting they have without ſtirrups, the better; but with a ſtrict care always, that their poſition be preſerved very exactly. In all caſes, great care muſt be taken to hinder their clinging with their legs: In ſhort, no ſticking by hands or legs is ever to be allowed of at any time. If the motion of the horſe be too rough, ſlacken it, till the rider grows by degrees more firm: and when he is quite firm and eaſy on his horſe in every kind of motion, ſtirrups may be given him; but he muſt never leave off trotting often without any.

The ſtirrups muſt be neither ſhort nor long; but of ſuch a length, that when the rider, being well placed, puts his feet into them, (about one third of the length of each foot from the point of it,) the points may be between two and three inches higher than the heels. The rider muſt not bear upon his ſtirrups, but only let the natural weight of his legs reſt on them: For if he bear upon them, he would be raiſed above and out of his ſaddle; which ſhould never be, except in charging ſword in hand, with the body inclined forwards at the very inſtant of attacking. Spurs may be given, as ſoon as the rider is grown familiar with ſtirrups, or even long before, if his legs are well placed.

A hand ſhould always be firm, but delicate: a horſe's mouth ſhould never be ſurpriſed by any ſudden tranſition of it, either from ſlack to tight, or from tight to ſlack. Every thing in horſemanſhip muſt be effected by degrees, but at the ſame time with ſpirit and reſolution. That hand which, by giving and taking properly, gains its point with the leaſt force, is the beſt; and the horſe's mouth, under this ſame hand's directions, will alſo conſequently be the beſt, ſuppoſing equal advantages in both from nature. This principle of gentleneſs ſhould be obſerved upon all occaſions in every branch of horſemanſhip. Sometimes the right hand may be neceſſary, upon ſome troubleſome horſes, to aſſiſt the left; but the ſeldomer this is done, the better; eſpecially in a ſoldier, who has a ſword to carry, and to make uſe of.

The ſnaffle muſt on all occaſions be uppermoſt; that is to ſay, the reins of it muſt be above thoſe of the bridle, whether the ſnaffle or the bit be uſed ſeperately, or whether they be both uſed together. When the rider knows enough, and the horſe is ſufficiently prepared and ſettled to begin any work towards ſuppling, one rein muſt be ſhortened according to the ſide worked to; but it muſt never be ſo much ſhortened, as to make the whole ſtrength reſt on that rein alone; for, not to mention that the work would be falſe and bad, one ſide of the horſe's mouth would by that means be always deadened; whereas on the contrary, it ſhould always be kept freſh by its own play, and by the help of the oppoſite rein's acting delicately in a ſomewhat ſmaller degree of tenſion; the joint effect of which produces in a horſe's mouth the proper, gentle and eaſy degree of *appui* or bearing.

A coward and a madman make alike bad riders, and are both alike diſcovered and confounded by the ſuperior ſenſe of the creature they are mounted upon, who is equally ſpoilt by both, though in very different ways. The coward, by ſuffering the animal to have his own way, not only confirms him in his bad habits, but creates new ones in him: and the madman, by falſe and violent motions and corrections, drives the horſe, through deſpair, into every bad and vicious trick that rage can ſuggeſt.

It is very requiſite in horſemanſhip, that the hand and legs ſhould act in correſpondence with each other in every thing; the latter always ſubſervient and aſſiſtant to the former. Upon circles, in walking, trotting, or galloping, the outward leg is the only one to be uſed, and that only for a moment at a time, in order to ſet off the horſe true,

true, or put him right, if he be falfe; and as foon as that is done, it muft be taken away again immediately: but if the horfe be lazy, or otherwife retains himfelf, both legs muft be ufed, and preffed to his fides at the fame time together. The lefs the legs are ufed in general, the better. Very delicate good riders, with horfes they have dreffed themfelves, will fcarcely ever want their help. By the term *outward* is underftood the fide which is more remote from the centre; and by *inward* is meant the fide next to the centre. In reining back, the rider fhould be careful not to ufe his legs, unlefs the horfe backeth on his fhoulders; in which cafe they muft be both applied gently at the fame time, and correfpond with the hand. If the horfe refufe to back at all, the riders legs muft be gently approached, till the horfe lifts up a leg, as if to go forwards; at which time, when that leg is in the air, the rein of the fame fide with that leg, which is lifted up, will eafily bring that fame leg backwards, and accordingly oblige the horfe to back: but if the horfe offers to rear, the legs muft be inftantly removed away. The inward rein muft be the tighter on circles, fo that the horfe may bend and look inwards; and the outward one croffed over a little towards it; and both held in the left hand.

Let the man and horfe begin on very flow motions, that they may have time to underftand, and reflect on what is taught them; and in proportion as the effects of the reins are better comprehended, and the manner of working becomes more familiar, the quicknefs of motion muft be increafed. Every rider muft learn to feel, without the help of the eye, when a horfe goes falfe, and remedy the fault accordingly: this is an intelligence, which nothing but practice, application and attention can give, in the beginning on flow motions. A horfe may not only gallop falfe, but alfo trot and walk falfe. If a horfe gallops falfe, that is to fay, if going to the right, he leads with the left leg; or if going to the left, he leads with the right; or in cafe he is difunited, *i. e.* if he leads with the oppofite leg behind to that which he leads with before; ftop him immediately, and put him off again properly: the method of effecting this, is by approaching your outward leg and putting your hand outwards, ftill keeping the inward rein the fhorter, and the horfe's head inwards, if poffible; and if he fhould ftill refift, then bend and pull his head outwards alfo, but replace it again, bent properly inwards, the moment he goes off true. A horfe is faid to be difunited to the right, when going to the right, and confequently leading with the right leg before, he leads with the left behind; and is faid to be difunited to the left, when going to the left, and confequently leading with the left leg before, he leads with the right behind. A horfe may at the fame time be both falfe and difunited; in correcting both which faults, the fame method muft be ufed. He is both falfe and difunited to the right, when in going to the right he leads with the left leg before, and the right behind; notwithftanding that hinder leg be with propriety more forward under his belly than the left, becaufe the horfe is working to the right: and he is falfe and difunited to the left, when in going to the left he leads with the right leg before, and the left behind; notwithftanding, as above, that hinder leg be with propriety more forward under his belly than the right, becaufe the horfe is working to the left.

In teaching men a right feat on horfeback, the greateft attention muft be given to prevent ftiffnefs, and fticking by force in any manner upon any occafion: ftiffnefs difgraces every right work; and fticking ferves only to throw a man (when difplaced) a great diftance from his horfe by the fpring he muft go off with: whereas by a proper equilibrating pofition of the body, and by the natural weight only of the thighs, he cannot but be firm, and fecure in his feat.

As the men become more firm, and the horfes more fupple, it is proper to make the circles lefs, but not too much fo, for fear of throwing the horfes forwards upon their fhoulders.

Some horfes, when firft the bit is put into their mouths, if great care be not taken, will put their heads very low. With fuch horfes, raife your right hand with the *bridoon* in it, and play at the fame time with the bit in the left hand, giving and taking.

On circles, the rider muft lean his body inwards; unlefs great attention be given to make him do it, he will be perpetually loofing his feat outwards. It is fcarce poffible for him to be difplaced if he leans his body properly inwards.

The method of fuppling horfes with men upon them, by the EPAULE en dedans, *&c. with and without a* longe, *on circles and on ftrait lines.*

WHEN a horfe is well prepared and fettled in all his motions, and the rider firm, it will be proper then to proceed on towards a farther fuppling and teaching of both.

In fetting out upon this new work, begin by bringing the horfe's head a little more inwards than before, pulling the inward rein gently to you by degrees. When this is done, try to gain a little on the fhoulders, by keeping the inward rein the fhorter, as before, and the outward one croffed over towards the inward one. The intention of thefe operations is this; the inward rein ferves to bring in the head, and procures the bend; whilft the outward one, that is a little croffed, tends to make that bend perpendicular, and as it fhould be, that is to fay, to reduce the nofe and the forehead to be in a perpendicular line with each other: it alfo ferves, if put forwards, as well as alfo croffed, to put the horfe forwards, if found neceffary, which is often requifite, many horfes being apt in this and other works rather to lofe their ground backwards than otherwife, when they fhould rather advance: if the nofe were drawn in towards the breaft beyond the perpendicular, it would confine the motion of the fhoulders, and have other bad effects. All other bends, befides what are above fpecified, are falfe. The outward rein, being croffed, not in a forward fenfe, but rather a little backwards, ferves alfo to prevent the outward fhoulder from getting too forwards, and makes it approach the inward one; which facilitates the inward leg's croffing over the outward one; which is the motion that fo admirably fupples the fhoulders. Care muft be taken, that the inward leg pafs over the outward one,

one, without touching it; this inward leg's crossing over must be helped also by the inward rein, which you must cross towards and over the outward rein every time the outward leg comes to the ground, in order to lift and help the inward leg over it: at any other time, but just when the outward leg comes to the ground, it would be wrong to cross the inward rein, or to attempt to lift up the inward leg by it; nay, it would be demanding an absolute impossibility, and lugging about the reins and horse to no purpose; because in this case, a very great part of the horse's weight resting then upon that leg, would render such an attempt, not only fruitless, but also prejudicial to the sensibility of the mouth, and probably oblige him to defend himself: and moreover, it would put the horse under a necessity of straddling before, and also of leading with the wrong leg, without being productive of any suppling motion whatsoever.

When the horse is thus far familiarly accustomed to what you have required of him, then proceed to effect by degrees the same crossing in his hinder legs. By bringing in the fore-legs more, you will of course engage the hinder ones in the same work: if they resist, the rider must bring both reins more inwards; and, if necessary, put back also, and approach his inward leg to the horse; and if the horse throws out his croup too far, the rider must bring both reins outwards, and if absolutely necessary, he must also make use of his outward leg, in order to replace the horse properly; observing that the croup should always be considerably behind the shoulders, which in all actions must go first; and the moment that the horse obeys, the rider must put his hand and leg again into their usual position.

Nothing is more ungraceful in itself, more detrimental to a man's seat, or more destructive of the sensibility of a horse's sides, than a continual wriggling unsettledness in a horseman's legs, which prevents the horse from ever going a moment together true, steady, or determined.

A horse should never be turned, without first moving a step forwards; and when it is doing, the rider must not lift up his elbow, and displace himself; a motion only of the hand from the one side to the other being sufficient for that purpose. It must also be a constant rule never to suffer a horse to be stopped, mounted or dismounted, but when he is well placed. The slower the motions are, when a man or horse is taught any thing, the better.

At first, the figures worked upon must be great, and afterwards made less by degrees, according to the improvement which the man and horse make: and the cadenced pace also, which they work in, must be accordingly augmented. The changes from one side to the other, must be in a bold determined trot, and at first quite straight forwards, without demanding any side motion on two *pistes*, which is very necessary to require afterwards, when the horse is sufficiently suppled. By two *pistes* is meant, when the fore-parts and hinder-parts do not follow, but describe two different lines.

In the beginning, a *longe* is useful on circles, and also on straight lines, to help both the rider and the horse; but afterwards when they are grown more intelligent, they should go alone. At the end of the lesson, rein back; and then put the horse, by a little at a time, forwards, by approaching both legs gently to his sides, and playing with the bridle: if he rears, push him out immediately into a full trot. Shaking the *cavesson* on the horse's nose, and also putting one's self before him and rather near to him, will generally make him back, though he otherwise refuse to do it: and moreover a slight use and approaching of the rider's legs, will sometimes be necessary in backing, in order to prevent the horse from doing it too much upon his shoulders; but the pressure of the legs ought to be very small, and taken quite away the moment that he puts himself enough upon his haunches. If the horse does not back upon a straight line properly, the rider must not be permitted to have recourse immediately to his leg, and so distort himself by it, but first try, if crossing over his hand and reins to which ever side may be necessary, will not be alone sufficient; which most frequently it will; if not, then employ the leg.

After a horse is well prepared and settled, and goes freely on in all his several paces, he ought to be in all his works kept, to a proper degree, upon his haunches, with his hinder legs well placed under him; whereby he will be always pleasant to himself and his rider, will be light in hand, and ready to execute whatever may be demanded of him, with facility, vigour, and quickness.

The common method that is used, of forcing a horse sideways, is a most glaring absurdity, and very hurtful to the animal in its consequences; for instead of suppling him, it obliges him to stiffen and defend himself, and often makes a creature, that is naturally benevolent, restive, frightened and vicious.

For horses, who have very long and high fore-hands, and who poke out their noses, a running snaffle is of excellent use; but for such as bore and keep their heads low, a common one is preferable; though any horse's head indeed may be kept up also with a running one, by the rider's keeping his hands very high and forwards: but whenever either is used alone without a briddle upon horses that carry their heads low and that bore, it must be sawed about from one side to the other.

This lesson of the *epaul en dedans*, should be taught to such people as are likely to become useful in helping to teach men and to break horses; and the more of such that can be found, the better: none others should ever be suffered upon any occasion to let their horses look any way besides the way they are going. But all horses whatever, as likewise all men, who are designed for the teaching others, must go thoroughly and perfectly through this excellent lesson, under the directions of intelligent instructors, and often practise it too afterwards, and when that is done, proceed to, and be finished by the lessons of the head and tail to the wall.

Of the head to the wall, and of the croup to the wall.

THIS lesson should be practised immediately after that of the *epaule en dedans*, in order to place the horse properly the way he goes, *&c.* The difference between the head to the wall, and the croup to the wall, consists in this; in the former, the fore parts are more remote from the centre, and go over more ground; in the latter, the hinder-parts are more remote from the center, and consequently

fequently go over more ground: in both, as likewife in all other leffons, the fhoulders muft go firft. In riding-houfes, the head to the wall is the eafier leffon of the two at firft, the line to be worked upon being marked by the wall, not far from his head.

The motion of the legs to the right, is the fame as that of the *epaule en dedans* to the left, and fo *vice verfa*; but the head is always bent and turned differently: in the *epaule en dedans*, the horfe looks the contrary way to that which he goes; in this he looks the way he is going.

In the beginning, very little bend muft be required; too much at once would aftonifh the horfe and make him defend himfelf: it is to be augmented by degrees. If the horfe abfolutely refufes to obey, it is a fign, that either he or his rider has not been fufficiently prepared by previous leffons. It may happen, that weaknefs or a hurt in fome part of the body, or fometimes temper, though feldom, may be the caufe of the horfe's defending himfelf: it is the rider's bufinefs to find out from whence the obftacle arifes; and if he finds it to be from the firft mentioned caufe, the previous leffons muft be refumed again for fome time; if from the fecond, proper remedies muft be applied; and if from the laft caufe, when all fair means that can be tried have failed, proper corrections with coolnefs and judgment muft be ufed.

In practifing this leffon to the right, bend the horfe to the right with the right rein; helping the left leg over the right (at the time when the right leg is juft come to the ground,) with the left rein croffed towards the right, and keeping the right fhoulder back with the right rein towards your body, in order to facilitate the left legs croffing over the right; and fo likewife *vice verfa* to the left, each rein helping the other by their properly mixed effects. In working to the right, the rider's left leg helps the hinder parts on to the right, and his right leg ftops them, if they get too forwards; and fo *vice verfa* to the left; but neither ought to be ufed, till the hand being employed in a proper manner has failed, or finds that a greater force is neceffary to bring what is required about than it can effect alone; for the legs fhould not only be correfponding with, but alfo fubfervient to the hand; and all unneceffary aids, as well as all force, ought always to be avoided, as much as poffible.

In the execution of all leffons, the equilibre of the rider's body is of great ufe to the horfe: it ought always to go with and accompany every motion of the animal; when to the right, to the right; and when to the left, to the left.

Upon all horfes, in every leffon and action, it muft be obferved, that there is no horfe but has his own peculiar appui or degree of bearing, and alfo a fenfibility of mouth, as likewife a rate of his own, which it is abfolutely neceffary for the rider to difcover and make himfelf acquainted with. A bad rider always takes off at leaft the delicacy of both, if not abfolutely deftroys it. The horfe will inform his rider when he has got his proper bearing in the mouth, by playing pleafantly and fteadily with his bit, and by the fpray about his chaps. A delicate and good hand will not only always preferve a light appui, or bearing, in its fenfibility; but alfo of a heavy one, whether naturally fo or acquired, make a light one. The lighter this appui can be made, the better; provided that the rider's hand correfponds with it; if it does not, the more the horfe is properly prepared, fo much the worfe. Inftances of this inconvenience of the beft of appuis, when the rider is not equally taught with the horfe, may be feen every day in fome gentlemen, who try to get their horfes bitted as they call it, without being fuitably prepared themfelves for riding them: the confequence of which is, that they ride in danger of breaking their necks; till at length after much hauling about, and by the joint infenfibility and ignorance of themfelves and their grooms, the poor animals gradually become mere fenfelefs, unfeeling pofts; and thereby grow, what they call, fettled. When the proper appui is found, and made of courfe as light as poffible, it muft not be kept duly fixed without any variation, but be played with; otherwife one equally continued tenfion of reins would render both the rider's hand and the horfe's mouth very dull. The flighteft, and frequent giving and taking, is therefore neceffary to keep both perfect.

Whatever pace or degree of quicknefs you work in, (be it ever fo faft, or ever fo flow,) it muft be cadenced; time is as neceffary for an horfeman as for a mufician.

This leffon of the head and of the tail to the wall, muft be taught every foldier: fcarce any manœuvre can be well performed without it. In clofing and opening of files, it is almoft every moment wanted.

The method of teaching horfes to ftand fire, noifes, alarms, fights, &c.

In order to make horfes ftand fire, the found of drums, and all forts of different noifes, you muft ufe them to it by degrees in the ftable at feeding-time; and inftead of being frightened at it, they will foon come to like it as a fignal for eating.

With regard to fuch horfes as are afraid of burning objects, begin by keeping them ftill at a certain diftance from fome lighted ftraw: carefs the horfe; and in proportion as his fright diminifhes, approach gradually the burning ftraw very gently, and increafe the fize of it. By this means he will very quickly be brought to be fo familiar with it, as to walk undaunted even through it.

As to horfes that are apt to lie down in the water, if animating them, and attacking them vigoroufly, fhould fail of the defired effect, then break a ftraw bottle full of water upon their heads, and let the water run into their ears, which is a thing they apprehend very much.

All troop-horfes muft be taught to ftand quiet and ftill when they are fhot off from, to ftop the moment you prefent, and not to move after firing, till they are required to do it; this leffon ought efpecially to be obferved in light-troops; in fhort, the horfes muft be taught to be fo cool and undifturbed, as to fuffer the rider to act upon him with the fame freedom as if he was on foot. Patience, coolnefs, and temper, are the only means requifite for accomplifhing this end. Begin by walking the horfe gently, then ftop and keep him from ftirring for fome time, fo as to accuftom him by degrees not to have the leaft idea of moving without orders: if he does, then back him;

and

and when you ſtop him, and he is quite ſtill, leave the reins quite looſe.

To uſe a horſe to fire-arms, firſt put a piſtol or carabine in the manger with his feed; then uſe him to the ſound of the lock and the pan; after which, when you are upon him, ſhew the piece to him, preſenting it forwards, ſometimes on one ſide, ſometimes on the other: when he is thus far reconciled, proceed to flaſh in the pan; after which, put a ſmall charge into the piece, and ſo continue augmenting it by degrees to the quantity which is commonly uſed: if he ſeems uneaſy, walk him forwards a few ſteps ſlowly; and then ſtop, back and careſs him. Horſes are often alſo diſquieted and unſteady at the claſh, and drawing, and returning of ſwords, all which they muſt be familiarized to by little and little, by frequency and gentleneſs.

It is very expedient for all cavalry in general, but particularly for light cavalry, that their horſes ſhould be very ready and expert in leaping over ditches, hedges, gates, *&c.* The leaps, of whatever ſort they are, which the horſes are brought to in the beginning, ought to be very ſmall ones; the riders muſt keep their bodies back, raiſe their hands a little in order to help the foreparts of the horſe up, and be very attentive to their equilibre. It is beſt to begin at a low bar covered with furze, which pricking the horſe's legs, if he does not raiſe himſelf ſufficiently, prevents his contracting a ſluggiſh and dangerous habit of touching, as he goes over, which any thing yielding and not pricking would give him a cuſtom of doing. Let the ditches you firſt bring horſes to, be narrow; and in this, as in every thing elſe, let the increaſe be made by degrees. Accuſtom them to come up to every thing which they are to leap over, and to ſtand coolly at it for ſome time; and then to raiſe themſelves gently up in order to form to themſelves an idea of the diſtance. When they leap well ſtanding, then uſe them to walk gently up to the leap, and to go over it without firſt halting at it; and after that practice is familiar to them, repeat the like in a gentle trot, and ſo by degrees faſter and faſter, till at length it is as familiar to them to leap flying on a full gallop, as any other way: all which is to be acquired with great facility by calm and ſoft means without any hurry.

As horſes are naturally apt to be frightened at the ſight and ſmell of dead horſes, it is adviſable to habituate them to walk over, and leap over carcaſſes of dead horſes: and as they are particularly terrified at this ſight, the greater gentleneſs ought conſequently to be uſed.

Horſes ſhould alſo be accuſtomed to ſwim, which often may be neceſſary upon ſervice; and if the men and horſes both are not uſed to it, both may be frequently liable to periſh in the water. A very ſmall portion of ſtrength is ſufficient to guide a horſe, any where indeed, but particularly in the water, where they muſt be permitted to have their heads, and be no ways conſtrained in any ſhape.

The unreaſonable rage in Britain of cutting off all extremities from horſes, is in all caſes a very pernicious cuſtom. It is particularly ſo in regard to a troop-horſe's tail. It is almoſt incredible, how much they ſuffer at the picket for want of it: conſtantly fretting, and ſweating, kicking about and laming one another, tormented, and ſtung off their meat, miſerable, and helpleſs; whilſt other horſes, with their tails on, bruſh off all flies, are cool and at their eaſe, and mend daily, whilſt the docked ones grow every hour more and more out of condition.

The method of reining back,—and of moving forwards immediately after,—of piaſing,—of pillars, &c.

Never finiſh your work by reining back with horſes that have any diſpoſition towards retaining themſelves; but always move them forwards and a little upon the haunches alſo after it, before you diſmount, (unleſs they retain themſelves very much indeed, in which caſe nothing at all muſt be demanded from the haunches.) This leſſon of reining back, and piafing, is excellent to conclude with, and puts an horſe well and properly on the haunches: It may be done, according as horſes are more or leſs ſuppled, either going forwards, backing, or in the ſame place: if it is done well advancing, or at moſt on the ſame ſpot, it is full ſufficient for a ſoldier's horſe: For to piafe in backing, is rather too much to be expected in the hurry, which cannot but attend ſuch numbers both of men and horſes as muſt be taught together in regiments. This leſſon muſt never be attempted at all, till horſes are very well ſuppled, and ſomewhat accuſtomed to be put together; otherwiſe it will have very bad conſequences, and create reſtiveneſs. If they refuſe to back, and ſtand motionleſs, the rider's legs muſt be approached with the greateſt gentleneſs to the horſe's ſides; at the ſame time as the hand is acting on the reins to ſolicite the the horſe's backing. This ſeldom fails of procuring the deſired effect, by raiſing one of the horſe's fore-legs, which being in the air, has no weight upon it, and is conſequently very eaſily brought backwards by a ſmall degree of tenſion in the reins. When this leſſon is well performed, it is very noble, and uſeful, and has a pleaſing air; it is an excellent one to begin teaching ſcholars with.

The leſſon is particularly ſerviceable in the pillars, for placing ſcholars well at firſt. Very few regimental riding-houſes have pillars, and it is fortunate they have not; for though, when properly made uſe of with ſkill, they are one of the greateſt and beſt diſcoveries in horſemanſhip; they muſt be allowed to be very dangerous and pernicious, when they are not under the direction of a very knowing perſon.

The method of curing reſtiveneſſes, vices, defences, ſtarting, &c.

Whenever a horſe makes reſiſtance, one ought, before a remedy or correction is thought of, to examine very minutely all the tackle about him, if any thing hurts or tickles him, whether he has any natural or accidental weakneſs, or in ſhort any the leaſt impediment in any part. For want of this precaution, many fatal diſaſters happen: the poor dumb animal is frequently accuſed falſely of being reſtive and vicious; is uſed ill without reaſon, and, being forced into deſpair, is in a manner obliged to act accordingly, be his temper and inclination ever ſo well

well disposed. It is very seldom the case, that a horse is really and by nature vicious; but if such be found, he will despise all caresses, and then chastisements become necessary.

Correction, according as you use it, throws a horse into more or less violent action, which, if he be weak, he cannot support: but a vitious strong horse is to be considered in a very different light, being able both to undergo and consequently to profit by all lessons; and is far preferable to the best-natured weak one upon earth. Patience and science are never-failing means to reclaim such a horse: in whatsoever manner he defends himself, bring him back frequently with gentleness (not however without having given him proper chastisement, if necessary,) to the lesson which he seems most averse to. Horses are by degrees made obedient, through the hope of recompence and the fear of punishment: how to mix these two motives judiciously together, is a very difficult matter; it requires much thought and practice; and not only a good head, but a good heart likewise. The coolest, and best natured rider, will always succeed best. By a dextrous use of the incitements above mentioned, you will gradually bring the horse to temper and obedience; mere force and want of skill and coolness, would only tend to confirm him in bad tricks. If he be impatient or choleric, never strike him, unless he absolutely refuses to go forwards; which you must resolutely oblige him to do, and which will be of itself a correction, by preventing his having time to meditate, and put in execution any defence by retaining himself. Resistance in horses, you must consider, is sometimes a mark of strength and vigour, and proceeds from spirits, as well as sometimes from vice and weakness. Weakness frequently drives horses into vitiousness, when any thing wherein strength is necessary is demanded from them; nay, it inevitably must: great care therefore should always be taken to distinguish from which of these two causes any remedy or punishment is thought of. It may sometimes be a bad sign, when horses do not at all defend themselves, and proceed from a sluggish disposition, a want of spirit, and of a proper sensibility. Whenever one is so fortunate as to meet with a horse of just the right spirit, activity, delicacy of feeling, with strength and good-nature, he cannot be cherished too much; for such a one is a rare and inestimable jewel, and, if properly treated, will in a manner do every thing of himself. Horses are oftener spoilt by having too much done to them, and by attempts to dress them in too great an hurry, than by any other treatment.

If after a horse has been well suppled, and there are no impediments, either natural or accidental, if he still persists to defend himself, chastisements then become necessary: but whenever this is the case, they must not be frequent, but always firm, though always as little violent as possible: for they are both dangerous and very prejudicial, when frequently or slightly played with; and still more so, when used too violently.

It is impossible, in general, to be too circumspect in lessons of all kinds, in aids, chastisements, or caresses. Some have quicker parts, and more cunning, than others. Many will imperceptibly gain a little every day on their rider. Various, in short, are their dispositions and capacities. It is the rider's business to find out their different qualities, and to make them sensible how much he loves them, and desires to be loved by them; but at the same time that he does not fear them, and will be master.

Plunging is a very common defence among restive and vitious horses: if they do it in the same place, or backing, they must, by the rider's legs and spurs firmly applied, be obliged to go forwards, and their heads kept up high. But if they do it flying forwards, keep them back, and ride them gently and very slow for a good while together. Of all bad tempers and qualities in horses, those which are occasioned by harsh treatment and ignorant riders, are the worst.

Rearing is a bad vice, and, in weak horses especially, a very dangerous one. Whilst the horse is up, the rider must yield his hand, and when the horse is descending, he must vigorously determine him forwards: if this be done at any other time but whilst the horse is coming down, it may add a spring to his rearing, and make him fall backwards. With a good hand on them, horses seldom persist in this vice; for they are themselves naturally much afraid of falling backwards. If this method fails, you must make the horse kick up behind, by getting somebody on foot to strike him behind with a whip; or, if that will not effect it, by pricking him with a goad.

Starting often proceeds from a defect in the sight; which therefore must be carefully looked into. Whatever the horse is afraid of, bring him up to it gently; if you caress him every step he advances, he will go quite up to it by degrees, and soon grow familiar with all sorts of objects. Nothing but great gentleness can correct this fault: for if you inflict punishment, the apprehension of chastisement becomes prevalent, and causes more starting than the fear of the object. If you let him go by the object, without bringing him up to it, you increase the fault, and confirm him in his fear: the consequence of which is, he takes his rider perhaps a quite contrary way from what he was going, becomes his master, and puts himself and the person upon him every moment in great danger.

With such horses as are to a very great degree fearful of any objects, make a quiet horse, by going before them, gradually entice them to approach nearer and nearer to the thing they are afraid of. If the horse, thus alarmed, be undisciplined and head-strong, he will probably run away with his rider; and if so, his head must be kept up high, and the snaffle sawed backwards and forwards from right to left, taking up and yielding the reins of it, as also the reins of the bit: but this latter must not be sawed backwards and forwards, like the snaffle, but only taken up, and yielded properly. No man ever yet did, or ever will stop a horse, or gain any one point over him, by main force, or by pulling a dead weight against him.

Remarks and hints on Shoeing.

As feet differ, so should shoes accordingly. The only system of farriers, is to shoe in general with excessive heavy and

and clumſy ill-ſhaped ſhoes, and very many nails, to the total deſtruction of the foot. The cramps they annex, tend to deſtroy the bullet; and the ſhoes made in the ſhape of a walnut-ſhell prevent the horſe's walking upon the firm baſis which God has given him for that end, and thereby oblige him to ſtumble and fall. They totally pare away alſo, and lay bare the inſide of the animal's foot with their deteſtable butteris, and afterwards put on very long ſhoes, whereby the foot is hindred from having any preſſure at all upon the heels, which preſſure otherwiſe might ſtill perchance, notwithſtanding their dreadful cutting, keep the heels properly open, and the foot in good order. The frog ſhould never be cut out; but as it will ſometimes become ragged, it muſt be cleaned every now and then, and the ragged pieces cut off with a knife. In one kind of foot indeed a conſiderable cutting away muſt be allowed of, but not of the frog; we mean that very high feet muſt be cut down to a proper height; becauſe if they were not, the frog, though not cut, would ſtill be ſo far above the ground, as not to have any bearing on it, whereby the great tendon muſt inevitably be damaged, and conſequently the horſe would go lame.

The weight of ſhoes muſt greatly depend on the quality and hardneſs of the iron. If the iron be very good, it will not bend; and in this caſe, the ſhoes cannot poſſibly be made too light: care however muſt be taken, that they be of a thickneſs ſo as not to bend; for bending would force out the nails, and ruin the hoof. That part of the ſhoe which is next the horſe's heel, muſt be narrower than any other, (as is ſeen in the draught, plate 101. fig. 4.) that ſtones may be thereby prevented from getting under it, and ſticking there; which otherwiſe would be the caſe; becauſe the iron, when it advances inwardly beyond the bearing of the foot, forms a cavity, wherein ſtones being lodged would remain, and, by preſſing againſt the foot, lame the horſe. The part of the ſhoe, which the horſe walks upon, ſhould be quite flat, and the inſide of it likewiſe; only juſt ſpace enough being left next the foot, to put in a picker, (which ought to be uſed every time the horſe comes into the ſtable,) and alſo to prevent the ſhoe's preſſing upon the ſole. Four nails on each ſide hold better than a gteater number, and keep the hoof in a far better ſtate. The toe of the horſe muſt be cut ſhort, and nearly ſquare, (the angles only juſt rounded off,) nor muſt any nails be driven there; this method prevents much ſtumbling, eſpecially in deſcents, and ſerves, by throwing nouriſhment to the heels, to ſtrengthen them; on them the horſe ſhould in ſome meaſure walk, and the ſhoe be made of a proper length accordingly; by this means, narrow heels are prevented, and many other good effects produced. Many people drive a nail at the toe, but it is an abſurd practice. Leaving room to drive one there cauſes the foot to be of an improper length; and moreover that part of the hoof is naturally ſo brittle, that even when it is kept well greaſed, the the nail there ſeldom ſtays in, but tears out and damages the hoof. That the directions for ſhoeing a proper length may be the more clear and intelligible, we have annexed (plate 101.) a draught of a foot ſhoed a proper length ſtanding on a plain ſurface, and with it a draught of the right kind of ſhoe.

In wet, ſpungy, and ſoft ground, where the foot ſinks in, the preſſure upon the heels is of courſe greater, than on hard ground; and ſo indeed it ſhould be upon all accounts. The hinder feet muſt be treated in the ſame manner as the fore-ones; and the ſhoes the ſame: except in hilly and ſlippery countries, they may not improperly be turned up a little behind: but turning up the fore-ſhoes is of no ſervice, and is certain ruin to the fore-legs, eſpecially to the bullets. In deſcending hills, cramps are apt to throw horſes down, by ſtopping the fore-legs, out of their proper baſis and natural bearing, when the hinder ones are rapidly preſſed; which unavoidably muſt be the caſe, and conſequently cannot but puſh the horſe upon his noſe. With them on a plain ſurface, a horſe's foot is always thrown forwards on the toe, out of its proper bearing, which is very liable to make the horſe ſtumble. The notion of their utility in going up hills is a falſe one. In aſcending, the toe is the firſt part of the foot, which bears on, takes hold of the ground, and whether the horſe draws or carries, and conſequently the buſineſs is done before the part where the cramps are comes to the ground. Ice-nails are preferable to any thing to prevent ſlipping, as alſo to help horſes up hill, the moſt forward ones taking hold of the ground early, conſiderably before the heels touch the ground: they muſt be ſo made, as to be, when driven in, ſcarce half inch above the ſhoe, and alſo have four ſides ending at the top in a point. They are of great ſervice to prevent ſlipping on all kinds of places, and by means of them a horſe is not thrown out of his proper baſis. They muſt be made of very good iron. If they are not, the heads of them will be perpetually breaking off. From the race-horſe to the cart-horſe, the ſame ſyſtem of ſhoeing ſhould be obſerved. The ſize, thickneſs, and weight of them only ſhould differ. The ſhoe of a race-horſe muſt of courſe be lighter than that of a ſaddle horſe; that of a ſaddle horſe lighter than that of a coach or bât horſe; and theſe laſt more ſo than a cart, waggon, or artillery horſe. At preſent all ſhoes in general are too *heavy*; if the iron is good, ſhoes need not be ſo thick as they are now generally made. The utmoſt ſeverity ought to be inflicted upon all thoſe who clap ſhoes on hot: This unpardonable lazineſs of farriers in making feet thus fit ſhoes, inſtead of ſhoes fitting feet, dries up the hoof, and utterly deſtroys them. Frequent removals of ſhoes are detrimental and tear the foot; but ſometimes they are very neceſſary: this is an inconvenience which half-ſhoes are liable to; for the end of the ſhoe, being very ſhort, is apt to work ſoon into the foot, and conſequently muſt then be moved.

For the *Natural Hiſtory* and *Treatment of the Diſeaſes* of *Horſes*, ſee EQUUS, and FARRIERY.

HORSHAM, a market-town and borough of Suſſex, ſituated twenty miles north weſt of Lewis, in W. long. 22', N. lat. 51° 10'. It ſends two members to parliament.

HORTAGILERS, in the grand feignior's court, upholfterers, or tapeftry-hangers. The grand feignior has conftantly four hundred in his retinue when he is in the camp: thefe go always a day's journey before him, to fix upon a proper place for his tent, which they prepare firft; and afterwards thofe of the officers, according to their rank.

HORTULANUS, in ornithology. See EMBERIZA.

HORTUS SICCUS, a DRY-GARDEN, an appellation given to a collection of fpecimens of plants, carefully dried and preferved.

Take a fpecimen of a plant in flower, and with it one of its bottom-leaves, if it have any; bruife the ftalk, if too rigid; flit it, if too thick; fpread out the leaves and flowers on paper; cover the whole with more paper, and lay a weight over all. At the end of eighteen hours take out the plants, now perfectly flatted; lay them on a bed of dry common fand; fift over them more dry fand, to the depth of two inches, and thus let them lie about three weeks: the lefs fucculent dry much fooner, but they take no harm afterwards. If the floor of a garret be covered in fpring with fand two inches deep, leaving fpace for walking to the feveral parts, it will receive the collection of a whole fummer, the covering of fand being fifted over every parcel as laid in. They need no farther care, from the time of laying them, till they are taken up to be ftuck on paper. The cement ufed is a folution of gum-arabic in water.

Plants may be dried very well without fand, by only putting them frequently into frefh quires of paper, or a few by only preffing them between the leaves of a book; but the fand-method preferves the colour beft, and is done with leaft trouble.

HOSANNA, a Hebrew word, fignifying *Save now*, or *Save, we befeech thee*; from the frequent ufe of which, during the feaft of tabernacles, the whole folemnity got the appellation of *Hofanna Rabbi*.

HOSEA, a canonical book of the Old Teftament, fo called from the prophet of that name, its author, who was the fon of Beri, and the firft of the leffer prophets. He lived in the kingdom of Samaria, and delivered his prophecies under the reign of Jeroboam II. and his fucceffors, kings of Ifrael; and under the reigns of Uzziah, Jotham, Ahaz, and Hezekiah, kings of Judah. His principal defign is to publifh the grofs idolatries of the people of Ifrael and Judah, to denounce the divine vengeance againft them, and to foretel the captivity in Affyria.

HOST, denotes either a perfon who entertains another, or the perfon fo entertained; but it is now generally ufed in the firft of thefe fenfes.

HOST, in the church of Rome, a name given to the elements ufed in the eucharift, or rather to the confecrated wafer; which they pretend to offer up every day, a new hoft or facrifice, for the fins of mankind.

They pay adoration to the hoft, upon a falfe prefumption that the elements are no longer bread and wine, but tranfubftantiated into the real body and blood of Chrift. See TRANSUBSTANTIATION.

HOSTAGE, a perfon given up to an enemy as a fecurity for the performance of the articles of a treaty.

HOT-BEDS, in gardening, beds made with frefh horfe-dung, or tanner's bark, and covered with glaffes to defend them from cold winds.

HOTTONIA, WATER-VIOLET, in botany, a genus of the pentandria monogynia clafs. The corolla is fhaped like a jug; the ftamina are fixed to the tube of the corolla; and the capfule has but one cell. There are two fpecies, none of them natives of Britain.

HOVINGHAM, a market-town of the eaft riding of Yorkfhire, feventeen miles north-eaft of York.

HOULSWORTHY, a market-town of Devonfhire, thirty-eight miles north-weft of Exeter.

HOUND. See CANIS.

HOUR, in chronology, an aliquot part of a natural day, ufually a 24th, fometimes a 12th. See ASTRONOMY, DIALING, GEOGRAPHY.

HOUSE, a habitation, or place built with conveniencies for dwelling in. See ARCHITECTURE.

HOUSE, in aftrology, denotes the twelfth part of the heavens.

HOUSTONIA, in botany, a genus of the tetrandria monogynia clafs. The corolla confifts of one bell-fhaped petal; and the feeds are two, and furrowed. There are two fpecies, none of them natives of Britain.

HOY, in naval architecture, a fmall veffel, fitted only with one maft.

HOYE, a town of Weftphalia, capital of a county of the fame name, and fubject to the elector of Hanover: E. long. 9°, N. lat. 53° 5′.

HUDSON'S BAY, a large mediterranean fea of north America, fituated between 51° and 63° of N. lat. and of unequal breath from 130 to 35 leagues.

HUDSON'S *ftreights*, giving entrance into Hudfon's bay, lie between 65° and 75° of W. lon.

HUDSON'S *river*, rifes near the lake Champlain, in Canada, and falls into the Atlantic, a little below the city of New-York.

HUE AND CRY, in law, the purfuit of a perfon who has committed felony on the highway.

HUEGLY, a large town in the Eaft Indies, fituated on an ifland in the moft wefterly branch of the river Ganges, in the province of Bengal: E. long. 87° N. lat. 23°.

HUETTE, a city of Spain, in the province of New Caftile, fixty-feven miles eaft of Madrid: W. lon. 2° 45′, N. lat. 40° 35′.

HUGUENOTS, a name given by way of contempt to the Calvinifts of France.

The name had its rife in the year 1560; but authors are not agreed as to its origin. The moft plaufible opinion, however, is that of Pafquier, who obferves, that at Tours, the place where they were firft thus denominated, the people had a notion, that an apparition or hobgoblin, called king Hugon, ftrolled about the ftreets in the night-time; from whence as thofe of the reformed religion met chiefly in the night to pray, *&c.* they called them Huguenots, that is, the difciples of king Hugon.

HULKS, large veffels ufed in fetting the mafts of fhips.

HULL, in the fea-language, is the main body of a fhip, without either mafts, yards, fails, or rigging. Thus to ftrike a hull in a ftorm is to take in her fails, and to lafh the helm on the lee-fide of the fhip; and to hull. or lie a-hull, is faid of a fhip whofe fails are thus taken in, and helm lafhed a lee.

HULL, in geography, a ftrong fea port town in the eaft riding of Yorkfhire, fituated on the river Hull, near the mouth of the Humber, thirty-two miles fouth-eaft of York.

HULPEN, a town of the Auftrian Netherlands, in the province of Brabant, fituated nine miles fouth eaft of Bruffels: E long. 4° 22′. N. lat. 50° 42′.

HUMAN, in general, is an appellation given to whatever relates to mankind: thus we fay, the human foul, human body, human laws, *&c.*

HUMANITY, the peculiar nature of man, whereby he is diftinguifhed from all other beings.

HUMANITIES, in the plural, fignify grammar, rhetoric, and poetry, known by the name of *literæ humaniores*; for teaching of which, there are profeffors in the univerfities of Scotland, called humanifts.

HUMBER, a river formed by the Trent, the Oufe and feveral other ftreams united. It divides Yorkfhire from Lincolnfhire, and falls into the German Sea at Holdernefs.

HUMBLE-BEE. See APIS.

HUMERUS, in anatomy. See ANAT. p. 176.

Luxation of the HUMERUS See SURGERY.

HUMIDITY, that quality in bodies whereby they are capable of wetting other bodies. This differs very much from fluidity, and feems to be merely a relative thing, depending upon the congruity of the component particles of the liquor to the pores of fuch particular bodies, as it is capable of adhering to, penetrating a little into, or wetting. Thus, for inftance, quickfilver is not a moift thing with regard to our hands or clothes, but may be called fo in reference to gold, tin, or lead, to whofe furfaces it will perfectly adhere, and render them foft and moift.

HUMMING-BIRD. See TROCHILUS.

HUMOUR, in a general fenfe, denotes much the fame with liquid or fluid. See FLUID.

HUMOUR. See WIT.

HUMULUS, in botany, a genus of the diœcia pentandria clafs. The calix of the male is divided into five parts, and it has no corolla. The calix of the female confifts of one entire leaf opening at one fide; the corolla is wanting; it has two ftyli; and the nut has two valves, and is inclofed within the calix. There is but one fpecies, *viz.* the lupulus, or hop, a native of Britain. See HOP.

HUNDRED, *hundredum*, or *centuria*, a part or divifion of a county, which was anciently fo called from its containing an hundred families, or from its furnifhing an hundred able men for the king's wars. After king Alfred's dividing this kingdom into counties, and giving the government of each county to a fheriff, thefe counties were divided into hundreds, of which the conftable was the chief officer. The grants of hundreds were at firft made by the king to particular perfons but they are not now held by grant or prefcription; their jurifdiction being devolved to the county-court; a few of them only excepted, that have been by privilege annexed to the crown, or granted to fome great fubjects, and ftill remain in the nature of a franchife.

HUNGARY, a kingdom bounded by the Carpathian mountains, which divide it from Poland, on the north; by Tranfilvania and Walachia on the eaft; by the river Drave, which feparates it from Sclavonia, on the fouth; and by Auftria and Moravia on the weft. It is one continued plain of 300 miles long, and is fituated between 16° and 23° of E lon. and between 45° and 49° of N. lat. It is now fubject to the emprefs queen.

HUNGARY WATER, a diftilled-water, fo denominated from a queen of Hungary, for whofe ufe it was firft prepared.

Quincy gives the following directions for making it. Take of frefh gathered flowers of rofemary, two pounds; rectified fpirits of wine, two quarts; put them together, and diftil them immediately in balneo.

Or, Take of frefh tops of rofemary, one pound and a half; proof fpirit, one gallon; and diftil in balneo till five pints are obtained.

HUNGER, an uneafy fenfation, which creates an appetite or defire of food.

Hunger is by fome attributed to a fharp acrimonious humour, which vellicates the coats of the ftomach; others, who deny the exiftence of any fuch liquor, attribute it to the attrition or rubbing of the coats of the ftomach; and others, again, account for it from the acidity of the blood.

HUNGERFORD, a market-town of Berkfhire, fituated on the river Kennet, twenty-four miles weft of Reading.

HUNNINGHEN, a town of Germany, in the langraviate of Alface, fituated on the Rhine, three miles north of Bafil: E long. 7° 35′, N. lat. 47° 37′.

HUNNOBY, a market-town in the eaft riding of Yorkfhire, fituated thirty four miles north eaft of York.

HUNTING the exercife or diverfion of purfuing four-footed beafts of game.

Four-footed beafts are hunted in the fields, woods, and thickets, and that both with guns and greyhounds.

Birds, on the contrary, are either fhot in the air, or taken with nets and other devices, which exercife is called fowling; or they are purfued and taken by birds of prey, which is called hawking.

The purfuing of four-footed beafts, as badgers, deer, does, roebucks, foxes, hares, *&c.* properly termed hunting, is a noble exercife, ferving not only to recreate the mind, but to ftrengthen the body, whet the ftomach, and chear the fpirits.

HUNTINGDON, the capital of Huntingdonfhire, fituated on the river Oufe, fifty-fix miles north of London: W. lon. 15′, and N. lat 52° 23′.

It fends two members to parliament.

HUQUAM, a province of China, bounded by Honan on

on the north, and by Quamſi and Canton on the ſouth; lying between 25° and 30° of north latitude.

HURA, the SAND BOX TREE, in botany, a genus of the monoecia monadelphia claſs. The male has no calix; the corolla conſiſts of four petals; it has eight ſtamina, and four glandular bearded nectaria; the calix and corolla of the female are the ſame as in the male; the ſtylus is filiform; the ſtigma is peltated; the capſule has four valves, and but one ſeed. There is only one ſpecies, a native of Mexico.

HURDLES, in fortification, twigs of willows or oſiers interwoven cloſe together, ſuſtained by long ſtakes, and uſually laden with earth.

HURDLES, in huſbandry, certain frames, made either of ſplit timber, or of hazel-rods, watled together, to ſerve for gates in incloſures, or to make ſheep-folds, *&c.*

HURDS, or HORDS, *of flax*, or *hemp*, the coarſer parts ſeparated in the dreſſings from the tear or fine ſtuff. See FLAX.

HURLE BONE, in a horſe, a bone near the middle of the buttock, very apt to go out of its ſockets with a hurt or ſtrain.

HURON, a vaſt lake of North America, ſituated between 84° and 89° W. long. and between 43° and 46° N lat. from whence the country contiguous to it is called the country of the Hurons, whoſe language is ſpoken over a great extent in the ſouthern parts of north America.

HURRICANE, a furious ſtorm of wind, owing to a contrariety of winds. See WIND and WHIRLWIND.

Hurricanes are frequent in the Weſt-indies, where they make terrible ravages, by rooting up trees, deſtroying houſes and ſhipping, and the like.

HUSBAND, a man joined or contracted with a woman in marriage.

HUSBANDRY. See AGRICULTURE.

HUSK, the ſame with what botaniſts call the calix, or cup of a flower. See BOTANY, p. 636, *&c.*

HUSO in ichthyology. See ACCIPENSER.

HUSSARS, a kind of irregular cavalry armed with the ſabre and bayonet, are retained in the ſervice of moſt princes or the continent.

They are very reſolute partiſans, and better in an invaſion or haſty expedition than in a ſet battle.

HUSSITES, the diſciples of John Huſs, a Bohemian, and curate of the chapel of Bethlehem at Prague; who, about the year 1414, embraced and defended the opinions of Wickliff of England, for which he was cited before the council of Conſtance, and, refuſing to renounce his ſuppoſed errors. he was condemned to be burnt alive, which ſentence was accordingly executed upon him at Conſtance.

It is evident in what the pretended hereſy of John Huſs and Jerom of Prague, who ſuffered with him, conſiſted, from the anſwer they made to the council, when they were admoniſhed to conform to the ſentiments of the church: They were lovers, they ſaid, of the holy goſpel, and true diſciples of Chriſt; that the church of Rome, and all other churches of the world, were widely departed from the apoſtolical tradition; that the clergy ran after pleaſures and riches, lorded it over the people, affected the higheſt ſeats at entertainments, bred horſes and dogs; and the revenues of the church, which belonged to the poor members of Chriſt, were conſumed in vanity and wantonneſs; and that the prieſts were ignorant of the commandments of God, or, if they did know them, paid but little regard to them. The followers of Huſs were alſo called Calixtins, Taberites, and Bohemian brethren.

HUSTINGS, a court held in Guildhall before the lord-mayor and aldermen of London, and reckoned the ſupreme court of the city. Here deeds may be inrolled, recoveries paſſed, out-lawries ſued out, and replevins and writs of error determined. In this court alſo is the election of aldermen, of the four members of parliament for the city, *&c.*

This court is very ancient, as appears by the laws of Edward the Confeſſor.

Some other cities have likewiſe had a court bearing the ſame name, as Wincheſter, York, *&c.*

HUSUM, a port-town of Sleſwic or ſouth Jutland, ſituated on the German ſea; ſubject to the duke of Holſtein Gottorp: E. long. 8° 30′, N. lat. 54° 40.

HUTHERFIELD, a market-town in the weſt riding of Yorkſhire: W. long. 1° 34′, N. lat. 53° 37′.

HUY, a ſtrong town in the biſhopric of Liege, ſituated on the Maes, ſixteen miles north-eaſt of Namur: E. long. 5° 15, N. lat. 50° 35′.

HYACINTH, in botany. See HYACINTHUS.

HYACINTH, in natural hiſtory, a genus of pellucid gems, whoſe colour is red with an admixture of yellow.

The hyacinth, though leſs ſtriking to the eye than any other red gems, is not without its beauty in the fineſt ſpecimens. It is found of various ſizes, from that of a pin's head to the third of an inch in diameter. Like common cryſtal, it is ſometimes found columnar, and ſometimes in a pebble-form; and is always hardeſt and brighteſt in the larger maſſes.

Its colour is a dull or deadiſh red, with an admixture of yellow in it; and this mixed colour is found in all the variety of tints that a prevalence of the red or of the yellow in different degrees is capable of giving it.

Our jewelers allow all thoſe gems to be hyacinths or jacinths, that are of a due hardneſs with this mixed colour; and as they are of very different beauty and value in their ſeveral degrees and mixture of colours, they divide them into four kinds; three of which they call hyacinths, but the fourth, very improperly, a ruby. 1. When the ſtone is in its moſt perfect ſtate, and of a pure and bright flame-colour, neither the red nor the yellow prevailing, in this ſtate they call it hyacintha la belle. 2. When it has an over proportion of the red, and that of a duſkier colour than the fine high red in the former, and the yellow that appears in a faint degree in it is not a fine, bright, and clear, but a duſky browniſh-yellow, then they call it the ſaffron hyacinth. 3. Such ſtones as are of a dead whitiſh-yellow, with a very ſmall proportion of red in them, they call amber-hyacinths. And, 4. When the

the ſtone is of a fine deep red, blended with a duſky and very deep yellow, they call it a rubacelle. But though the over-proportion of a ſtrong red in this gem has made people refer it to the claſs of rubies, its evident mixture of yellow ſhews that it truly belongs to the hyacinths.

The hyacinth la belle is found both in the Eaſt and Weſt Indies. The oriental are the harder, but the American are often equal to them in colour. The rubacelle is found only in the Eaſt Indies, and is generally brought over among the rubies, but it is of little value: the other varieties are found in Sileſia and Bohemia.

HYACINTHUS, in botany, a genus of the hexandria monogynia claſs. The corolla is bell ſhaped; and there are three melliferous pores in the germen. There are 13 ſpecies, only one of which, *viz.* the non-ſcriptus, Engliſh hyacinth, or hare bells, is a native of Britain.

HYADES, in aſtronomy, ſeven ſtars in the bull's head, famous among the poets for the bringing of rain. See ASTRONOMY, p. 487.

HYATIDES, in medicine, little tranſparent veſicles or bladders, full of water, ſometimes found ſolitary, and ſometimes in cluſters, upon the liver, and various other parts, eſpecially in hydropical conſtitutions.

HYDATOSCOPIA, called alſo hydromancy, a kind of divination or method of foretelling future events by means of water.

HYDNUM, in botany, a genus of the cryptogamia fungi claſs: it is an horizontal fungus, echinated or beſet with ſharp-pointed fibres on its under part. There are four ſpecies, only one of which, *viz.* the imbricatum, or common hydnum, is a native of Britain.

HYDRA, in aſtronomy. See ASTRONOMY, p. 487.

HYDRAGOGUES, among phyſicians, remedies which evacuate a large quantity of water in dropſies.

Quincy obſerves, that the ſtrongeſt cathartics chiefly anſwer to the character of hydragogues, in that by their forcibly ſhaking and vellicating the bowels and their appendages, they ſqueeze out water enough to make the ſtools appear little elſe.

The principal hydragogues, in the common opinion, are the juices of elder, of the root of iris, of ſoldanella, mechoacan, jalop, *&c.*

HYDRANGÆA, in botany, a genus of the decandria digynia claſs. The capſule has two cells, and a double beak. There is but one ſpecies, a native of Virginia.

HYDRAULICS, the ſcience of the motion of fluids, and the conſtruction of all kinds of inſtruments and machines relating thereto.

As the conſtruction of hydraulic engines depends upon the knowledge of the general laws of fluids, it will be better to give the deſcription of them under the article hydroſtatics. See HYDROSTATICS.

HYDRENTEROCELE, in ſurgery, a ſpecies of hernia, wherein the inteſtines deſcend into the ſcrotum, together with a quantity of water.

HYDROCELE, in ſurgery, denotes any hernia ariſing from water; but is particularly uſed for ſuch a one of the ſcrotum which ſometimes grows to the ſize of one's head, without pain, but exceeding troubleſome to the patient. See SURGERY.

HYDROCEPHALUS, in ſurgery, a preternatural diſtention of the head, to an uncommon ſize, by a ſtagnation and extravaſation of the lymph, which, when collected within ſide of the bones of the cranium, the hydrocephalus is then termed internal; as it is external, when retained betwixt the common integuments and the cranium. See SURGERY.

HYDROCHARIS, the LITTLE WATER-LILY, in botany, a genus of the diœcia decandria claſs. The ſpatha of the male conſiſts of two leaves, the calix of three ſegments, and the corolla of three petals. The calix of the female conſiſts of three ſegments, and the corolla of three petals; it has ſix ſtyli; and the capſule has ſix cells and many ſeeds. There is but one ſpecies, *viz.* the morſus ranæ, or frog bit, a native of Britain.

HYDROCORAX, in ornithology. See BUCEROS.

HYDROCOTYLE, in botany, a genus of the pentandria digynia claſs. The umbella is ſimple; the involucrum conſiſts of four leaves; the petals are entire, and the ſeeds are roundiſh and compreſſed. There are five ſpecies, only one of them, *viz.* the vulgaris, march penny wort, or white rot, is a native of Britain.

HYDROGRAPHY, the art of meaſuring and deſcribing the ſea, rivers, lakes, and canals.

With regard to the ſea, it gives an account of its tides, counter-tides, ſoundings, bays, gulphs, creeks, *&c.* as alſo of the rocks, ſhelves, ſands, ſhallows, promontories, harbours, the diſtance and bearing of one port from another, with every thing that is remarkable, whether out at ſea, or on the coaſt.

HYDROMANCY, a method of divination by water, practiſed by the ancients in this manner. They filled a cup or bowl of water: then faſtening a ring to a piece of thread tied to their finger, held it over the water, and repeated a certain form of words, deſiring to be ſatisfied with regard to their inquiry; and if the queſtion was anſwered in the affirmative, the ring would ſtrike the ſides of the bowl of its own accord.

Another kind of hydromancy was to look upon the water in which the figure of ſeveral dæmons uſed to appear. This expedient Numa is ſaid to have made uſe of, to ſettle the ceremonies of religion.

This way of divination is ſaid to have been uſed firſt by the Perſians, and afterwards approved by Pythagoras.

HYDROMEL, among phyſicians, water empregnated with honey, either before or after fermentation.

Vinous hydromel, commonly called mead, is ſaid to be good for the gravel. See the article MEAD.

HYDROMETER, an inſtrument to meaſure the gravity, denſity, velocity, force, *&c.* of water and other fluids. See HYDROSTATICS.

HYDROPHACE, in botany. See LEMNA.

HYDROMPHALUS, in medicine and ſurgery, a tumour in the navel, ariſing from a collection of water.

HYDROPHANÆ, in natural hiſtory, a genus of ſemi-pellucid gems, compoſed of cryſtal and earth; the latter ingredient being in large proportion, and mixed imperfectly,

imperfectly, as in the chalcedony; and giving a general cloudiness or mistiness to the stone, but of so imperfect and irregular an admixture, as not to be capable of so good a polish as the chalcedony; and appearing of a dusky and foul surface, till thrown into water, in which they become lucid, and in some degree transparent, either in part or totally; also changing their colour, which returns to them on being taken out of the water.

To this genus belong the oculus beli of authors, or whitish-grey hydrophanes, variegated with yellow, and with a black central nucleus; and the oculus mundi, or lapis mutabilis, which is likewise a whitish-grey kind without veins.

HYDROPHOBIA, an aversion or dread of water; a terrible symptom of the rabies canina. See MEDICINE.

HYDROPHYLLUM, in botany, a genus of the pentandria monogynia class. The corolla is bell-shaped; the stigma is bifid; and the capsule is roundish with two valves. There are two species, none of them natives of Britain.

HYDROPS, in medicine. See MEDICINE.

HYDROSCOPE, an instrument anciently used for the measuring of time.

The hydroscope was a kind of water-clock, consisting of a cylindrical tub, conical at bottom: the cylinder was graduated, or marked out with divisions, to which the top of the water becoming successively contiguous, as it trickled out at the vertex of the cone, pointed out the hour.

HYDROSTATICS.

THE science of HYDROSTATICS treats of the nature gravity, pressure, and motion of fluids in general; and of weighing solids in them.

A fluid is a body that yields to the least pressure or difference of pressures. Its particles are so exceedingly small, that they cannot be discerned by the best of microscopes; they are hard, since no fluid, except air or steam, can be pressed into a less space than it naturally possesses; and they are round and smooth, since they are so easily moved among one another.

All bodies, both fluid and solid, press downwards by the force of gravity: but fluids have this wonderful property, that their pressure upwards and sidewise is equal to their pressure downwards; and this is always in proportion to their perpendicular height, without any regard to their quantity: for, as each particle is quite free to move, it will move towards that part or side on which the pressure is least. And hence, no particle or quantity of a fluid can be at rest, till it is every way equally pressed.

(Plate XCIX. fig. 2.) To shew by experiment that fluids press upward as well as downward, let AB be a long upright tube filled with water near to its top; and CD a small tube open at both ends, and immersed into the water in the large one: if the immersion be quick, you will see the water rise in the small tube to the same height that it stands in the great one, or until the surfaces of the water in both are on the same level: which shews that the water is pressed upward into the small tube by the weight of what is in the great one; otherwise it could never rise therein. contrary to its natural gravity; unless the diameter of the bore were so small, that the attraction of the tube would raise the water; which will never happen, if the tube be as wide as that in a common barometer. And as the water rises no higher in the small tube than till its surface be on a level with the surface of the water in the great one, this shews that the pressure is not in proportion to the quantity of water in the great tube, but in proportion to its perpendicular height therein: for there is much more water in the great tube all around the small one, than what is raised to the same height in the small one, as it stands in the great.

Take out the small tube, and let the water run out of it; then it will be filled with air. Stop its upper end with the cork C, and it will be full of air all below the cork: this done, plunge it again to the bottom of the water in the great tube, and you will see the water rise up in it to the height E; which shews that the air is a body, otherwise it could not hinder the water from rising up to the same height as it did before, namely, to A; and in so doing. it drove the air out at the top; but now the air is confined by the cork C: and it also shews that the air is a compressible body; for if it were not so, a drop of water could not enter into the tube.

The pressure of fluids being equal in all directions, it follows, that the sides of a vessel are as much pressed by a fluid in it, all around in any given ring of points, as the fluid below that ring is pressed by the weight of all that stands above it. Hence the pressure upon every point in the sides, immediately above the bottom, is equal to the pressure upon every point of the bottom. To shew this by experiment, let a hole be made at E (fig. 3.) in the side of the tube AB close by the bottom; and another hole of the same size in the bottom, at C; then pour water into the tube, keeping it full as long as you chuse the holes should run, and have two two basons ready to receive the water that runs through the two holes, until you think there is enough in each bason; and you will find, by measuring the quantities, that they are equal; which shews that the water run with equal speed through both holes; which it could not have done, if it had not been equally pressed through them both: for if a hole of the same size be made in the side of the tube, as about *f*, and if all three are permitted to run together, you will find that the quantity run through the hole at *f* is much less than what has run in the same time through either of the holes C or *e*.

A. Bell Sculp.

In the ſame figure, let the tube be re-curved from the bottom at C into the ſhape DE, and the hole at C be ſtopt with a cork. Then pour water into the tube to any height, as *Ag*, and it will ſpout up in a jet EFG, nearly as high as it is kept in the tube AB, by continuing to pour in as much there as runs through the hole E; which will be the caſe whilſt the ſurface *Ag* keeps at the ſame height. And if a little ball of cork G be laid upon the top of the jet, it will be ſupported thereby, and dance upon it. The reaſon why the jet riſes not quite ſo high as the ſurface of the water *Ag*, is owing to the reſiſtance it meets with in the open air: for if a tube, either great or ſmall, was ſcrewed upon the pipe at E, the water would riſe in it until the ſurfaces of the water in both tubes were on the ſame level; as will be ſhewn by the next experiment.

The hydroſtatic paradox.

Any quantity of a fluid, how ſmall ſoever, may be made to balance and ſupport any quantity, how great ſoever. This is deſervedly termed *the hydroſtatical paradox*, which we ſhall firſt ſhew by an experiment, and then account for it upon the principle above-mentioned, namely, that *the preſſure of fluids is directly as their perpendicular height, without any regard to their quantity.*

Let a ſmall glaſs tube DCG, (fig. 4.) open at both ends, and bended at B, be joined to the end of a great one AI at *cd*, where the great one is alſo open; ſo that theſe tubes in their openings may freely communicate with each other. Then pour water through a ſmall-necked funnel into the ſmall tube at H; this water will run through the joining of the tubes at *cd*, and riſe up into the great tube: and if you continue pouring until the ſurface of the water comes to any part, as A, in the great tube, and then leave off, you will ſee that the ſurface of the water in the ſmall tube will be juſt as high at D; ſo that the perpendicular altitude of the water will be the ſame in both tubes, however ſmall the one be in proportion to the other. This ſhews, that the ſmall column DCG balances and ſupports the great column A*cd*; which it could not do if their preſſures were not equal againſt one another in the recurved bottom at B.—If the ſmall tube be made longer, and inclined in the ſituation GEF, the ſurface of the water in it will ſtand at F, on the ſame level with the ſurface A in the great tube; that is, the water will have the ſame perpendicular height in both tubes, although the column in the ſmall tube is longer than that in the great one; the former being oblique, and the latter perpendicular.

Since then the preſſure of fluids is directly as their perpendicular heights, without any regard to their quantities, it appears that whatever the figure or ſize of veſſels be, if they are of equal heights, and if the areas of their bottoms are equal, the preſſures of equal heights of water are equal upon the bottoms of theſe veſſels; even though the one ſhould hold a thouſand or ten thouſand times as much water as would fill the other. To confirm this part of the hydroſtatical paradox by an experiment, let two veſſels be prepared of equal heights, but very unequal contents, ſuch as AB in fig. 5. and AB in fig. 6. Let each veſſel be open at both ends, and their bottoms D*d* D*d* be of equal widths. Let a braſs bottom CC be exactly fitted to each veſſel, not to go into it, but for it to ſtand upon; and let a piece of wet leather be put between each veſſel and its braſs bottom, for the ſake of cloſeneſs. Join each bottom to its veſſel by a hinge D, ſo that it may open like the lid of a box; and let each bottom be kept up to its veſſel by equal weights E and E, hung to lines which go over the pulleys F and F (whoſe blocks are fixed to the ſides of the veſſels at *f*) and the lines tied to hooks at *d* and *d*, fixed in the braſs bottoms oppoſite to the hinges D and D. Things being thus prepared and fitted, hold the veſſel AB (fig. 5.) upright in your hands over a baſon on a table, and cauſe water to be poured into the veſſel ſlowly, till the preſſure of the water bears down its bottom at the ſide *d*, and raiſes the weight E; and then part of the water will run out at *d*. Mark the height at which the ſurface H of the water ſtood in the veſſel, when the bottom began to give way at *d*; and then, holding up the other veſſel AB (fig. 4.) in the ſame manner, cauſe water to be poured into it at H; and you will ſee that when the water riſes to A in this veſſel, juſt as high as it did in the former, its bottom will alſo give way at *d*, and it will loſe part of the water.

The natural reaſon of this ſurpriſing phenomenon is, that ſince all parts of a fluid at equal depths below the ſurface are equally preſſed in all manner of directions, the water immediately below the fixed part B*f* (fig. 4.) will be preſſed as much upward againſt its lower ſurface within the veſſel, by the action of the column A*g*, as it would be by a column of the ſame height, and of any diameter whatever; (as was evident by the experiment with the tube, fig. 3.) and therefore, ſince action and reaction are equal and contrary to each other, the water immediately below the ſurface B*f* will be preſſed as much downward by it, as if it was immediately touched and preſſed by a column of the height *g*A, and of the diameter B*f*: and therefore, the water in the cavity BD*df* will be preſſed as much downward upon its bottom CC, as the bottom of the other veſſel (fig. 5.) is preſſed by all the water above it.

To illuſtrate this a little farther, let a hole be made at *f* (fig. 5.) in the fixed top B*f*, and let a tube G be put into it; then, if water be poured into the tube A, it will (after filling the cavity B*d*) riſe up into the tube G, until it comes to a level with that in the tube A; which is manifeſtly owing to the preſſure of the water in the tube A, upon that in the cavity of the veſſel below it. Conſequently, that part of the top B*f*, in which the hole is now made, would, if corked up, be preſſed upward with a force equal to the weight of all the water which is ſupported in the tube G: and the ſame thing would hold at *g*, if a hole were made there. And ſo if the whole cover or top B*f* were full of holes, and had tubes as high as the middle one A*g* put into them, the water in each tube would riſe to the ſame height as it is kept into the tube A, by pouring more into it, to make up the deficiency that it ſuſtains by ſupplying the others, until they were all full: and then the water in the tube A would ſupport equal heights of water in all the reſt of the

the tubes, Or, if all the tubes except A, or any other one, were taken away, and a large tube equal in diameter to the whole top B*f* were placed upon it, and cemented to it; and then if water were poured into the tube that was left in either of the holes, it would aſcend through all the reſt of the holes, until it filled the large tube to the ſame height that it ſtands in the ſmall one, after a ſufficient quantity had been poured into it: which ſhews, that the top B*f* was preſſed upward by the water under it, and before any hole was made in it, with a force equal to that wherewith it is now preſſed downward by the weight of all the water above it in the great tube. And therefore, the reaction of the fixed top B*f* muſt be as great, in preſſing the water downward upon the bottom CC, as the whole preſſure of the water in the great tube would have been, if the top had been taken away, and the water in that tube left to preſs directly upon the water in the cavity BD*df*.

The hydroſtatic bellows.

Perhaps the beſt machine in the world for demonſtrating the upward preſſure of fluids, is the hydroſtatic bellows A (fig. 7.) which conſiſts of two thick oval boards, each about 16 inches broad, and 18 inches long, covered with leather, to open and ſhut like a common bellows, but without valves; only a pipe B, about three feet high, is fixed into the bellows at *e*. Let ſome water be poured into the pipe at *c*, which will run into the bellows, and ſeparate the boards a little. Then lay three weights *b*, *c*, *d*, each weighing 100 pounds, upon the upper board; and pour more water into the pipe B, which will run into the bellows, and raiſe up the board with all the weights upon it; and if the pipe be kept full, until the weights are raiſed as high as the leather which covers the bellows will allow them, the water will remain in the pipe, and ſupport all the weights, even though it ſhould weigh no more than a quarter of a pound, and they 300 pounds: nor will all their force be able to cauſe them to deſcend and force the water out at the top of the pipe.

The reaſon of this will be made evident, by conſidering what has been already ſaid of the reſult of the preſſure of fluids of equal heights without any regard to their quantity. For, if a hole be made in the upper board, and a tube be put into it, the water will riſe in the tube to the ſame height that it does in the pipe; and would riſe as high (by ſupplying the pipe) in as many tubes as the board could contain holes. Now, ſuppoſe only one hole to be made in any part of the board, of an equal diameter with the bore of the pipe B; and that the pipe holds juſt a quarter of a pound of water; if a perſon claps his finger upon the hole, and the pipe be filled with water, he will find his finger to be preſſed upward with a force equal to a quarter of a pound. And as the ſame preſſure is equal upon all equal parts of the board, each part, whoſe area is equal to the area of the whole, will be preſſed upward with a force equal to that of a quarter of a pound: the ſum of all which preſſures againſt the under ſide of an oval board 16 inches broad, and 18 inches long, will amount to 300 pounds; and therefore ſo much weight will be raiſed up and ſupported by a quarter of a pound of water in the pipe.

Hence, if a man ſtands upon the upper board, and blows into the bellows through the pipe B, he will raiſe himſelf upward upon the board: and the ſmaller the bore of the pipe is, the eaſier he will be able to raiſe himſelf. And then, by clapping his finger upon the top of the pipe, he can ſupport himſelf as long as he pleaſes; provided the bellows be air-tight, ſo as not to loſe what is blown into it.

Upon this principle of the upward preſſure of fluids, a piece of lead may be made to ſwim in water, by immerſing it to a proper depth, and keeping the water from getting above it. Let CD (fig. 8.) be a glaſs tube, open at both ends, and EFG a flat piece of lead, exactly fitted to the lower end of the tube, not to go within it, but for it to ſtand upon; with a wet leather between the lead and tube to make cloſe work. Let this leaden bottom be half an inch thick, and held cloſe to the tube by pulling the packthread IHL upward at L with one hand, whilſt the tube is held in the other by the upper end C. In this ſituation, let the tube be immerſed in water in the glaſs veſſel AB, to the depth of ſix inches below the ſurface of the water at K; and then, the leaden bottom EFG will be plunged to the depth of ſomewhat more than eleven times its own thickneſs: holding the tube at that depth, you may let go the thread at L; and the lead will not fall from the tube, but will be kept to it by the upward preſſure of the water below it, occaſioned by the height of the water at K above the level of the lead. For as lead is 11.33 times as heavy as its bulk of water, and is in this experiment immerſed to a depth ſomewhat more than 11.33 times its thickneſs, and no water getting into the tube between it and the lead, the column of water E*abc*G below the lead is preſſed upward againſt it by the water KDEGL all around the tube; which water being a little more than 11.33 times as high as the lead is thick, is ſufficient to balance and ſupport the lead at the depth KE. If a little water be poured into the tube upon the lead, it will increaſe the weight upon the column of water under the lead, and cauſe the lead to fall from the tube to the bottom of the glaſs veſſel, where it will lie in the ſituation *bd*. Or, if the tube be raiſed a little in the water, the lead will fall by its own weight, which will then be too great for the preſſure of the water around the tube upon the column of water below it.

Let two pieces of wood be plained quite flat, ſo as no water may get in between them when they are put together: let one of the pieces, as *bd*, be cemented to the bottom of the veſſel AB (fig. 8.) and the other piece be laid flat and cloſe upon it, and held down to it by a ſtick, whilſt water is poured into the veſſel; then remove the ſtick, and the upper piece of wood will not riſe from the lower one: for, as the upper one is preſſed down both by its own weight and the weight of all the water over it, whilſt the contrary preſſure of the water is kept off by the wood under it, it will lie as ſtill as a ſtone would do in its place. But if it be raiſed ever ſo little at any edge, ſome water will then get under it; which being acted upon by the water above, will immediately preſs it upward; and as it is lighter than its bulk of water, it will riſe, and float upon the ſurface of the water.

All fluids weigh juſt as much in their own element as they

they do in open air. To prove this by experiment, let as much ſhot be put into a phial, as, when corked, will make it ſink in water: and being thus charged, let it be weighed, firſt in air, and then in water, and the weights in both both caſes wrote down. Then, as the phial hangs ſuſpended in water, and counterpoiſed, pull out the cork, that water may run into it, and it will deſcend, and pull down that end of the beam. This done, put as much weight into the oppoſite ſcale as will reſtore the equipoiſe; which weight will be found to anſwer exactly to the additional weight of the phial when it is again weighed in air, with the water in it.

The velocity with which water ſpouts out at a hole in the ſide or bottom of a veſſel, is as the ſquare root of the depth or diſtance of the hole below the ſurface of the water. For, in order to make double the quantity of a fluid run through one hole as through another of the ſame ſize, it will require four times the preſſure of the other, and therefore muſt be four times the depth of the other below the ſurface of the water: and for the ſame reaſon, three times the quantity running in an equal time through the ſame ſort of hole, muſt run with three times the velocity, which will require nine times the preſſure; and conſequently muſt be nine times as deep below the ſurface of the fluid: and ſo on.—To prove this by an experiment, let two pipes, as C and *g* (fig. 9.) of equal ſized bores, be fixed into the ſide of the veſſel AB; the pipe *g* being four times as deep below the ſurface of the water at *b* in the veſſel as the pipe C is: and whilſt theſe pipes run, let water be conſtantly poured into the veſſel, to keep the ſurface ſtill at the ſame height. Then, if a cup that holds a pint be ſo placed as to receive the water that ſpouts from the pipe C, and at the ſame moment a cup that holds a quart be ſo placed as to receive the water that ſpouts from the pipe *g*, both cups will be filled at the ſame time by their reſpective pipes.

The horizontal diſtance, to which a fluid will ſpout from a horizontal pipe, in any part of the ſide of an upright veſſel below the ſurface of the fluid, is equal to twice the length of a perpendicular to the ſide of the veſſel, drawn from the mouth of the pipe to a ſemicircle deſcribed upon the altitude of the fluid: and therefore, the fluid will ſpout to the greateſt diſtance poſſible from a pipe whoſe mouth is at the centre of the ſemicircle; becauſe a perpendicular to its diameter (ſuppoſed parallel to the ſide of the veſſel) drawn from that point, is the longeſt that can poſſibly be drawn from any part of the diameter to the circumference of the ſemicircle. Thus, if the veſſel AB (fig. 9.) be full of water, the horizontal pipe D be in the middle of its ſide, and the ſemicircle N*edcb* be deſcribed upon D as a centre, with the radius or ſemidiameter D*g*N, or D*fb*, the perpendicular D*d* to the diameter N*Db* is the longeſt that can be drawn from any part of the diameter to the circumference N*edcb*. And if the veſſel be kept full, the jet G will ſpout from the pipe D, to the horizontal diſtance NM, which is double the length of the perdendicular D*d*. If two other pipes as C and E, be fixed into the ſide of the veſſel at equal diſtances above and below the pipe D, the perpendiculars C*c* and E*e*, from theſe pipe to the ſemicircle, will be equal; and the jets F and H ſpouting from them will each go to the horizontal diſtance NK; which is double the length of the equal perpendiculars C*c* or D*d*.

Fluids by their preſſure may be conveyed over hills and valleys in bended pipes, to any height not greater than the level of the ſprings from whence they flow. But when they are deſigned to be raiſed higher than the ſprings, forcing engines muſt be uſed; which ſhall be deſcribed when we come to treat of pumps.

A *ſyphon*, generally uſed for decanting liquors, is a bended pipe, whoſe legs are of unequal lengths; and the ſhorteſt leg muſt always be put into the liquor intended to be decanted, that the perpendicular altitude of the column of liquor in the other leg may be longer than the column in the immerſed leg, eſpecially above the ſurface of the water. For, if both columns were equally high in that reſpect, the atmoſphere, which preſſes as much upward as downward, and therefore acts as much upward againſt the column in the leg that hangs without the veſſel, as it acts downward upon the ſurface of the liquor in the veſſel, would hinder the running of the liquor through the ſyphon, even though it were brought over the bended part by ſuction. So that there is nothing left to cauſe the motion of the liquor, but the ſuperior weight of the column in the longer leg, on account of its having the greater perpendicular height.

Let D (fig. 10.) be a cup filled with water to C, and ABC a ſyphon, whoſe ſhorter leg BCF is immerſed in the water from C to F. If the end of the other leg were no lower than the line AC, which is level with the ſurface of the water, the ſyphon would not run, even though the air ſhould be drawn out of it at the mouth A. For although the ſuction would draw ſome water at firſt, yet the water would ſtop at the moment the ſuction ceaſed; becauſe the air would act as much upward againſt the water at A, as it acted downward for it by preſſing on the ſurface at C. But if the leg AB comes down to G, and the air be drawn out at G by ſuction, the water will immediately follow, and continue to run, until the ſurface of the water in the cup comes down to F; becauſe, till then, the perpendicular height of the column BAG will be greater than that of the column CB; and conſequently, its weight will be greater, until the ſurface comes down to F; and then the ſyphon will ſtop, though the leg CF ſhould reach to the bottom of the cup. For which reaſon, the leg that hangs without the cup is always made long enough to reach below the level of its bottom; as from *d* to E: and then, when the ſyphon is emptied of air by ſuction at E, the water immediately follows, and by its continuity brings away the whole from the cup; juſt as pulling one end of a thread will make the whole clue follow.

If the perpendicular height of a ſyphon, from the ſurface of the water to its bended top at B, be more than 33 feet, it will draw no water, even though the other leg were much longer, and the ſyphon quite emptied of air, becauſe the weight of a column of water 33 feet high is equal to the weight of as thick a column of air, reaching from the ſurface of the earth to the top of the atmoſphere; ſo that there will then be an equilibrium; and conſequently, though there would be weight enough of air upon the ſurface C to make the water aſcend in the leg

leg CB almoft to the height B, if the fyphon were emptied of air, yet the weight would not be fufficient to force the water over the bend; and therefore, it could never be brought into the leg BAC.

Tantalus's cup.

LET a hole be made quite through the bottom of the cup A (fig. 11.) and the longer leg of the bended fyphon BCED be cemented into the hole, fo that the end D of the fhorter leg DE may almoft touch the bottom of the cup within. Then, if water be poured into this cup, it will rife in the fhorter leg by its upward preffure, extruding the air all the way before it through the longer leg: and when the cup is filled above the bend of the fyphon at F, the preffure of the water in the cup will force it over the bend of the fyphon: and it will defcend in the longer leg CBG, and run through the bottom, until the cup be emptied.

This is generally called *Tantalus's cup*, and the legs of the fyphon in it are almoft clofe together; and a little hollow ftatue, or figure of a man, is fometimes put over the fyphon to conceal it; the bend E being with the neck of the figure as high as the chin. So that poor thirfty *Tantalus* ftands up to the chin in water, imagining it will rife a little higher, and he may drink; but inftead of that, when the water comes up to his chin, it immediately begins to defcend; and fo, as he cannot ftoop to follow it, he is left as much pained with thirft as ever.

The fountain at command.

THE device called *the fountain at command* acts upon the fame principle with the fyphon in the cup. Let two veffels A and B (Plate C. fig. 1.) be joined together by the pipe C which opens into them both. Let A be open at top, B clofe both at top and bottom (fave only a fmall hole at *b* to let the air get out of the veffel B) and A be of fuch a fize as to hold about fix times as much water as B. Let a fyphon DEF be foldered to the veffel B, fo that the part DE*e* may be within the veffel, and F without it; the end D almoft touching the bottom of the veffel, and the end F below the level of D: the veffel B hanging at A by the pipe C (foldered into both) and the whole fupported by the pillars G and H upon the ftand I. The bore of the pipe muft be confiderably lefs than the bore of the fyphon.

The whole being thus conftructed, let the veffel A be filled with water, which will run through the pipe C, and fill the veffel B. When B is filled above the top of the fyphon at E, the water will run through the fyphon, and be difcharged at F. But fince the bore of the fyphon is larger than the bore of the pipe, the fyphon will run fafter than the pipe, and will foon empty the veffel B; upon which the water will ceafe from running through the fyphon at F, until the pipe C re-fills the veffel B, and then it will begin to run as before. And thus the fyphon will continue to run and ftop alternately, until all the water in the veffel A has run through the pipe C.—So that after a few trials, one may eafily guefs about what time the fyphon will ftop, and when it will begin to run: and then to amufe others, he may call out *ftop*, or *run*, accordingly.

Upon this principle, we may eafily account for *intermitting* or *reciprocating fprings*. Let AA (fig. 2.) be part of a hill, within which there is a cavity BB; and from this cavity a vein or channel running in the direction BCDE. The rain that falls upon the fide of the hill will fink and ftrain through the fmall pores and crannies G, G, G, G; and fill the cavity H with water. When the water rifes to the level HHC, the vein BCDE will be filled to C, and the water will run through CDF as through a fyphon; which running will continue until the cavity be emptied, and then it will ftop until the cavity be filled again.

The common pump.

THE *common fucking pump*, with which we draw water out of wells, is an engine both pneumatic and hydraulic. It confifts of a pipe open at both ends, in which is a moveable pifton, bucket, or fucker, as big as the bore of the pipe in that part wherein it works; and is leathered round, fo as to fit the bore exactly; and may be moved up and down, without fuffering any air to come between it and the pipe or pump-barrel.

We fhall explain the conftruction both of this and the forcing pump by pictures of glafs models, in which both the action of the piftons and motion of the valves are feen.

Hold the model DCBL (fig. 3.) upright in the veffel of water K, the water being deep enough to rife at leaft as high as from A to L. The valve *a* on the moveable bucket G, and the valve *b* on the fixed box H, (which box quite fills the bore of the pipe or barrel at H) will each lie clofe, by its own weight, upon the hole in the bucket and box, until the engine begins to work. The valves are made of brafs, and covered underneath with leather for clofing the holes the more exactly: and the bucket G is raifed and depreffed alternately by the handle E and rod D *d*, the bucket being fuppofed at B before the working begins.

Take hold of the handle E, and thereby draw up the bucket from B to C, which will make room for the air in the pump all the way below the bucket to dilate itfelf, by which its fpring is weakened, and then its force is not equivalent to the weight or preffure of the outward air upon the water in the veffel K: and therefore, at the firft ftroke, the outward air will prefs up the water through the notched foot A, into the lower pipe, about as far as *e*: this will condenfe the rarefied air in the pipe between *e* and C to the fame ftate it was in before; and then, as its fpring within the pipe is equal to the force or preffure of the outward air, the water will rife no higher by the firft ftroke; and the valve *b*, which was raifed a little by the dilation of the air in the pipe, will fall, and ftop the hole in the box H; and the furface of the water will ftand at *e*. Then, deprefs the pifton or bucket from C to B, and as the air in the part B cannot get back again through the valve *b*, it will (as the bucket defcends) raife the valve *a*, and fo make its way through the upper part of the barrel *d* into the open air. But upon raifing the bucket

bucket G a ſecond time, the air between it and the water in the lower pipe at *e* will be again left at liberty to fill a larger ſpace; and ſo its ſpring being again weakened, the preſſure of the outward air on the water in the veſſel K will force more water up into the lower pipe from *e* to *f*; and when the bucket is at its greateſt height C, the lower valve *b* will fall, and ſtop the hole in the box H as before. At the next ſtroke of the bucket or piſton, the water will riſe through the box H towards B, and then the valve *b*, which was raiſed by it, will fall when the bucket G is at its greateſt height. Upon depreſſing the bucket again, the water cannot be puſhed back through the valve *b*, which keeps cloſe upon the hole whilſt the piſton deſcends. And upon raiſing the piſton again, the outward preſſure of the air will force the water up thro' H, where it will raiſe the valve, and follow the bucket to C. Upon the next depreſſion of the bucket G, it will go down into the water in the barrel B; and as the water cannot be driven back through the now cloſe valve *b*, it will raiſe the valve *a* as the bucket deſcends, and will be lifted up by the bucket when it is next raiſed. And now, the whole ſpace below the bucket being full, the water above it cannot ſink when it is next depreſſed; but upon its depreſſion, the valve *a* will riſe to let the bucket go down; and when it is quite down, the valve *a* will fall by its weight, and ſtop the hole in the bucket. When the bucket is next raiſed, all the water above it will be lifted up, and begin to run off by the pipe F. And thus, by raiſing and depreſſing the bucket alternately, there is ſtill more water raiſed by it; which getting above the pipe F, into the wide top I, will ſupply the pipe, and make it run with a continued ſtream.

So, at every time the bucket is raiſed, the valve *b* riſes, and the valve *a* falls; and at every time the bucket is depreſſed, the valve *b* falls, and *a* riſes.

As it is the preſſure of the air or atmoſphere which cauſes the water to riſe and follow the piſton or bucket G as it is drawn up; and ſince a column of water 33 feet high is of equal weight with as thick a column of the atmoſphere from the earth to the very top of the air; therefore, the perpendicular height of the piſton or bucket from the ſurface of the water in the well muſt always be leſs than 33 feet; otherwiſe the water will never get above the bucket. But, when the height is leſs, the preſſure of the atmoſphere will be greater than the weight of the water in the pump, and will therefore raiſe it above the bucket; and when the water has once got above the bucket, it may be lifted thereby to any height, if the rod D be made long enough, and a ſufficient degree of ſtrength be employed, to raiſe it with the weight of the water above the bucket; without ever lengthening the ſtroke.

The force required to work a pump, will be as the height to which the water is raiſed, and as the ſquare of the diameter of the pump-bore, in that part where the piſton works. So that, if two pumps be of equal heights, and one of them be twice as wide in the bore as the other, the wideſt will raiſe four times as much water as the narroweſt; and will therefore require four times as much ſtrength to work it.

The wideneſs or narrowneſs of the pump, in any other part beſides that in which the piſton works, does not make the pump either more or leſs difficult to work; except what difference may ariſe from the friction of the bore, which is always greater in a narrow bore than in a wide one, becauſe of the greater velocity of the water.

The pump-rod is never raiſed directly by ſuch a handle as E at the top, but by means of a lever, whoſe longer arm (at the end of which the power is applied) generally exceeds the length of the ſhorter arm five or ſix times; and, by that means, gives five or ſix times as much advantage to the power. Upon theſe principles, it will be eaſy to find the dimenſions of a pump that ſhall work with a given force, and draw water from any given depth. But, as theſe calculations have been generally neglected by pump-makers (either for want of ſkill or induſtry) the following table was calculated by the late ingenious Mr Booth for their benefit. In this calculation, he ſuppoſed the handle of the pump to be a lever increaſing the power five times; and had often found that a man can work a pump four inches diameter, and 30 feet high above the bucket, and diſcharge $27\frac{1}{2}$ gallons of water (Engliſh wine meaſure) in a minute. Now, if it be required to find the diameter of a pump, that ſhall raiſe water with the ſame eaſe from any other height above the bucket; look for that height in the firſt column, and over againſt it in the ſecond you have the diameter or width of the pump; and in the third, you find the quantity of water which a man of ordinary ſtrength can diſcharge in a minute.

Height of the pump above the bucket.	Diameter of the bore where the bucket works.		Water diſcharged in a minute, Engliſh wine-meaſure.

The forcing-pump.

The *forcing-pump* raiſes water through the box H (fig. 4) in the ſame manner as the ſucking-pump does, when the plunger or piſton *g* is lifted up by the rod D*d*. But this plunger has no hole through it, to let the water in the

barrel BC get above it when it is depreſſed to B, and the valve b (which roſe by the aſcent of the water through the box H when the plunger g was drawn up) falls down and ſtops the hole in H, the moment that the plunger is raiſed to its greateſt height. Therefore, as the water between the plunger g and box H can neither get through the plunger upon its deſcent, nor back again into the lower part of the pump Le, but has a free paſſage by the cavity around H into the pipe MM, which opens into the air-veſſel KK at P; the water is forced through the pipe MM by the deſcent of the plunger, and driven into the air-veſſel; and in running up through the pipe at P, it opens the valve a; which ſhuts at the moment the plunger begins to be raiſed, becauſe the action of the water againſt the under ſide of the valve then ceaſes.

The water, being thus forced into the air-veſſel KK by repeated ſtrokes of the plunger, gets above the lower end of the pipe GHI, and then begins to condenſe the air in the veſſel KK. For, as the pipe GH is fixed air-tight into the veſſel below F, and the air has no way to get out of the veſſel but through the mouth of the pipe at I, and cannot get out when the mouth I is covered with water, and is more and more condenſed as the water riſes upon the pipe, the air then begins to act forcibly by its ſpring againſt the ſurface of the water, at H: and this action drives the water up through the pipe IH GF, from whence it ſpouts in a jet S to a great height; and is ſupplied by alternately raiſing and depreſſing of the plunger g, which conſtantly forces the water that it raiſes through the valve H, along the pipe MM, into the air-veſſel KK.

The higher that the ſurface of the water H is raiſed in the air-veſſel, the leſs ſpace will the air be condenſed into, which before filled that veſſel; and therefore the force of its ſpring will be ſo much the ſtronger upon the water, and will drive it with the greater force through the pipe at F: and as the ſpring of the air continues whilſt the plunger g is riſing, the ſtream or jet S will be uniform, as long as the action of the plunger continues: and when the valve b opens, to let the water follow the plunger upward, the valve a ſhuts, to hinder the water, which is forced into the air-veſſel, from running back by the pipe MM into the barrel of the pump.

If there was no air-veſſel to this engine, the pipe GHI would be joined to the pipe MMN at P; and then the jet S would ſtop every time the plunger is raiſed, and run only when the plunger is depreſſed.

Mr Newſham's water-engine, for extinguiſhing fire, conſiſts of two forcing-pumps, which alternately drive water into a cloſe veſſel of air; and by forcing the water into that veſſel, the air in it is thereby condenſed, and compreſſes the water ſo ſtrongly, that it ruſhes out with great impetuoſity and force through a pipe that comes down into it; and makes a continued uniform ſtream by the condenſation of the air upon its ſurface in the veſſel.

By means of forcing pumps, water may be raiſed to any height above the level of a river or ſpring; and machines may be contrived to work theſe pumps, either by a running ſtream, a fall of water, or by horſes. An inſtance in each ſort will be ſufficient to ſhew the method.

Firſt, by a running ſtream, or a fall of water. Let AA (fig. 5.) be a wheel turned by the fall of water BB; and have any number of cranks (ſuppoſe ſix) as C, D, E, F, G, H, on its axis, according to the ſtrength of the fall of water, and the height to which the water is intended to be raiſed by the engine. As the wheel turns round, theſe cranks move the levers c, d, e, f, g, h, up and down, by the iron rods i, k, l, m, n, o; which alternately raiſe and depreſs the piſtons by the other iron rods p, q, r, s, t, u, w, x, y, in twelve pumps; nine whereof, as L, M, N, O, P, Q, R, S, T, appear in the plate; the other three being hid behind the work at V. And as pipes may go from all theſe pumps, to convey the water (drawn up by them to a ſmall height) into a cloſe ciſtern, from which the main-pipe proceeds, the water will be forced into this ciſtern by the deſcent of the piſtons. And as each pipe, going from its reſpective pump into the ciſtern, has a valve at its end in the ciſtern, theſe valves will hinder the return of the water by the pipes; and therefore, when the ciſtern is once full, each piſton upon its deſcent will force the water (conveyed into the ciſtern by a former ſtroke) up the main pipe, to the height the engine was intended to raiſe it: which height depends upon the quantity raiſed, and the power that turns the wheel. When the power upon the wheel is leſſened by any defect of the quantity of water turning it, a proportionable number of the pumps may be laid aſide, by diſengaging their rods from the vibrating levers.

This figure is a repreſentation of the engine erected at Blenheim for the Duke of Marlborough, by the late ingenious Mr Alderſea. The water-wheel is $7\frac{1}{2}$ feet in diameter, according to Mr Switzer's account in his Hydraulics.

When ſuch a machine is placed in a ſtream that runs upon a ſmall declivity, the motion of the levers and action of the pumps will be but ſlow; ſince the wheel muſt go once round for each ſtroke of the pumps. But, when there is a large body of ſlow running water, a cog or ſpur-wheel may be placed upon each ſide of the water-wheel AA, upon its axis, to turn a trundle upon each ſide; the cranks being upon the axis of the trundle. And by proportioning the cog-wheels to the trundles, the motion of the pumps may be made quicker, according to the quantity and ſtrength of the water upon the firſt wheel; which may be as great as the workman pleaſes, according to the length and breadth of the float-boards or wings of the wheel. In this manner, the engine for raiſing water at London-Bridge is conſtructed; in which the water-wheel is 20 feet diameter, and the flots 14 feet long.

A quadruple pump-mill for raiſing water.

THE engine is repreſented in Plate 99. fig. 1. In which ABCD is a wheel, turned by water according to the order of the letters. On the horizontal axis are four ſmall wheels, toothed almoſt half round; and the parts of their edges on which there are no teeth are cut down ſo as to be even with the bottoms of the teeth where they ſtand.

The teeth of theſe four wheels take alternately into the

the teeth of four racks, which hang by two chains over the pullies Q and L; and to the lower ends of these racks there are four iron rods fixed, which go down into the four forcing pumps, S, R, M, and N. And, as the wheels turn, the racks and pump-rods are alternately moved up and down.

Thus, suppose the wheel G has pulled down the rack I, and drawn up the rack K by the chain: as the last tooth of G just leaves the uppermost tooth of I, the first tooth of H is ready to take into the lowermost tooth of the rack K, and pull it down as far as the teeth go; and then the rack I is pulled upward through the whole space of its teeth, and the wheel G is ready to take hold of it, and pull it down again, and so draw up the other.—— In the same manner, the wheels E and F work the racks O and P.

These four wheels are fixed on the axle of the great wheel in such a manner, with respect to the positions of their teeth, that whilst they continue turning round, there is never one instant of time in which one or other of the pump rods is not going down and forcing the water. So that, in this engine, there is no occasion for having a general air-vessel to all the pumps, to procure a constant stream of water flowing from the upper end of the main pipe.

From each of these pumps, near the lowest end, in the water, there goes off a pipe, with a valve on its farthest end from the pump; and these ends of the pipes all enter one close box, into which they deliver the water: and into this box, the lower end of the main conduct pipe is fixed. So that, as the water is forced or pushed into the box, it is also pushed up the main pipe to the height that it is intended to be raised,

A pump-engine to go by horses.

WHERE a stream or fall of water cannot be had, and gentlemen want to have water raised, and brought to their houses from a rivulet or spring; this may be effected by a horse-engine, working three forcing-pumps which stand in a reservoir filled by the spring or rivulet: the pistons being moved up and down in the pumps by means of a triple crank ABC, which, as it is turned round by the trundle G (Plate 100. fig. 6.) raises and depresses the rods D, E, F. if the wheel has three times as many cogs as the trundle has staves or rounds, the trundle and cranks will make three revolutions for every one of the wheel: and as each crank will fetch a stroke in the time it goes round, the three cranks will make nine strokes for every turn of the great wheel.

The cranks should be made of cast iron, because that will not bend; and they should each make an angle of 120 with both of the others, as at *a*, *b*, *c*; which is (as it were) a view of their radii, in looking endwise at the axis: and then there will be always one or other of them going downward, which will push the water forward with a continued stream into the main pipe. For, when *b* is almost at its lowest situation, and is therefore just beginning to lose its action upon the piston which it moves, *c* is beginning to move downward, which will by its piston continue the propelling force upon the water: and when *c* is come down to the position of *b*, *a* will be in the position of *c*.

The more perpendicularly the piston rods move up and down in the pumps, the freer and better will their strokes be: but a little deviation from the perpendicular will not be material. Therefore, when the pump-rods D, E, and F go down into a deep well, they may be moved directly by the cranks, as is done in a very good horse-engine of this sort at the late Sir James Creed's at Greenwich, which forces up water about 64 feet from a well under ground, to a reservior on the top of his house. But when the cranks are only at a small height above the pumps, the pistons must be moved by vibrating levers, as in the above engine at Blenheim: and the longer the levers are, the nearer will the strokes be to a perpendicular.

Let us suppose, that in such an engine as Sir James Creed's, the great wheel is twelve feet diameter, the trundle four feet, and the radius or length of each crank nine inches, working a piston in its pump. Let there be three pumps in all, and the bore of each pump be four inches diameter. Then, if the great wheel has three times as many cogs as the trundle has staves, the trundle and cranks will go three times round for each revolution of the horses and wheel, and the three cranks will make nine strokes of the pumps in that time, each stroke being 18 inches (or double the length of the crank) in a four-inch bore. Let the diameter of the horse-walk be 18 feet, and the perpendicular height to which the water is raised above the surface of the well be 64 feet.

If the horses go at the rate of two miles an hour (which is very moderate walking) they will turn the great wheel 187 times round in an hour.

In each turn of the wheel the pistons make nine strokes in the pumps, which amount to 1683 in an hour.

Each stroke raises a column of water 18 inches long, and four inches thick, in the pump barrels; which column, upon the descent of the piston, is forced into the main pipe, whose perpendicular altitude above the surface of the well is 64 feet.

Now, since a column of water 18 inches long, and four inches thick, contains 226.18 cubic inches, this number multiplied by 1683 (the strokes in an hour) gives 380661 for the number of cubic inches of water raised in an hour.

A gallon, in wine-measure, contains 231 cubic inches, by which divide 380661, and it quotes 1468 in round numbers, for the number of gallons raised in an hour; which, divided by 63, gives $26\frac{1}{7}$ hogsheads ——If the horses go faster, the quantity raised will be so much the greater.

In this calculation it is supposed that no water is wasted by the engine. But as no forcing engine can be supposed to lose less than a fifth part of the calculated quantity of water, between the pistons and barrels, and by the opening and shutting of the valves, the horses ought to walk almost $2\frac{1}{2}$ miles *per* hour to fetch up this loss.

A column of water four inches thick, and 64 feet high, weighs $349\frac{9}{10}$ pounds averdupoise, or $424\frac{5}{11}$ pounds troy; and this weight, together with the friction of the engine, is the resistance that must be overcome by the strength of the horses.

The

The horſe tackle ſhould be ſo contrived, that the horſes may rather puſh on than drag the levers after them. For if they draw, in going round the walk, the outſide leather-ſtraps will rub againſt their ſides and hams; which will hinder them from drawing at right angles to the levers, and ſo make them pull at a diſadvantage. But if they puſh the levers before their breaſts, inſtead of dragging them, they can always walk at right angles to theſe levers.

It is no ways material what the diameter of the main or conduct pipe be: for the whole reſiſtance of the water therein, againſt the horſes, will be according to the height to which it is raiſed, and the diameter of that part of the pump in which the piſton works; as we have already obſerved. So that by the ſame pump, an equal quantity of water may be raiſed in (and conſequently made to run from) a pipe of a foot diameter, with the ſame eaſe as in a pipe of five or ſix inches; or rather with more eaſe, becauſe its velocity in a large pipe will be leſs than in a ſmall one, and therefore its friction againſt the ſides of the pipe will be leſs alſo.

And the force required to raiſe water depends not upon the length of the pipe, but upon the perpendicular height to which it is raiſed therein above the level of the ſpring. So that the ſame force, which would raiſe water to the height AB (fig. 7.) in the upright pipe *AiklmnopqB*, will raiſe it to the ſame height or level BIH in the oblique pipe AEFGH. For the preſſure of the water at the end A of the latter, is no more than its preſſure againſt the end A of the former.

The weight or preſſure of water at the lower end of a pipe, is always as the ſine of the angle to which the pipe is elevated above the level parallel to the horizon. For, although the water in the upright pipe AB would require a force applied immediately to the lower end A, equal to the weight of all the water in it, to ſupport the water, and a little more to drive it up and out of the pipe; yet if that pipe be inclined from its upright poſition to an angle of 80 degrees (as in A 80), the force required to ſupport or to raiſe the ſame cylinder of water will then be as much leſs as the ſine 80 *h* is leſs than the radius AB; or as the ſine of 80 degrees is leſs than the ſine of 90. And ſo, decreaſing as the ſign of the angle of elevation leſſens, until it arrives at its level AC or place of reſt, where the force of the water is nothing at either end of the pipe. For, although the abſolute weight of the water is the ſame in all poſitions, yet its preſſure at the lower end decreaſes, as the ſine of the angle of elevation decreaſes; as will appear plainly by a farther conſideration of the figure.

Let two pipes, AB and BC, of equal lengths and bores, join each other at A; and let the pipe AB be divided into 100 equal parts, as the ſcale S is; whoſe length is equal to the length of the pipe.—Upon this length, as a radius, deſcribe the quadrant BCD, and divide it into 90 equal parts or degrees.

Let the pipe AC be elevated to 10 degrees upon the quadrant, and then filled with water; then, part of the water that is in it will riſe in the pipe AB, and if it be kept full of water, it will raiſe the water in the pipe AB from A to *i*; that is, to a level *i* 10 with the mouth of the pipe at 10: and the upright line *a* 10, equal to A*i*, will be the ſine of 10 degrees elevation; which being meaſured upon the ſcale S, will be about 17.4 of ſuch parts as the pipe contains 100 in length: and therefore, the force or preſſure of the water at A, in the pipe A 10, will be to the force or preſſure at A in the pipe AB as 17.3 to 100.

Let the ſame pipe be elevated to 20 degrees in the quadrant, and if it be kept full of water, part of that water will run into the pipe AB, and riſe therein to the height A*k*, which is equal to the length of the upright line *b* 20, or to the ſine of 20 degrees elevation; which, being meaſured upon the ſcale S, will be 34.2 of ſuch parts as the pipe contains 100 in length; and therefore the preſſure of the water at A, in the full pipe A 20, will be to its preſſure, if that pipe were raiſed to the perpendicular ſituation AB, as 34.2 to 100.

17	292	35	573	53	799	71	945	89	1000
18	309	36	588	54	809	72	951	90	1000

Elevate the pipe to the pofition A 30 on the quadrant; and if it be fupplied with water, the water will rife from it into the pipe AB, to the height *Al*, or to the fame level with the mouth of the pipe at 30. The fine of this elevation, or of the angle of 30 degrees, is *c* 30; which is juft equal to half the length of the pipe, or to 50 of fuch parts of the fcale as the length of the pipe contains 100. Therefore, the preffure of the water at A, in a pipe elevated 30 degrees above the horizontal level, will be equal to one half of what it would be, if the fame pipe ftood upright in the fituation AB.

And thus, by elevating the pipe to 40, 50, 60, 70, and 80 degrees on the quadrant, the fines of thefe elevations will be *d* 40, *e* 50, *f* 60, *g* 70, and *h* 80; which will be equal to the heights *Am*, *An*, *Ao*, *Ap*, and *Aq*; and thefe heights meafured upon the fcale 8 will be 64.3, 76.6, 86.6, 94.0, and 98.5; which exprefs the preffures at A in all thefe elevations, confidering the preffure in the upright pipe AB as 100.

Becaufe it may be of ufe to have the lengths of all the fines of a quadrant from 0 degrees to 90, we have given the foregoing table, fhewing the length of the fine of every degree in fuch parts as the whole pipe (equal to the radius of the quadrant) contains 1000. Then the fines will be integral or whole parts in length. But if you fuppofe the length of the pipe to be divided only into 100 equal parts, the laft figure of each part or fine muft be cut off as a decimal; and then thofe which remain at the left hand of this feparation will be integral or whole parts.

Thus, if the radius of the quadrant (fuppofed to be equal to the length of the pipe AC) be divided into 1000 equal parts, and the elevation be 45 degrees, the fine of that elevation will be equal to 707 of thefe parts; but if the radius be divided into 100 equal parts, the fame fine will be only 70.7 or $70\frac{7}{10}$ of thefe parts. For, as 1000 is to 707, fo is 100 to 70.7.

As it is of great importance to all engine makers, to know what quantity and weight of water will be contained in an upright round pipe of a given diameter and height, fo as, by knowing what weight is to be raifed, they may proportion their engines to the force which they can offord to work them; we fhall fubjoin tables fhewing the number of cubic inches of water contained in an upright pipe of a round bore, of any diameter from one inch to fix and a half; and of any height from one foot to two hundred: together with the weight of the faid number of cubic inches, both in troy and avoirdoirdupoife ounces. The number of cubic inches divided by 231, will reduce the water to gallons in wine-meafure; and divided by 382, will reduce it to the meafure of ale-gallons. Alfo, the troy ounces divided by 12, will reduce the weight to troy pounds: and the avoirdupoife ounces divided by 16, will reduce the weight to avoirdupoife pounds.

And here we muft repeat it again, that the weight or preffure of the water acting againft the power that works the engine muft always be eftimated according to the perpendicular height to which it is to be raifed, without any regard to the length of the conduct pipe, when it has an oblique pofition; and as if the diameter of that pipe were juft equal to the diameter of that part of the pump in which the pifton works. Thus by the tables on the two following pages, the preffure of the water againft an engine whofe pump is of a $4\frac{1}{2}$ inch bore, and the perpendicular height of the water in the conduct-pipe is 80 feet, will be equal to 8057.5 troy ounces, and to 8848.2 avoirdupoife ounces; which makes 671.4 troy pounds, and 553 avoirdupoife.

EXAMPLE. *Required the number of cubic inches, and the weight of the water, in an upright pipe* 278 *feet high, and* $1\frac{1}{2}$ *inch diameter?*

	Feet.	*Cubic inches.*	*Troy oz.*	*Avoir. oz.*
	200	4241.1	2238.2	2457.8
	70	1484.1	783.3	860.2
	8	169.6	89.5	98.3
Anfw.	278	5895.1	3111.0	3416.3

Here the neareft fingle decimal figure is only taken into the account; and the whole, being reduced by divifion, amounts to $25\frac{1}{2}$ wine-gallons in meafure, to $259\frac{1}{4}$ pounds troy, and $213\frac{1}{2}$ pounds avoirdupoife.

Thefe tables were at firft calculated to fix decimal places for the fake of exactnefs; but in tranfcribing them there are no more than two decimal figures taken into the account, and fometimes but one; becaufe there is no neceffity for computing to hundredth parts of an inch or of an ounce in practice.

The fire engine.

THE *fire-engine* comes next in order to be explained: but as it would be difficult, even by the beft plates, to give a particular defcription of its feveral parts, fo as to make the whole intelligible, we fhall only explain the principles upon which it is conftructed.

1. Whatever weight of water is to be raifed, the pump-rod muft be loaded with weights fufficient for that purpofe, if it be done by a forcing-pump, as is generally the cafe: and the power of the engine muft be fufficient for the weight of the rod, in order to bring it up.

2. It is known, that the atmofphere preffes upon the furface of the earth with a force equal to 15 pounds upon every fquare inch.

3. When water is heated to a certain degree, the particles thereof repel one another, and conftitute an elaftic fluid, which is generally called fteam or vapour.

4. Hot fteam is very elaftic; and when it is cooled by any means, particularly by its being mixed with cold water, its elafticity is deftroyed immediately, and it is reduced to water again.

5. If a veffel be filled with hot fteam, and then clofed fo as to keep out the external air and all other fluids; when that fteam is by any means condenfed, cooled, or reduced to water, that water will fall to the bottom of the veffel; and the cavity of the veffel will be almoft a perfect vacuum.

6. Whenever a vacuum is made in any veffel, the air by its weight will endeavour to rufh into the veffel, or

to drive in any other body that will give way to its preſſure; as may be eaſily ſeen by a common ſyringe. For, if you ſtop the bottom of a ſyringe, and then draw up the piſton, if it be ſo tight as to drive out all the air before it, and leave a vacuum within the ſyringe, the piſton being let go will be driven down with a great force.

7. The force with which the piſton is drove down, when there is a vacuum under it, will be as the ſquare of the diameter of the bore in the ſyringe. That is to ſay, it will be driven down with four times as much force in a ſyringe of a two-inch bore, as in a ſyringe of one inch: for the areas of circles are always as the ſquares of their diameters.

8. The preſſure of the atmoſphere being to 15 pounds upon every ſquare inch, it will be equal to about 12 pounds upon every circular inch. So that if the bore of the ſyringe be round, and one inch in diameter, the piſton will be preſt down into it by a force nearly equal to 12 pounds: but if the bore be two inches diameter, the piſton will be preſt down with four times that force.

And hence it is eaſy to find with what force the atmoſphere preſſes upon any given number either of ſquare or circular inches.

Theſe being the principles upon which this engine is conſtructed, we ſhall next deſcribe the chief working parts of it: which are, 1. A boiler. 2. A cylinder and piſton. 3. A beam or lever.

The boiler is a large veſſel made of iron or copper; and commonly ſo big as to contain about 2000 gallons.

The cylinder is about 40 inches diameter, bored ſo ſmooth, and its leathered piſton fitting ſo cloſe, that little or no water can get between the piſton and ſides of the cylinder.

Things being thus prepared, the cylinder is placed upright, and the ſhank of the piſton is fixed to one end of the beam, which turns on a centre like a common balance.

The boiler is placed under the cylinder, with a communication between them, which can be opened and ſhut occaſionally.

The boiler is filled about half full of water, and a ſtrong fire is made under it: then, if the communication between the boiler and the cylinder be opened, the cylinder will be filled with hot ſteam; which would drive the piſton quite out at the top of it. But there is a contrivance by which the piſton, when it is near the top of the cylinder, ſhuts the communication at the top of the boiler within.

This is no ſooner ſhut, than another is opened, by which a little cold water is thrown upwards in a jet into the cylinder, which mixing with the hot ſteam, condenſes it immediately; by which means a vacuum is made in the cylinder, and the piſton is preſſed down by the weight of the atmoſphere; and ſo lifts up the loaded pump-rod at the other end of the beam.

If the cylinder be 42 inches in diameter, the piſton will be preſſed down with a force greater than 20000 pounds, and will conſequently lift up that weight at the oppoſite end of the beam: and as the pump-rod with its plunger is fixed to that end, if the bore where the plunger works were 10 inches diameter, the water would be forced up through a pipe of 180 yards perpendicular height.

But, as the parts of this engine have a good deal of friction, and muſt work with a conſiderable velocity, and there is no ſuch thing as making a perfect vacuum in the cylinder, it is found that no more than 8 pounds of preſſure muſt be allowed for, on every circular inch of the piſton in the cylinder, that it may make about 16 ſtrokes in a minute, about 6 feet each.

Where the boiler is very large, the piſton will make between 20 and 25 ſtrokes in a minute, and each ſtroke 7 or 8 feet; which, in a pump of 9 inches bore, will raiſe upwards of 300 hogſheads of water in an hour.

It is found by experience, that a cylinder 40 inches diameter will work a pump 10 inches diameter and 100 yards long: and hence we can find the diameter and length of a pump that can be worked by any other cylinder.

For the conveniency of thoſe who would make uſe of this engine for raiſing water, we ſhall ſubjoin part of a table calculated by Mr. Beighton, ſhewing how any given quantity of water may be raiſed in an hour, from 48 to 440 hogſheads; at any given depth, from 15 to 100 yards; the machine working at the rate of 16 ſtrokes *per* minute, and each ſtroke being 6 feet long.

One example of the uſe of this table, will make the whole plain. Suppoſe it were required to draw 150 hogſheads *per* hour, at 90 yards depth; in the ſecond column from the right hand, I find the neareſt number, *viz.* 149 hogſheads 40 gallons; againſt which, on the right hand, I find the diameter of the bore of the pump muſt be 7 inches; and in the ſame collateral line, under the given depth 90, I find 27 inches, the diameter of the cylinder fit for that purpoſe.—And ſo for any other.

A Table ſhewing the Power of the Engine for raiſing Water by Fire;
Calculated to the Meaſure of Ale-gallons, at 282 cubic Inches *per* Gallon.

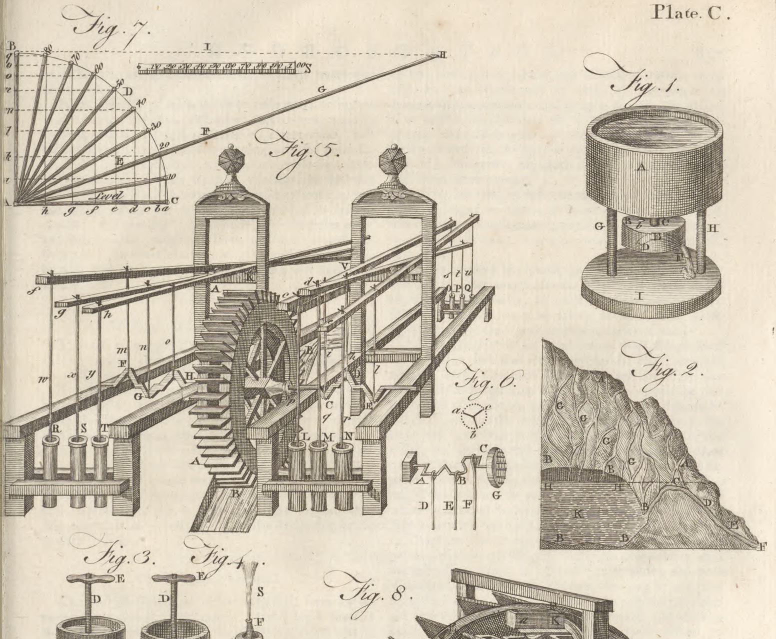
The Perſian wheel.

Water may be raiſed by means of a ſtream AB (Plate 100. fig. 8.) turning a wheel CDE, according to the order of the letters, with buckets *a,a,a,a,* &c. hung upon the wheel by ſtrong pins *b,b,b,b,* &c. fixed in the ſide of the rim: but the wheel muſt be made as high as the water is intended to be raiſed above the level of that part of the ſtream in which the wheel is placed. As the wheel turns, the buckets on the right hand go down into the water, and are thereby filled; and go up full on the left hand, until they come to the top at K; where they ſtrike againſt the end *n* of the fixed trough M, and are thereby overſet, and empty the water into the trough; from which it may be conveyed in pipes to the place which it is deſigned for: and as each bucket gets over the trough, it falls into a perpendicular poſition again, and goes down empty, until it comes to the water at A, where it is filled as before. On each bucket is a ſpring *r*, which going over the top or crown of the bar *m* (fixed to the trough M) raiſes the bottom of the bucket above above the level of

Plate. C.



A. Bell Sc.

of its mouth, and fo caufes it to empty all its water into the trough.

Sometimes this wheel is made to raife water no higher than its axis; and then, inftead of buckets hung upon it, its fpokes C, *d*, *e*, *f*, *g*, *h* are made of a bent form, and hollow within; thefe hollows opening into the holes C, D, E, F, in the outfide of the wheel, and alfo into thofe at O in the box N upon the axis. So that, as the holes C, D, *&c.* dip into the water, it runs into them; and as the wheel turns, the water rifes in the hallow fpokes, *c*, *d*, &c. and runs out in a ftream P from the holes at O, and falls into the trough Q, from whence it is conveyed by pipes. And this is a very eafy way of raifing water, becaufe the engine requires neither men nor horfes to turn it.

Of the fpecific gravities of bodies.

The art of weighing different bodies in water, and thereby finding their fpecific gravities, or weights, bulk for bulk, was invented by Archimedes.

The fpecific gravities of bodies are as their weights, bulk for bulk: thus a body is faid to have two or three times the fpecific gravity of another, when it contains two or three times as much matter in the fame fpace.

A body immerfed in a fluid will fink to the bottom, if it be heavier than its bulk of the fluid. If it be fufpended therein, it will lofe as much of what it weighed in air, as its bulk of the fluid weighs. Hence, all bodies of equal bulk, which would fink in fluids, lofe equal weights when fufpended therein. And unequal bodies lofe in proportion to their bulks.

The hydroftatic balance.

The *hydroftatic balance* differs very little from a common balance that is nicely made: only it has a hook at the bottom of each fcale, on which fmall weights may be hung by horfe-hairs, or by filk threads. So that a body, fufpended by the hair or thread, may be immerfed in water without wetting the fcale from which it hangs.

If the body thus fufpended under the fcale, at one end of the balance, be firft counterpoifed in air by weights in the oppofite fcale, and then immerfed in water, the equilibrium will be immediately deftroyed. Then, if as much weight be put into the fcale from which the body hangs as will reftore the equilibrium (without altering the weights in the oppofite fcale) that weight which reftores the equilibrium will be equal to the weight of a quantity of water as big as the immerfed body. And if the weight of the body in air be divided by what it lofes in water, the quotient will fhew how much that body is heavier than its bulk of water. Thus, if a guinea fufpended in air be counterbalanced by 129 grains in the oppofite fcale of the balance; and then, upon its being immerfed in water, it becomes fo much lighter as to require $7\frac{1}{4}$ grains put into the fcale over it, to reftore the equilibrium; it fhews that a quantity of water of equal bulk with the guinea, weighs $7\frac{1}{4}$ grains, or 7.25; by which divide 129 (the weight of the guinea in air) and the quotient will be 17.793; which fhews that the guinea is 17.793 times as heavy as its bulk of bulk of water. And thus any piece of gold may be tried, by weighing it firft in air, and then in water; and if, upon dividing the weight in air by the lofs in water, the quotient comes out to be 17.793, the gold is good; if the quotient be 18, or between 18 and 19, the gold is very fine; but if it be lefs than $17\frac{1}{7}$, the gold is too much allayed, by being mixed with fome other metal.

If filver be tried in this manner, and found to be 11 times as heavy as water, it is very fine; if it be $10\frac{1}{2}$ times as heavy, it is ftandard; but if it be of any lefs weight compared with water, it is mixed with fome lighter metal, fuch as tin.

By this method the fpecific gravities of all bodies that will fink in water may be found. But as to thofe which are lighter than water, as moft forts of wood are, the following method may be taken, to fhew how much lighter they are than their refpective bulks of water.

Let an upright ftud be fixed into a thick flat piece of brafs, and in this ftud let a fmall lever, whofe arms are equally, long turn upon a fine pin as an axis. Let the thread which hangs from the fcale of the balance be tied to one end of the lever, and a thread from the body to be weighed tied to the other end. This done, put the brafs and lever into a veffel: then pour water into the veffel, and the body will rife and float upon it, and draw down the end of the balance from which it hangs: then, put as much weight in the oppofite fcale as will raife that end of the balance, fo as to pull the body down into the water by means of the lever; and this weight in the fcale will fhew how much the body is lighter than its bulk of water.

There are fome things which cannot be weighed in this manner, fuch as quickfilver, fragments of diamonds, *&c.* becaufe they cannot be fufpended in threads; and muft therefore be put into a glafs bucket, hanging by a thread from the hook of one fcale, and counterpoifed by weights put into the oppofite fcale. Thus, fuppofe you want to know the fpecific gravity of quickfilver, with refpect to that of water; let the empty bucket be firft counterpoifed in air, and then the quickfilver put into it and weighed. Write down the weight of the bucket, and alfo of the quickfilver; which done, empty the bucket, and let it be immerfed in water as it hangs by the thread, and counterpoifed therein by weights in the oppofite fcale: then, pour the quickfilver into the bucket in the water, which will caufe it to preponderate; and put as much weight into the oppofite fcale as will reftore the balance to an equipoife; and this weight will be the weight of a quantity of water equal in bulk to the quickfilver. Laftly, divide the weight of the quickfilver in air, by the weight of its bulk of water, and the quotient will fhew how much the quickfilver is heavier than its bulk of water.

If a piece of brafs, glafs, lead, or filver, be immerfed and fufpended in different forts of fluids, its different loffes of weight therein will fhew how much it is heavier than its bulk of the fluid; the fluid being lighteft, in which the immerfed body lofes leaft of its aerial weight A folid bubble of glafs is generally ufed for finding the fpecific gravities of fluids.

Hence we have an eafy method of finding the fpecific gravities both of folids and fluids, with regard to the re-

ſpective bulks of common pump water, which is generally made a ſtandard for comparing all the others by.

In conſtructing tables of ſpecific gravities with accuracy, the gravity of water muſt be repreſented by unity or 1.000, where three cyphers are added, to give room for expreſſing the ratios of other gravities in decimal parts, as in the following table.

Take away the decimal point from the numbers in the right hand column, or (which is the ſame) multiply them by 1000, and they will ſhew how many ounces avoirdupoiſe are contained in a cubic foot of each body.

How to find out the quantity of adulteration in metals.

THE uſe of the table of ſpecific gravities will beſt appear by an example. Suppoſe a body to be compounded of of gold and ſilver, and it is required to find the quantity of each metal in the compound.

Firſt find the ſpecific gravity of the compound, by weighing it in air and in water, and dividing its aerial weight by what it loſes thereof in water, the quotient will ſhew its ſpecific gravity, or how many times it is heavier than its bulk of water. Then, ſubtract the ſpecific gravity of ſilver (found in the table) from that of the compound, and the ſpecific gravity of the compound from that of gold; the firſt remainder ſhews the bulk of gold, and the latter the bulk of ſilver, in the whole compound: and if theſe remainders be multiplied by the reſpective ſpecific gravities, the products will ſhew the proportion of weights of each metal in the body. Example.

Suppoſe the ſpecific gravity of the compounded body to be 13; that of ſtandard ſilver (by the table) is 10.5, and that of gold 19.63: therefore 10.5 from 13, remains 2.5, the proportional bulk of the gold; and 13 from 19.63, remains 6.63, the proportional bulk of ſilver in the compound. Then, the firſt remainder 2.5, multiplied by 19.63, the ſpecific gravity of gold, produces 49.075 for the proportional weight of gold; and the laſt remainder 6.63 multiplied by 10.5, the ſpecific gravity of ſilver, produces 69.615 for the proportional weight of ſilver in the whole body. So that, for every 49.07 ounces or pounds of gold, there are 69.6 pounds or ounces of ſilver in the body.

Hence it is eaſy to know whether any ſuſpected metal be genuine, or allayed, or counterfeit; by finding how much it is heavier than its bulk of water, and comparing the ſame with the table: if they agree, the metal is good; if they differ, it is allayed or counterfeited.

How to try ſpirituous liquors.

A CUBICAL inch of good brandy, rum, or other proof ſpirits, weighs 235.7 grains; therefore, if a true inch cube of any metal weighs 235.7 grains leſs in ſpirits than in air, it ſhews the ſpirits are proof. If it loſes leſs of its aerial weight in ſpirits, they are above proof: if it loſes more, they are under. For, the better the ſpirits are, they are the lighter; and the worſe, the heavier.

The hydrometer is one of the moſt uſeful inſtruments of the philoſophic kind; for though the hydroſtatical balance be the moſt general inſtrument for finding the

ſpecific gravities of all ſorts of bodies yet the hydrometer is beſt ſuited to find thoſe of fluids in particular, both as to eaſe and expedition.

This inſtrument ſhould be made of copper, ſince ivory imbibes ſpirituous liquours, and thereby alters its gravity; and glaſs is apt to break The moſt ſimple kind, uſed for finding the ſtrength of ſpirits, conſiſts of a copper-ball B*b* Plate 101. (fig 1. n° 1.) with a braſs wire, AB, $\frac{1}{4}$ of an inch thick, ſoldered into it. The upper part of this wire being filed flat on one ſide, is marked proof at *m*, becauſe it ſinks exactly to this mark in proof ſpirits. There are other two marks at A and B, to ſhew whether the liquor be $\frac{1}{10}$ above or below proof, according as the hydrometer ſinks to A or emerges to B, when a braſs weight as C or K has been ſcrewed on at the bottom *c*. There are alſo weights to be ſcrewed on, for ſhewing the ſpecific gravities of fluids quite to common water. The round part of the wire above the ball, may be marked ſo as to repreſent river water when it ſinks to R W, (*ibid* n° 2.) the weight which fits the inſtrument for river water being ſcrewed on at *c*: alſo when put into ſpring-water, mineral water, ſea-water, and water of ſalt ſprings, it will emerge or riſe gradually to the marks SP, MI, SE, SA; and, on the contrary, when put into Briſtol-water, rain-water, port-wine, and mountain wine, it will ſucceſſively ſink to the marks, *br*, *ra*, *po*, *mo*.

Another kind, which ſerves to diſtinguiſh the ſpecific differences of fluids to great nicety, conſiſts of a large hollow ball B, (*ibid*. n° 3.) with a ſmaller ball *b* under it, partly filled with quick ſilver or ſmall ſhot, and ſcrewed on to the lower part of the former, in order to render it but little ſpecifically lighter than water: it has alſo a ſmall ſhort neck at C, into which is ſcrewed the graduated braſs-wire AC, which by its weight cauſes the body of the inſtrument to deſcend in the fluid, with part of the ſtem.

When this inſtrument is ſwimming in the liquor, contained in the jar ILMK, the part of the fluid diſplaced

placed by it will be equal in bulk to the part of the inftrument under water, and equal in weight to that of the whole inftrument. Suppofe the weight of the whole were 4000 grains, then it is evident we can by this means compare together the different bulks of 4000 grains of various forts of fluids. For if the weight A be fuch as fhall caufe the aræometer to fink in rain-water, till its furface comes to the middle point of the ftem 20; and if, after this, it be immerfed in common fpring water, and the furface is obferved to ftand $\frac{1}{10}$ of an inch below the middle point 20; it is evident that the fame weight of each water differs in bulk only by the magnitude of $\frac{1}{10}$ of an inch in the ftem.

Now fuppofe the ftem were ten inches long, and weighed 100 grains, then every tenth of an inch would be one grain weight; and fince the ftem is of brafs, and brafs is about eight times heavier than water, the fame bulk of water will be equal to $\frac{1}{8}$ of a grain; and confequently to the $\frac{1}{8}$ of $\frac{1}{4000}$ part, that is, a 3200dth part of the whole bulk, which is a degree of exactnefs as great as can be defired. Yet the inftrument is capable of ftill greater exactnefs, by making the ftem or neck confift of a flat thin flip of brafs, inftead of one that is round or cylindrical: by this means we increafe the furface, which is the moft requifite thing; and diminifh the folidity, by which the inftrument is rendered more exact.

In order to adapt this inftrument to all forts of ufes, there ought to be two different ftems to fcrew on and off in a fmall hole at *a*. One ftem fhould be fuch a nice thin flip of brafs, or rather of fteel, like a watch-fpring fet ftraight, as we have juft mentioned, on one fide of which ought to be the feveral marks or divifions to which it will fink in various forts of waters, as rain-water, river-water, fpring-water, fea-water, falt fpring-water, *&c*. And on the other fide you mark the divifion to which it finks in various lighter fluids, as hot bath water, Briftol water, Lincomb water, Chelten water, port-wine, mountain, madeira, and various other forts of wine. But in this cafe the weight A on the top muft be a little lefs than before, when it was ufed for the heavier waters.

But, in cafe of trying the ftrength of fpirituous liquors, a common cylindric ftem will do beft, becaufe of its ftrength and fteadinefs; and this ought to be fo contrived, that, when immerfed in what is called proof-fpirit, the furface of the fpirit may be upon the middle point 20; which is eafily done by duly adjufting the fmall weight A on the top, and making the ftem of fuch a length, that, when immerfed in water, it may juft cover the ball, and rife to *a*; but, when immerfed in pure fpirit, it may arife to the top at A; then by dividing the upper and lower parts *a* 20, A 20, into ten equal parts each, when the inftrument is immerfed in any fort of fpirituous liqour, it will immediately fhew how much it is above or below proof.

This proof-fpirit confifts of half water and half alcohol or pure fpirit: that is, fuch as when poured upon gunpowder, and fet on fire, will burn all away, and permit the powder to take fire, which it will, and flafh as in the open air. But if the fpirit be not fo highly rectified, there will remain fome phlegm or water, which will make the powder wet, and unfit to take fire. This proof-fpirit of any kind weighs feven pounds twelve ounces per gallon.

The common method of fhaking the fpirits in a vial, and, by raifing a crown of bubbles, to judge by the manner of their rifing or breaking away whether the fpirit be proof or near it, is very precarious, and capable of great fallacy. There is no way fo eafy, quick, certain, and philofophical, as this by the aræometer, which will demonftrate infallibly the difference of bulks, and confequently fpecific gravities, in equal weights of fpirits, to the 30, 40, or 50 thoufandth part of the whole, which is a degree of accuracy beyond which nothing can be defired.

All bodies expand with heat, and contract with cold; but fome more and fome lefs than others: and therefore the fpecific gravities of bodies are not precifely the fame in fummer as in winter. It has been found, that a cubic inch of good brandy is 10 grains heavier in winter than in fummer; as much fpirit of nitre, 20 grains; vinegar 6 grains, and fpring water 3. Hence it is moft profitable to buy fpirits in winter, and fell them in fummer, fince they are always bought and fold by meafure. It has been found, that 32 gallons of fpirits in winter will make 33 in fummer.

The expanfion of all fluids is proportionable to the degree of heat; that is, with a double or triple heat a fluid will expand two or three times as much.

Upon thefe principles depends the conftruction of the thermometer, in which the globe or bulb, and part of the tube, are filled with a fluid, which, when joined to the barometer, is fpirits of wine tinged, that it may be the more eafily feen in the tube. But when thermometers are made by themfelves, quickfilver is generally ufed.

In the thermometer, a fcale is fitted to the tube, to fhew the expanfion of the quickfilver, and confequently the degree of heat. And, as *Farenheit's* fcale is moft in efteem at prefent, we fhall explain the conftruction and graduation of thermometers according to that fcale.

Firft, let the globe or bulb, and part of the tube, be filled with a fluid; then immerfe the bulb in water juft freezing, or fnow juft thawing; and even with that part in the fcale where the fluid then ftands in the tube, place the number 32, to denote the freezing point: then put the bulb under your arm pit, when your body is of a moderate degree of heat, fo that it may acquire the fame degree of heat with your fkin; and when the fluid has rifen as far as it can by that heat, there place the number 97: then divide the fpace between thefe numbers into 65 equal parts, and continue thofe divifions both above 97 and below 32, and number them accordingly.

This may be done in any part of the world; for it is found that the freezing point is always the fame in all places, and the heat of the human body differs but very little: fo that the thermometers made in this manner will

will agree with one another: and the heat of ſeveral bodies will be ſhewn by them, and expreſſed by the number upon the ſcale, thus.

Air, in ſevere cold weather, in our climate, from 15 to 25. Air in winter, from 26 to 42. Air in ſpring and autumn, from 43 to 53. Air at midſummer, from 65 to 68. Extreme heat of the ſummer ſun, from 86 to 100. Butter juſt melting, 95. Alcohol boils with 174 or 175. Brandy with 190. Water 212. Oil of turpentine 550. Tin melts with 408, and lead with 540. Milk freezes about 30, vinegar 28, and blood 27.

A body ſpecifically lighter than a fluid will ſwim upon its ſurface, in ſuch a manner, that a quantity of the fluid equal in bulk with the immerſed part of the body, will be as heavy as the whole body. Hence, the lighter a fluid is, the deeper a body will ſink in it; upon which depends the conſtruction of the hydrometer or water-poiſe.

From this we can eaſily find the weight of a ſhip, or any other body that ſwims in water. For, if we multiply the number of cubic feet which are under the ſurface, by 62.5, the number of pounds in one foot of freſh water; or by 63, the number of pounds in a foot of ſalt water; the product will be the weight of the ſhip, and all that is in it. For, ſince it is the weight of the ſhip that diſplaces the water, it muſt continue to ſink until it has removed as much water as is equal to it in weight; and therefore the part immerſed muſt be equal in bulk to ſuch a portion of the water as is equal to the weight of the whole ſhip.

To prove this by experiment, let a ball of ſome light wood, ſuch as fir or pear-tree, be put into water contained in a glaſs veſſel; and let the veſſel be put into a ſcale at one end of a balance, and counterpoiſed by weights in the oppoſite ſcale: then, marking the height of the water in the veſſel, take out the ball; and fill up the veſſel with water to the ſame height that it ſtood at when the ball was in it; and the ſame weight will counterpoiſe it as before.

From the veſſel's being filled up to the ſame height at which the water ſtood when the ball was in it, it is evident that the quantity poured in is equal in magnitude to the immerſed part of the ball; and from the ſame weight counterpoiſing, it is plain that the water poured in is equal in weight to the whole ball.

In troy weight, 24 grains make a pennyweight, 20 pennyweight make an ounce, and 12 ounces a pound. In avoirdupoiſe weight, 16 drams make an ounce, and 16 ounces a pound. The troy pound contains 5760 grains, and the avoirdupoiſe pound 7000: and hence, the avoirdupoiſe dram weighs 27.34375 grains, and the avoirdupoiſe ounce 437.5.

H Y P

HYGROMETER, a machine, or inſtrument whereby to meaſure the degrees of drineſs, or moiſture of the air, or rather of the atmoſphere.

There are divers ſorts of hygrometers; for whatever body either ſwells or ſhrinks, by dryneſs or moiſture, is capable of being formed into an hygrometer. Such are woods of moſt kinds particularly aſh, deal, poplar, *&c.* Such alſo is catgut, the beard of a wild oat, *&c.*

HYMEN, in anatomy. See ANATOMY, p. 277.

HYMENÆA, in botany, a genus of the decandria monogynia claſs. The calix conſiſts of five ſegments, and the corolla of five petals; and the pod is filled with a farinaceous pulp. There is but one ſpecies, a native of America.

HYMENÆAL, ſomething belong to marriage, ſo called from hymen.

HYMN, a religious ſong. The hymns ſung in the chriſtian church, as diſtinguiſhed from the pſalms, are pieces of poetry compoſed by pious but not inſpired authors.

HYOIDES, in anatomy. See ANATOMY, p. 166.

HYOSCYAMUS, HEN-BANE, in botany, a genus of the pentandria monogynia claſs. The corolla is obtuſe and funnel ſhaped; the ſtamina are inclined; and the capſule is operculated, and conſiſts of two cells. There are ſix ſpecies, only one of which, *viz.* the niger, or common hen-bane, is a native of Britain. The leaves, *&c.* of this plant are highly narcotic and poiſonous, and now diſregarded in practice.

HYOTHYROIDES, in anatomy. See ANATOMY, p. 300.

H Y P

HYPANTE, or HYPERPANTE, a name given by the Greeks to the feaſt of the preſentation of Jeſus in the temple.

This word, which ſignifies lowly or humble meeting, was given to this feaſt, from the meeting of old Simon and Anna the propheteſs in the temple, when Jeſus was brought thither.

HYPECUM, *wild* CUMIN, in botany, a genus of the tetrandria digynia claſs. The calix conſiſts of two leaves, and the corolla of four petals, the two outermoſt of which are broader, and divided into three ſegments. There are four ſpecies, none of them natives of Britain.

HYPERBATON, in grammar, a figurative conſtruction inverting the natural and proper order of words and ſentences.

HYPERBOLA. See CONIC SECTIONS.

HYPERBOLE, in rhetoric, a figure, whereby the truth and reality of things are exceſſively either enlarged or diminiſhed.

An object uncommon with reſpect to ſize, either very great of its kind or very little, ſtrikes us with ſurpriſe; and this emotion forces upon the mind a momentary conviction that the object is greater or leſs than it is in reality: the ſame effect, preciſely, attends figurative grandeur or littleneſs; and hence the hyperbole, which expreſſes this momentary conviction. A writer, taking advantage of this natural deluſion, enriches his deſcription greatly by the hyperbole: and the reader, even in his cooleſt moments, reliſhes this figure, being ſenſible that it is the operation of nature upon a warm fancy.

It cannot have efcaped obfervation, that a writer is generally more fuccefsful in magnifying by a hyperbole than in diminifhing The reafon is, that a minute object contracts the mind, and fetters its powers of imagination; but that the mind, dilated and inflamed with a grand object, moulds objects for its gratification with great facility. Longinus, with refpect to a diminifhing hyperbole, cites the following ludicrous thought from a comic poet: "He was owner of a bit of ground not larger than a Lacedemonian letter." But, for the reafon now given, the hyperbole has by far the greater force in magnifying objects; of which take the following examples:

> For all the land which thou feeft, to thee will I give it, and to thy feed for ever. And I will make thy feed as the duft of the earth: fo that if a man can number the duft of the earth, then fhall thy feed alfo be numbered. *Genefis* xiii. 15. 16.

> Illa vel intactæ fegetis per fumma volaret
> Gramina: nec teneras curfu læfiffet ariftas.
> *Æneid.* vii. 808.

> ———Atque imo barathri ter gurgite vaftos
> Sorbet in abruptum fluctus, rurfufque fub auras
> Erigit alternos, et fidera verberat unda.
> *Æneid.* iii. 421.

> ———Horrificis juxta tonat Ætna ruinis,
> Interdumque atram prorumpit ad æthera nubem,
> Turbine fumantem piceo et candente favilla:
> Attollitque globos flammarum, et fidera lambit.
> *Æneid.* iii. 571.

Speaking of Polyphemus,

> ———Ipfe arduus, altaque pulfat
> Sidera. *Æneid.* iii. 619.

> ———When he fpeaks,
> The air, a charter'd libertine, is ftill.
> *Henry* V. *act* 1. *fc.* 1.

> Now fhield with fhield, with helmet helmet clos'd,
> To armour armour, lance to lance oppos'd,
> Hoft againft hoft with fhadowy fquadrons drew,
> The founding darts in iron tempefts flew,
> Victors and vanquifh'd join promifcuous cries,
> And fhrilling fhouts and dying groans arife;
> With ftreaming blood the flipp'ry fields are dy'd,
> And flaughter'd heroes fwell the dreadful tide.
> *Iliad* iv. 508.

Quintilian is fenfible that this figure is natural: "For," fays he, "not contented with truth, we naturally incline to augment or diminifh beyond it; and for that reafon the hyperbole is familiar even among the vulgar and illiterate:" and he adds, very juftly, "That the hyperbole is then proper, when the fubject of itfelf exceeds the common meafure." From thefe premiffes, one would not expect the following inference, the only reafon he can find for juftifying this figure of fpeech, "Conceditur enim amplius dicere, quia dici quantum eft, non poteft: meliufque ultra quam citra ftat oratio." (We are indulged to fay more than enough, becaufe we cannot fay enough; and it is better to be above than under.) In the name of wonder, why this flight and childifh reafoning, when immediately before he had obferved, that the hyperbole is founded on human nature? we could not refift this perfonal ftroke of criticifm; intended not againft our author, for no human creature is exempt from error, but againft the blind veneration that is paid to the ancient claffic writers, without diftinguifhing their blemifhes from their beauties.

Having examined the nature of this figure, and the principle on which it is erected; let us proceed to the rules by which it ought to be governed. And, in the firft place, it is a capital fault, to introduce an hyperbole in the defcription of an ordinary object or event; for in fuch a cafe, it is altogether unnatural, being deftitute of furprife, its only foundation. Take the following inftance, where the fubject is extremely familiar, *viz.* fwimming to gain the fhore after a fhipwreck,

> I faw him beat the furges under him,
> And ride upon their backs; he trod the water;
> Whofe enmity he flung afide, and breafted
> The furge moft fwoln that met him: his bold head
> 'Bove the contentious waves he kept, and oar'd
> Himfelf with his good arms, in lufty ftrokes
> To th' *fhore*, that o'er his wave-borne bafis bow'd,
> As ftooping to relieve him. *Tempeft, act* 2. *fc.* 1.

In the next place, it may be gathered from what is faid, that an hyperbole can never fuit the tone of any difpiriting paffion: forrow in particular will never prompt fuch a figure; and for that reafon the following hyperboles muft be condemned as unnatural:

> *K. Rich.* Aumerle, thou weep'ft, my tender-hearted coufin!
> We'll make foul weather with defpifed tears;
> Our fighs, and they, fhall lodge the fummer-corn,
> And make a dearth in this revolting land.
> *Richard* II. *act* 3. *fc.* 6.

> Draw them to Tyber's bank, and weep your tears
> Into the channel, till the loweft ftream
> Do kifs the moft exalted fhores of all.
> *Julius Cæfar, act* 1. *fc.* 1.

Thirdly, a writer, if he wifh to fucceed, ought always to have the reader in his eye: he ought in particular never to venture a bold thought or expreffion, till the reader be warmed and prepared. For this reafon, an hyperbole in the beginning of a work can never be in its place. Example:

> Jam pauca aratro jugera regiæ
> Moles relinquent. *Horat. Carm. lib.* 2. *ode* 15.

In the fourth place, the niceft point of all, is to afcertain the natural limits of an hyperbole, beyond which being overftrained it has a bad effect. Longinus, (chap. iii.) with great propriety of thought, enters a caveat againft an hyperbole of this kind: he compares it to a bowftring, which relaxes by overftraining, and produceth an effect directly oppofite to what is intended. To afcertain any precife boundary, would be difficult, if

not impracticable. We ſhall therefore only give a ſpecimen of what may be reckoned overſtrained hyperboles. No fault is more common among writers of inferior rank; and inſtances are found even among thoſe of the fineſt taſte; witneſs the following hyperbole, too bold even for an Hotſpur.

Hotſpur, talking of Mortimer:

In ſingle oppoſition hand to hand,
He did confound the beſt part of an hour
In changing hardiment with great Glendower.
Three times they breath'd, and three times did they drink,
Upon agreement, of ſwift Severn's flood;
Who then affrighted with their bloody looks,
Ran fearfully among the trembling reeds,
And hid his criſp'd head in the hollow bank,
Blood-ſtained with theſe valiant combatants.
Firſt Part Henry IV. *act* 1. *ſc.* 4.

Speaking of Henry V.

England ne'er had a King until his time:
Virtue he had, deſerving to command:
His brandiſh'd ſword did blind men with its beams:
His arms ſpread wider than a dragon's wings:
His ſparkling eyes, replete with awful fire,
More dazzled, and drove back his enemies,
Than mid-day ſun fierce bent againſt their faces.
What ſhould I ſay? his deeds exceed all ſpeech:
He never lifted up his hand, but conquer'd.
Firſt Part Henry VI. *act* 1. *ſc.* 1.

Laſtly, An hyperbole, after it is introduced with all advantages, ought to be comprehended within the feweſt words poſſible: as it cannot be reliſhed but in the hurry and ſwelling of the mind, a leiſurely view diſſolves the charm, and diſcovers the deſcription to be extravagant at leaſt, and perhaps alſo ridiculous. This fault is palpable in a ſonnet which paſſeth for one of the moſt complete in the French language: Phillis, in a long and florid deſcription, is made as far to outſhine the ſun as he outſhines the ſtars:

Le ſilence regnoit ſur la terre et ſur l'onde,
L'air devenoit ſerain et l'Olimp vermeil,
Et l'amoureux Zephir affranchi du ſomeil,
Reſſuſcitoit les fleurs d'une haleine feconde.

L'Aurore deployoit l'or de ſa treſſe blonde,
Et ſemoit de rubis le chemin du ſoleil;
Enfin ce Dieu venoit au plus grand appareil
Qu'il ſoit jamais venu pour eclairer le monde:

Quand la jeune Philis au viſage riant,
Sortant de ſon palais plus clair que l'orient,
Fit voir une lumiere et plus vive et plus belle.

Sacre flambeau du jour, n'en ſoiez point jaloux,
Vous parutes alors auſſi peu devant elle,
Que les feux de la nuit avoient fait devant vous.
Malleville.

There is in Chaucer a thought expreſſed in a ſingle line, which ſets a young beauty in a more advantageous light than the whole of this much laboured poem:

Up roſe the ſun, and up roſe Emelie.

HYPERCATALECTIC, in the Greek and Latin poetry, is applied to a verſe, which has one or two ſyllables too much, or beyond the regular and juſt meaſure: as,

Muſæ ſorores ſunt Minervæ.
Alſo,
Muſæ ſorores Palladis lugent.

HYPERICUM, *St* JOHN'S WORT, a genus of the polyadelphia polyandria claſs. The calix conſiſts of five ſegments, and the corolla of five petals; and the filaments are numerous, and bound in five bundles. There are twenty-nine ſpecies, eight of them natives of Britain.

HYPERSARCOSIS, in medicine and ſurgery, an exceſs of fleſh, or rather a fleſhy execreſcence, ſuch as thoſe generally ariſing upon the lips of wounds, *&c.*

HYPHEN, an accent or character, in grammar, implying that two words are to be joined, or connected into one compound word, and marked thus -; as, pre eſtabliſhed, five-leaved, *&c.*

Hyphens alſo ſerve to connect the ſyllables of ſuch words as are divided by the end of the line.

HYPNOTIC, in the materia medica, ſuch medicines as any way produce ſleep, whether called narcotics, hypnotics, opiates, or ſoporifics.

HYPNUM, in botany, a genus of the cryptogamia muſci claſs. There are forty two ſpecies, all natives of Britain.

HYPOCAUSTUM, among the Greeks and Romans, a ſubterraneous place, wherein was a furnace to heat the baths.

Another ſort of hypocaſtum was a kind of kiln, to heat their winter-parlours.

Among the moderns, it is that place where the fire is kept that warms a ſtove or hot-houſe.

HYPOCHAERIS, in botany a genus of the ſyngeneſia polygamia æqualis claſs. The receptacle is paleaceous; the calix is imbricated; and the pappus is plumoſe. There are four ſpecies, two of them natives of Britain, *viz.* the radicata, or long-rooted hawkweed; and the maculata, or ſpotted hawkweed.

HYPOCHONDRIA, in anatomy. See ANATOMY, p. 256.

HYPOCHONDRIAC PASSION. See MEDICINE.

HYPOCYSTIS, in pharmacy, an inſpiſſated juice, obtained from the ſeſſile aſarum, much reſembling the true Egyptian acacia.

They gather the fruit, while unripe, and expreſs the juice, which they evaporate over a very gentle fire, to the conſiſtence of an extract, and then form into cakes, and expoſe them to the ſun to dry.

Hypocyſt is an aſtringent, and that of conſiderable power; it is good againſt diarrhœas and hœmorrhages of all kinds, and may be uſed in repellent gargariſms in the manner of the acacia; but it is very rarely met with genuine in our ſhops, the german acacia being uſually ſold under its name.

HYPOGASTRIC, an appellation given to the internal branch of the iliac artery.

HYPOGASTRIUM, in anatomy. See ANATOMY. p. 256.

HYPOPHYLLOCARPODENDRON, in botany. See LEUCODENDRON.

HYPOPYON, in medicine, a collection of purulent matter under the cornea of the eye.

HYPOSTASIS, among divines, signifies a person or substance; chiefly used in speaking of the persons of the Trinity.

HYPOTHEC, in Scots law, a right of security established by law to creditors upon the goods and effects of their debtors, for payment of certain debts. See LAW, tit. 20. § 13.

HYPOTHENAR, in anatomy. See ANATOMY, p. 200.

HYPOTHENUSE, in geometry, the longest side of a right-angled triangle, or it is that side which subtends the right angle.

HYPOTHESIS, in general, denotes something supposed to be true, or taken for granted, in order to prove or illustrate a point in question.

Hypotheses, however elegant and artful, ought to be first proved by repeated observations and constant experience, before they are received as truths.

HYSSOPUS, in botany, a genus of the didynamia gymnospermia class. The inferior lip of the corolla has a small crenated segment; and the stamina are erect and distant. There are three species, none of them natives of Britain. The leaves are said to be good in asthmas, coughs, and other disorders of the lungs.

HYSTERICS, or HYSTERIC PASSION. See MEDICINE.

HYSTERON PROTERON, in grammar and rhetoric, a species of the hyperbaton, wherein the proper order of construction is so inverted, as that the part of any sentence which should naturally come first is placed last; as in this of Terence, *valet & vivit*, for *vivit & valet;* and in the following of Virgil, *moriamur & in media arma ruamus*, for *in media arma ruamus & moriamur*.

HYSTEROPHORUS. See PARTHENIUM.

HYSTRIX, in zoology, a genus of quadrupeds belonging to the order of glires, the characters of which are these: They have two fore-teeth, obliquely divided, both in the upper and under jaw, besides eight grinders; and the body is covered with quills or prickles. (See Plate CI. fig. 5.) There are four species, *viz.*

1. The cristata, or crested porcupine, has four toes on the fore-feet, five toes on the hind-feet, a crested head, a short tail, and the upper lip is divided like that of a hare. The length of the body is about two feet, and the height about two feet and a half. The porcupine is covered with prickles, some of them nine or ten inches long, and about $\frac{1}{4}$ of an inch thick. Like the hedge-hog, he rolls himself up in a globular form, in which position he is proof against the attacks of the most rapacious animals. The prickles are exceedingly sharp, and each of them has five large black and as many white rings, which succeed one another alternately from the root to the point. These quills the animal can erect or let down at pleasure; when irritated, he beats the ground with his hind feet, erects his quills, shakes his tail, and makes a considerable rattling noise with his quills.

Most authors have asserted that the porcupine, when irritated, darts his quills to a considerable distance against the enemy, and that he will kill very large animals by this means. But Mr Buffon, and some other late historians, assure that the animal possesses no such power. Mr Buffon frequently irritated the porcupine, but never saw any thing like this darting of his quills. He says indeed, that when the creature was much agitated with passion, some of the quills which adhered but slightly to the skin, would fall off, particularly from the tail; and this circumstance, he imagines, has given rise to the mistake.

The porcupine, though originally a native of Africa and the Indies, can live and multiply in the more temperate climates of Spain and Italy. Pliny, and every other natural historian since the days of Aristotle, tells us that the porcupine, like the bear, conceals itself during the winter, and that they bring forth their young in 80 days. But these circumstances remain to this day uncertain. It is remarkable, that although this animal be very common in Italy, no person has ever given us a tolerable history of it. We only know in general, that the porcupine, in a domestic state, is not a fierce or ill-natured animal; that with his foreteeth, which are strong and sharp, he can cut through a strong board; that he eats bread, fruits, roots, *&c.* that he does considerable damage when he gets into a garden; that he grows fat, like most animals, about the end of summer; and that his flesh is not bad food.

2. The prehensilis, or cuandu, has four toes on the fore-feet, five on the hind feet, and a long tail. It is considerably less than the former species, being only 17 inches long from the point of the muzzle to the origin of the tail, which is nine inches long; the legs and feet are covered with long brownish hair; the rest of the body is covered with quills interspersed with long hairs; the quills are about five inches long and about $\frac{1}{12}$ of an inch in diameter. He feeds upon birds and small animal. He sleeps in the day like the hedgehog, and searches for his food in the night. He climbs trees, and supports himself by twisting his tail round the branches. He is generally found in the high grounds of America from Brasil to Louisiana and the southern parts of Canada. His flesh is esteemed very good eating.

3. The dorsata, has four toes on the fore-feet, five on the hind-feet, and has quills only on the back, which are short, and almost hid among the long hair. He is about two feet long. He is a native of Hudson's bay. The savages eat his flesh, and make use of his skin as a fur after taking off the prickles.

4. The macroura, has five toes both on the hind and fore feet; his tail is very long, and the prickles are elevated. He is a native of Asia the East Indies.

I.

JACCA, a city and bifhop's fee of Arragon, in Spain, fixty miles north of Saragoffa: W. lon. 50′, and N. lat. 42° 50′.

JACEA. See CENTAURIA.

JACK, in mechanics, a well-known inftrument of common ufe for raifing very great weights of any kind.

The common kitchen-jack is a compound engine where the weight is the power applied to overcome the friction of the parts, and the weight with which the fpit is charged; and a fteady and uniform motion is obtained by means of the fly.

JACK-FLAG, in a fhip, that hoifted up at the fprit fail top-moft head. See FLAG.

JACK-DAW, in ornithology. See CORVUS.

JACKALL, in zoology. See CANIS.

JACOBÆA, in botany. See SENECIO.

JACOBITES, a term of reproach beftowed on the perfons, who, vindicating the doctrines of paffive obedience and non-refiftance with refpect to the arbitrary proceedings of princes, difallow of the late revolution, and affert the fuppofed rights and adhere to the interefts of the late abdicated king James and his family.

JACOBITES, in church-hiftory, a fect of Chriftians in Syria and Mefopotamia; fo called either from Jacob, a Syrian, who lived in the reign of the emperor Mauricius; or from one Jacob, a monk, who flourifhed in the year 550.

The Jacobites are of two fects, fome following the rites of the Latin church, and others continuing feparated from the church of Rome. There is alfo at prefent a divifion among the latter, who have two rival patriarchs, one of whom refides at Caramit, and the other at Derzapharan. As to their belief, they hold but one nature in Jefus Chrift; with refpect to purgatory and prayers for the dead, they are of the fame opinion as the Greeks and other eaftern Chriftians: they confecrate unleavened bread at the eucharift, and are againft confeffion, believing that it is not of divine inftitution.

JACOBUS, an ancient gold coin worth twenty-five fhillings.

JAFFA, anciently called JOPPA, is a port-town of Paleftine in Afiatic Turky, fituated thirty miles northweft of Jerufalem: E. lon. 36°, N. lat. 32° 20′.

JAFNAPATAN, a port-town at the north end of the ifland of Ceylon, in the Eaft Indies; fubject to the Dutch: E. lon. 79°, N. lat. 10°.

JAGENDORF, a city of Silefia, twelve miles northweft of Tropaw: E. lon. 17° 6′ N. lat. 50° 8′.

St JAGO, the chief of the Cape Verd iflands, in Africa, 300 miles weft of Cape Verd; fubject to Portugal: W. lon. 24°, N. lat. 15°.

St. JAGO, the capital of the ifland of Cuba, 100 miles north weft of Jamaica: W. lon. 76°, 30′, N. lat. 20°.

St. JAGO, the capital of the province of Chili, in fouth America, fituated fix miles weft of the mountains of Andes, and eighteen eaft of the Pacific ocean: W. lon. 77°, S. lat. 34°.

JAGO DE LA VEGA, or Spanifh town, the capital of Jamaica, fituated at the fouth-eaft part of the ifland, about feven miles north-weft of Port Paffage and the bay of Port Royal: E. lon. 76° 30′, N. lat. 18° 20′.

JALAP, in botany. See MIRABILIS.

JAMAICA, an ifland of America, fituated in the Atlantic ocean, between 76° and 79° of weft longitude, and between 17° and 18° odd minutes north latitude, near 5000 miles fouth-weft of England, 100 miles fouth of the ifland of Cuba, and 350 miles north of Terra Firma. The ifland lies eaft and weft, and is about 140 miles long, and 60 broad. The wind fets on the fhore almoft all the day in every part of the ifland, and off the fhore in the night; it fometimes hails, but the people there never fee froft or fnow. The produce of the ifland is chiefly fugar; but there are plantations of coffee, of the cocoa or chocolate tree, of indigo, tobacco, pepper, cotton, woods for dying, and the mahogany and machineel wood, ginger, medicinal drugs and gums. The common difeafes of the country are fevers, fluxes, and the dry gripes.

JAMANA, the chief town of a province of Arabia, alfo of the fame name: E. lon. 47° 15′, N. lat 25°.

JAMBA, a city of the hither India, and the capital of the province of the fame name, fituated 220 miles north-eaft of Delli: E. lon. 82°, N. lat. 31°.

JAMBOLIFERA, in botany, a genus of the octandria monogynia glafs. The calix has four teeth, and the corolla four funnel fhaped petals; and the ftigma is fimple. There is but one fpecies, a native of India,

IAMBUS, in ancient poetry, a fimple foot confifting of a fhort and a long fyllable, as *pios*.

JAMBY, a town on the eaft fide of the ifland of Sumatra, in the Eaft Indies, fituated in 101° E. lon. and in 1° 30′ S. lat.

JAMES, or *knights of St* JAMES, a military order in Spain, firft inftituted about the year 1170, by Ferdinand II. king of Leon and Galicia. The greateft dignity belonging to this order is grand mafter, which has been united to the crown of Spain. The knights are obliged to make proof of their defcent from families that have been noble for four generations, on both fides; they muft alfo make it appear that their faid anceftors have neither been Jews, Saracens, nor Heretics; nor have ever been called into queftion by the inquifition. The novices are obliged to ferve fix months in the galleys, and to live a month in a monaftery; they obferve the rules of St Auftin, making no vows but of poverty, obedience, and conjugal fidelity.

St JAMES's DAY, a feftival of the Chriftian church, obferved

ſerved on the 25th of July, in honour of St James the greater, ſon of Zebedee.

Epiſtle of St JAMES, a canonical book of the New Teſtament, being the firſt of the catholic or general epiſtles; which are ſo called, as not being written to one, but to ſeveral Chriſtian churches.

JAMES TOWN, once the capital of Virginia in America, and of James country, ſituated in a peninſula on the north ſide of James, or Pauhatan river, in W. lon. 76° 30′, N. lat. 37° 30′.

JANEIRO, a province of Brazil, in ſouth America, ſituated between 44° and 49° of W. lon. and between the tropic of capricorn and 22° of S. lat.

JANICAW, or JANOWITS, a town of Bohemia, ſituated forty-five miles ſouth-eaſt of Prague.

JANIZARIES, an order of the Turkiſh infantry, reputed the grand ſignior's guards, and the main ſtrength of the Ottoman army.

JANSENISTS, in church-hiſtory, a ſect of the Roman-catholics in France, who followed the opinions of Janſenius, biſhop of Ypres, and doctor of divinity of the univerſities of Louvain and Douay, in relation to grace and predeſtination.

In the year 1640, the two univerſities juſt mentioned, and particularly father Molina and father Leonard Celſus, thought fit to condemn the opinions of the Jeſuits on grace and free-will. This having ſet the controverſy on foot, Janſenius oppoſed to the doctrine of the Jeſuits the ſentiments of St Auguſtine, and wrote a treatiſe on grace, which he entitled Auguſtinus. This treatiſe was attacked by the Jeſuits, who accuſed Janſenius of maintaining dangerous and heretical opinions; and afterwards in 1642, obtained of pope Urban VIII. a formal condemnation of the treatiſe wrote by Janſenius: when the partiſans of Janſenius gave out that this bull was ſpurious, and compoſed by a perſon entirely devoted to the Jeſuits. After the death of Urban VIII. the affair of Janſeniſm began to be more warmly controverted, and gave birth to an infinite number of polemical writings concerning grace; and what occaſioned ſome mirth, was the titles which each party gave to their writings: one writer publiſhed, The torch of St Auguſtin, another found ſnuffers for St Auguſtin's torch, and father Veron formed a gag for the Janſeniſts, *&c.* In the year 1650, ſixty eight biſhops of France ſubſcribed a letter to pope innocent X. to obtain an enquiry into, and condemnation of the five following propoſitions, extracted from Janſenius's Auguſtinus: I. Some of God's commandments are impoſſible to be obſerved by the righteous, even though they endeavour with all their power to accompliſh them. II. In the ſtate of corrupted nature, we are incapable of reſiſting inward grace. III. Merit and demerit in a ſtate of corrupted nature, does not depend on a liberty which excludes neceſſity, but on a liberty which excludes conſtraint. IV. The ſemipelagians admitted the neceſſity of an inward preventing grace for the performance of each particular act, even for the beginning of faith; but they were heretics in maintaining that this grace was of ſuch a nature, that the will of man was able either to reſiſt or obey it. It is ſemipelagianiſm to ſay, that Jeſus Chriſt died, or ſhed his blood, for all mankind in general.

In the year 1652, the pope appointed a congregation for examining into the diſpute in relation to grace. In this congregation Janſenius was condemned, and the bull of condemnation, publiſhed in May 1653, filled all the pulpits in Paris with violent outcries and alarms againſt the hereſy of the Janſeniſts. In the year 1656, pope Alexander VII. iſſued out another bull, in which he condemned the five propoſitions of Janſenius. However, the Janſeniſts affirm, that theſe propoſitions are not to be found in this book; but that ſome of his enemies having cauſed them to be printed on a ſheet, inſerted them in the book, and thereby deceived the pope. At laſt Clement the XI. put an end to the diſpute by his conſtitution of July the 17. 1705; in which, after having recited the conſtitutions of his predeceſſors in relation to this affair, he declares, "That in order to pay a proper obedience to the papal conſtitutions concerning the preſent queſtion, it is neceſſary to receive them with a reſpectful ſilence." The clergy of Paris, the ſame year, approved and accepted this bull, and none dared to oppoſe it.

This is the famous bull *Unigenitus*, ſo called from its beginning with the words *Unigenitus Dei Filius*, &c. which has occaſioned ſo much confuſion in France.

JANUARY, in chronology, the firſt month of the year, ſo called from Janus, one of the ancient Roman deities painted with two faces; one whereof was ſuppoſed to look towards the new year, and the other towards the old.

JAPAN, or *iſlands of* JAPAN, are ſituated between 130° and 144° of E. lon. and between 30° and 40° N. lat.

JAPANNING, the art of varniſhing and drawing figures on wood, *&c.* in the manner as is done by the natives of Japan.

The method of preparing woods for japanning is as follows. 1. Take plaſterer's ſize, diſſolve it over the fire, and mix it with whiting finely powdered till it is of a good body, but not too thick. 2. By means of a ſtrong bruſh, lay your work over with the former mixture; and letting it dry very well, repeat this till the wood is perfectly plain, or the pores and crevices ſufficiently filled up; and when it is thoroughly dry, rub the work over with a wet rag till it is rendered as ſmooth as poſſible: this work is called water-plaining. 3. After this, waſh over the work with the thickeſt of ſeed-lac varniſh till it is very ſmooth, letting it ſtand to dry between every waſhing. 4. In a day or two's time, you may varniſh it over with black, or whatever other colour you deſign; and when it is dry, finiſh it by poliſhing. See the article VARNISH.

After the ſame manner carved figures are to be primed; alſo frames, cabinets, ſtands, tea-tables, *&c.* ſaving that theſe are not to be poliſhed, and therefore do not require ſo great a body of varniſh; but for the tops of tables, boxes, ſides of cabinets, *&c* when the wood is ordinary and rough grained, as deal, oak, *&c.* you may uſe common joiners glue diſſolved in water

water till it is fine and thin, into which put the fineſt ſaw duſt, till it is indifferently thick: then with a bruſh lay your wooden-work over with it, and when it is dry, repeat it ſo often till all the roughneſs and grain of the wood is ſufficiently hidden; and two or three days after let it be ſcraped with a ſcraper, as pear tree and olive-wood are done, to make it as ſmooth as poſſible: then varniſh it as before directed. This, if well done, might not come behind any other work either for beauty or durability; but, however, thoſe woods that are firm and cloſe-grained are chiefly to be choſen.

Method of taking off japan patterns. 1. Having laid your ground, whether black, or of any other colour, and rendered it fit for drawing; and having your draught or deſign before you on paper, either drawn or printed, do as follows. 2. Rub this draught or print all over the back ſide with whiting or fine chalk, wiping off all that whiting which lies looſe upon the paper; then laying this paper upon the table, or piece of varniſhed-work, with the whited ſide next it upon the very place where you would have that figure made, with a needle not ſharp-pointed, fixed in a wooden handle, and called a tracing-pencil, go over and trace as much of the drawing as you think proper: thus by means of the whiting, you will have the groſs form of the draught, and ſuch other lines as will be a direction to you how to perform what you would have done. 3. Having done this, if you draw in gold-ſize, uſe fine cinnabar mixed with gum-water; and with a ſmall pencil dipt into it, go over all the lines made by the chalk: this will hold it ſo as not to come off. 4. If you work your metals or colours in gum water, then trace over your deſign with gum-water mixt with gold or braſs duſt; by either of theſe ways when it is dry and finiſhed, *viz.* either in gum water or gold ſize, you may compleat and finiſh your work.

Method of japanning wood. The wood being prepared as before directed, it is japanned with black, as follows. 1. Take of the thickeſt lac-varniſh, ſix ounces; and lamp black, enough to colour it: with this waſh over your piece three times, letting it dry thoroughly between each time: again, with the ſame varniſh, waſh it over three other ſeveral times, letting it dry as before, and ruſh it ſmooth between each waſhing. 2. Then take the following: Of thickeſt ſeed-lac varniſh, ſix ounces; and venice turpentine, one ounce; waſh over your work with it ſix times, letting it ſtand twelve hours between the three firſt and the three laſt varniſhes. 3. Your work being thus far done, take the following japan-varniſh: Of the fineſt ſeed-lac varniſh, ſix ounces; of lamp black, a ſufficient quantity; mix them, and with that let your work be waſhed twelve times, ſtanding twelve hours betwixt the firſt ſix and the laſt ſix waſhings. 4 Then letting it ſtand to dry for ſix or ſeven days, poliſh it with tripoli and a rag, as before directed: but in poliſhing you muſt work at it only till it is almoſt ſmooth; and then let it ſtand by for two days: afterwards poliſh it again, almoſt enough; then let it ſtand for ſix days, after which finiſh the poliſhing of it; finally, clear it up with oil and lamp black, by which means you will have a good black japan ſcarce at all inferior to the true japan.

For a white japan. 1. Lay the ground with iſing-glaſs ſize mixed with as much whiting ſcraped into it as will make it of a proper thickneſs; with this whiten your work once over, and being thoroughly dry, do it over again; and in like manner repeat it the third time; after which let it ſtand for twelve hours, covering it from duſt; ruſh it with Dutch ruſhing as near the grain of the wood as is proper. 2. Then taking firſt iſing-glaſs ſize, and flake white, ſo much as will make the ſize of a fair body, mix them well together, and with this go over your work three ſeveral times, letting it dry between each time, and ruſh it as before. 3. Then take white ſtarch boiled in fair water, till it is ſomewhat thick, waſh over the whole work twice with it, blood-warm; letting it dry as before. 4. Letting it ſtand for a day or two, it being firſt waſhed with rectified ſpirit of wine, to clear it from the duſt, dip a pure clean pencil into the fineſt white varniſh, and do over the work ſix or ſeven times; and if this be well done, it will give a finer gloſs than if it were poliſhed: if it be not well done, poliſhing will be neceſſary, for which reaſon you muſt give it five or ſix varniſhes more. In poliſhing you muſt make uſe of the fineſt tripoli; and inſtead of lamp-black and oil, muſt uſe putty and oil, and conclude with white ſtarch mixed with oil.

Common red japan. 1. Take iſing-glaſs ſize fine vermilion, a ſufficient quantity, as much as is proper; with the former mixture do your work over four times; firſt warming it by the fire, letting it dry each time, and ruſhing it as before. 2. This being done, waſh it over eight times with ordinary ſeed lac varniſh, and let it by for twelve hours: then ruſh it again, but ſlightly, to make it look ſmooth. 3. And, laſtly, for an exquiſite outward covering, waſh it ten times with the beſt lac-ſeed varniſh; let it lie ſeven days to dry, and then poliſh it with tripoli, and clear it up with oil and lamp black.

A deeper red japan may be made by mixing fine ſanguis draconis, in powder, with the varniſh; and a pale red japan may be had by mixing ſo much white lead with it, as to make it of whatever degree of paleneſs you pleaſe.

Blue japan. 1. Take gum-water what quantity you pleaſe, and a ſufficient quantity of white lead; grind them well upon a marble; take iſing glaſs ſize what quantity you pleaſe, and the fineſt and beſt ſmalt a ſufficient quantity; mix them well together; then add to them of the white lead, ground as before, ſo much as will give it a ſufficient body; mix all together to the conſiſtence of a paint. 2. Do your work over with this mixture three or four times, till you perceive the blue to lie with a good and fair body, letting it dry thoroughly between each time: if your blue is too pale, put more ſmalt among your ſize, without any white lead, and ſo *vice verſa*. 3. Then ruſh it ſmooth, and go over it again with a ſtronger blue; and when it is dry, waſh it three times with the cleareſt iſing glaſs ſize alone, and let it ſtand for two days to dry, covering it. 4. Warm your work gently at the fire, and with a pencil varniſh it over with the fineſt white varniſh, repeating it ſeven or eight times, letting it ſtand to dry two days as before. After which repeat again the waſhes ſeven or eight times in like manner. 5 Let it now ſtand for a week, and then poliſh it as before, and clear it up with lamp black and oil.

Cheſnut-

Chefnut-coloured japan. Take indian red, grind it with ifing-glafs fize upon a porphyry-ftone, till they are as foft and as fine as butter: then mix a little white lead, which grind ftrongly; and, laftly, lamp-black, in due proportion.

A tortoife-fhell japan. Firft lay a white ground, as before directed; then with proper colours, as vermilion, auripigment, *&c.* duly mixed with turpentine-varnifh, ftreak and cloud or fhadow the white ground with any irregular fancy at pleafure, in imitation of tortoife-fhell: then let it ftand to dry. and ftriking it here and there with reddifh-yellow varnifh, mixed with a little cinnabar, cloud the work up and down, touching it up alfo with varnifh mixed with lamp or ivory black. Having done this, varnifh it five or fix times over with the fineft white varnifh, letting it dry between every wafhing.

Japanning with gold fize. The fize being laid over that part only which you intend to gild, as already directed, let it remain there till it is fo dry, that when you put your finger on it, it be glutinous and clammy, but not fo moift that the particles fhould come off with your fingers. It is in this temper that the gold is to be applied: then take a piece of wafhing leather, or the like, and wrapping it round your fore-finger, dip it in the gold duft, and rub it where your gold fize is laid; for it will ftick no where but on the fize; and if any gold-duft lies about your work, brufh it away with a fine clean varnifhing brufh. Then, with your pencil, draw that part with gold fize alfo which is defigned for your copper, and letting it dry as in the former cafe, cover it over with copper duft in the fame manner. Having done this, lay your filver-fize; and when it is dry, as before, lay on your filver-duft, as in the two former. But it is to be obferved, that the metalline colours are to be laid fucceffively one after another, letting each be covered and thoroughly dry before you enter upon a diftinct colour. After all thefe, the other colours which are not metalline are to be laid on with gum-water, referving the rock, *&c.* for the laft part of the work. Let your fize be of a due confiftence, neither too thick nor too thin, that it may run fmooth and clean. See Size.

Japanning metals with gum-water. Take gum water, put it into a muffel-fhell; with which mix fo much of your metal or colour as may give it a proper confiftence, fo that it may run fine and fmooth: having prepared and well mxed your metals and colours, lay on your defign; your gum-water being thoroughly dried, you are to run it over with fine feed-lac varnifh, and afterwards polifh and clear it.

Laying fpeckles or ftrewings on japan-work. To do this, either on outfide or infide boxes, drawers, *&c.* mix your fpeckles with ordinary lac-varnifh, fo much as may make it fit to work, but not fo thick as for colour, and mix them well with a proper brufh. Warm the work to be done gently by the fire, and with a pencil wafh it over with the former mixture; and when it is dry, repeat it again, and fo often till your fpeckles lie as thick and even as you defire. When it is thoroughly dry, go over and beautify the work three or four times with feed-lac varnifh mixt with turpentine, and fo let it dry, and the work is finifhed, except you have a mind to polifh it. But if you polifh it, you muft wafh it eight or ten times over with the beft feed-lac varnifh, letting it ftand to dry every time; and afterwards polifh it, as before directed. All forts of coloured fpeckles may be thus ufed, except thofe of filver; the laying on of which requires the beft and fineft of the lac-varnifh, or the beft white varnifh, which muft make it fit for polifhing; but if you have not a mind to pulifh it, fewer wafhes of the varnifh will be fufficient.

Japanned and laquered ware of the Eaft indies, pay duty for every 100 l. grofs value at the fale 38 l. on importation, and the drawback is 35 l. 12s. 6d. on exportation.

JASMINUM, in botany, a genus of the diandria monogynia clafs. The corolla confifts of five fegments; the berry is tricoccous; and the feed is arillated. There are fix fpecies, none of them natives of Britain.

JASPER, in natural hiftory, a genus of fcrupi, of a complex irregular ftructure, of great variety of colours, and emulating the appearance of the finer marbles, or femipellucid gems.

The great characteriftic of jafpers is, that they all readily ftrike fire with fteel, and make not the leaft effervefcence with aquafortis.

Jafpers, though commonly reckoned among the precious ftones, ought undoubtedly to be ranged among the fcrupi; being only opake cryftalline maffes, varioufly debafed with an earthy admixture: and to this laft ingredient it is that they owe all their variety of colours, as white, green, red, brown, and bluifh

The feveral kinds of nephritic ftone, and the lapus divinus or jade, are all genuine jafpers; but the hard, bright, green jafper of the Eaft Indies, feems to be the true kind. It is found in maffes of various fizes and fhapes; but the more ufual ftandard as to fize, is between four and fix inches in diameter; but there are maffes of it found of a foot or more in diameter, and others no larger than a horfe bean. It is generally fimple and unmixed; but if it be variegated at all, it is always with white; and this is difpofed not in ftreaks or veins, but in clouds. It is capable of a very fine polifh; and when the white clouds are well difpofed, is very beautiful; and, in pieces not too thick, is tolerably pellucid, when held up againft the light.

JASPONYX, in natural hiftory, the pureft horn-coloured onyx, with beautiful green zones, which are compofed of the genuine matter of the fineft jafpers. See Jasper and Onyx.

JASQUES, a port-town of Perfia, fituated on the gulph of Ormus: E. long. 58°, N. lat. 25°.

JATROPHA, the cassada plant, in botany, a genus of the monœcia monadelphia clafs. The male has no calix; the corolla confifts of one funnel-fhaped petal; and the ftamina are ten. The female has no calix; the corolla confifts of five petals; the ftyli are three, and bifid; the capfule has three cells, and contains but one feed. There are feven fpecies, none of them natives of Britain.

JAVA, an ifland of the Eaft Indies, fituated between 102° and 113° of E. longitude, and between 5° and 8°

8° of ſouth latitude; being about 700 miles long from eaſt to weſt, and one hundred broad.

JAVELIN, in antiquity, a ſort of ſpear, five feet and an half long; the ſhaft of which was of wood, with a ſteel point.

Every ſoldier, in the Roman armies, had ſeven of theſe; which were very light and ſlender.

JAUNDICE, in medicine. See MEDICINE.

JAW, in anatomy. See ANATOMY, p. 159.

JAWER, a city of Sileſia, capital of the duchy of Jawer, ſituated in 16° 12′ E. long, and 51° 8′ N. lat.

JAZY, a city of European Turky, capital of Moldavia, ſituated on the river Pruth, in E. long. 28° 40′, N. lat. 47° 15.

IBERIS, in botany, a genus of the tetradynamia ſiliculoſa claſs. The corolla is irregular, the two outmoſt petals being largeſt; and the pod is emarginated, and contains many ſeeds. There are twelve ſpecies, only one of which, *viz.* the medicaulis or rock-creſſe, is a native of Britain.

IBEX, in zoology. See CAPRA.

IBIS, in ornithology. See TANTALUS.

ICE, in phyſiology, a ſolid, traſparent, and brittle body, formed of ſome fluid, particularly water, by means of cold. See FROST and FREEZING.

The younger Lemery obſerves, that ice is only a re-eſtabliſhment of the parts of water in their natural ſtate; that the mere abſence of fire is ſufficient to account for this re-eſtabliſhment; and that the fluidity of water is a real fuſion, like that of metals expoſed to the fire; differing only in this, that a greater quantity of fire is neceſſary to the one than the other. Gallileo was the firſt that obſerved ice to be lighter than the water which compoſed it: and hence it happens, that ice floats upon water, its ſpecific gravity being to that of water as eight to nine. This rarefaction of ice is owing to the air-bubbles produced in the water by freezing; and being conſiderably large in proportion to the water frozen, render the body ſo much ſpecifically lighter: and theſe air-bubbles growing large, acquire a great expanſive power, ſo as to burſt the containing veſſels, though ever ſo ſtrong.

ICE-HOUSE, a building contrived to preſerve ice for the uſe of a family in the ſummer-ſeaſon.

Ice-houſes are more generally uſed in warm countries than with us; particularly in Italy, where the meaneſt perſon who rents a houſe, has his vault or cellar for ice.

As to the ſituation, it ought to be placed upon a dry ſpot of ground; becauſe where-ever there is moiſture, the ice will melt: therefore in all ſtrong lands which retain the wet, too much pains cannot be taken to make drains all round them. The place ſhould alſo be elevated, and as much expoſed to the ſun and air as poſſible.

As to the figure of the building, that may be according to the fancy of the owner; but a circular form is moſt proper for the well in which the ice is to be preſerved, which ſhould be of a ſize and depth proportionable to the quantity to be kept; for it is proper to have it large enough to contain ice for two years conſumption, ſo that if a mild winter ſhould happen, in which little or no ice is to be had, there may be a ſtock to ſupply the want. At the bottom of the well, there ſhould be a ſpace of about two feet deep, left to receive any moiſture that may drain from the ice; over this ſpace ſhould be placed a ſtrong wooden grate, and from thence a ſmall drain ſhould be laid under ground, to carry off the wet. The ſides of the well ſhould be built with brick or ſtone, at leaſt two bricks thick; for the thicker it is, the leſs danger there will be of the well being affected by any external cauſe. When the well is brought up within three feet of the ſurface, there ſhould be another outer-arch or wall begun, which ſhould be carried up to the height of the top of the intended arch of the well; and if there be a ſecond arch turned over this wall, it will add to the goodneſs of the houſe: the roof muſt be high enough above the inner arch to admit of a door-way to get out the ice. If the building is to be covered with ſlates or tiles, reeds ſhould be laid conſiderably thick under them, to keep out the ſun and external air; and if theſe reeds are laid the thickneſs of ſix or eight inches, and plaſtered over with lime and hair, there will be no danger of the heat getting through them. The external wall may be built in what form the proprietor pleaſes; and as theſe ice-houſes are placed in gardens, they are ſometimes ſo contrived as to have an handſome alcove-ſeat in front, with a ſmall door behind it, through which a perſon might enter to take out the ice; and a large door on the other ſide, fronting the north, with a porch wide enough for a ſmall cart to back, in order to ſhoot down the ice near the mouth of the well, which need not be more than two feet diameter, and a ſtone ſo contrived as to ſhut it up in the exacteſt manner: all the vacant ſpace above and between this and the large door ſhould be filled up with barley-ſtraw. The building thus finiſhed, ſhould have time to dry before the ice is put into it.

It is to be obſerved, that upon the wooden grate, at the bottom of the well, there ſhould be laid ſome ſmall faggots; and if upon theſe a layer of reeds is placed ſmooth for the ice to lie upon, it will be better than ſtraw, which is commonly uſed. As to the choice of the ice, the thinner it is, the eaſier it may be broken to powder; for the ſmaller it is broken, the better it will unite when put into the well. In putting it in, care muſt be taken to ram it as cloſe as poſſible; and alſo to allow a vacancy of two inches, all round, next the ſide of the well, to give paſſage to any moiſture occaſioned by the melting of ſome of the ice. When the ice is put into the well, if a little ſalt-petre be mixed with it at every ten inches or a foot in thickneſs, it will cauſe it to unite more cloſely into a ſolid maſs.

ICHNEUMON, in zoology. See VIVERRA.

ICHNEUMON is alſo the name of a genus of flies, of the hymenoptera order. It has no tongue; the antennæ have above thirty joints; the abdomen, in moſt of the ſpecies, is petiolated; and it has a ſting in the tail incloſed in a double-valved cylindrical ſheath. There are

are feventy-feven fpecies, principally diftinguifhed by their colour.

ICHNOGRAPHY, in perfpective, the view of any thing cut off by a plain parallel to the horizon, juft at the bafe of it.

Among painters, it fignifies a defcription of images, or of ancient ftatues of marble and copper, of bufts and femi-bufts, of paintings in frefco, mofaic works, and ancient pieces of miniature.

ICHOGLANS, the grand fignior's pages ferving in the feraglio.

Thofe are the children of Chriftian parents, either taken in war, purchafed, or prefents from the viceroys and governors of diftant provinces: they are the moft fprightly, beautiful and well-made that can be met with; and are always reviewed and approved of by the grand fignior himfelf, before they are admitted into the feraglios of Pera, Conftantinople, or Adrianople, being the three colleges where they are educated, or fitted for employments, according to the opinion the court entertains of them.

ICHOR, properly fignifies a thin watery humour, like ferum: but is fometimes alfo ufed for a thicker kind, flowing from ulcers, called alfo fanies.

ICHTHYOCOLLA, ISINGLASS, a preparation from the fifh known by the name of hufo. See ACCIPENSER.

This is a tough and firm fubftance, of a whitifh colour, and in fome degree tranfparent; it is light, moderately hard, very flexile, and of fcarce any fmell, and very little tafte. We ufually receive it in twifted pieces of an oblong and rounded figure, and bent in the fhape of a horfe-fhoe: this our druggifts ufually beat and pull to pieces, and fell it in thin fhreds like fkins, which eafily diffolve: befides this kind of round ifinglafs, we meet with fome in fmall thin fquare cakes, white and very tranfparent; thefe are the fineft of all. But ifinglafs, of whatever fhape, is to be chofen clean, whitifh, and pellucid.

The method of preparing the ichthyocolla is this: they cut off all the fins of the hufo, clofe to the flefh, and take out the bladder, ftomach, and inteftines; they wafh thefe very clean, and then cut them in pieces, and throwing them into a large quantity of water, they let them fteep four and twenty hours, and after this they kindle a fire under the veffel, and keep the liquor juft boiling till the greater part of the matters are diffolved; they then ftir the whole brifkly about; then ftrain it through flannels, and fet the liquor by to cool. When there is a large quantity of fat ufually formed upon it, which is carefully fkimmed off, and the clear liquor is poured off from the groffer parts which fubfide, it is put over the fire again, and gently evaporated and fkimmed afrefh all the time, till by trials they find, that on letting a fpoonful of it cool it will harden into the confiftence of glue. Great care is taken to keep the fire very gentle, to prevent burning towards the end of this evaporation. They then pour it out upon a large, fmooth, wooden table; and as it cools, form it into the maffes we meet with it in, by cutting and rolling it up.

The greateft quantity of ifinglafs is made in Ruffia. We have it principally from Holland, the Dutch contracting for the moft of it before it is made.

It is an excellent agglutinant and ftrengthener; and is often prefcribed in jellies and broth, but rarely enters any compofitions of the regular medicinal form. It is the moft efficacious as well as the moft fafe and innocent of all the ingredients ufed for cleaning wines, upon which account the wine-coopers ufe a much greater quantity of it than the apothecaries.

A very valuable glue is alfo made of this drug, which is a proper form to keep it for the wine-coopers ufe.

ICHTHYOLOGY, the fcience of fifhes, or that branch of zoology which treats of fifhes. See NATURAL HISTORY.

ICHTHYPERIA, in natural hiftory, a name given by Dr Hill to the bony palates and mouths of fifhes, ufually met with either foffile, in fingle pieces, or in fragments. They are of the fame fubftance with the bufonitæ; and are of very various figures, fome broad and fhort, others longer and flender; fome very gibbofe, and others plainly arched. They are likewife of various fizes, from the tenth of an inch to two inches in length, and an inch in breadth.

ICOSAHEDRON, in geometry, a regular folid, confifting of twenty triangular pyramids, whofe vertexes meet in the centre of a fphere, fuppofed to circumfcribe it; and therefore, have their height and bafes equal: wherefore the folidity of one of thofe pyramids multiplied by 20, the number of bafes, gives the folid content of the icofahedron.

ICOSANDRIA, in the Linnæan fyftem of botany. See BOTANY, p. 635.

IDA, a mountain in the ifland of Candia or Crete; alfo another in Natolia, or leffer Afia, celebrated by the poets for the judgment of Paris on the beauty of the three goddeffes, Minerva, Juno, and Venus, to the laft of whom he gave the preference.

IDEA, the reflex perception of objects, after the original perception or impreffion has been felt by the mind. See METAPHYSICS.

IDENTITY, denotes that by which a thing is itfelf, and not any thing elfe; in which fenfe, indentity differs from fimilitude as well as diverfity. See METAPHYSICS.

IDES, in the ancient Roman calendar, were eight days in each month; the firft of which fell on the 15th of March, May, July, and October; and on the 13th day of the other months.

They were reckoned backwards, in the manner already explained under the article CALENDS.

Thus they called the 14th day of March, May, July, and October; and the 12th of the other months, the *pridie idus*, or the day before the ides; the next preceding day, they called the *tertio idus*; and fo on, reckoning always backwards, till they come to the nones. See NONES. This method of reckoning time is ftill retained in the chancery of Rome, and in the calendar of the breviary.

IDIOM, among grammarians, properly fignifies the peculiar

culiar genius of each language, but it is often uſed in a ſynonymous ſenſe with dialect.

IDIOPATHY, in phyſic, a diſorder peculiar to a certain part of the body, and not ariſing from any preceding diſeaſe; in which ſenſe, it is oppoſed to ſympathetic. Thus, an epilepſy is idiopathic, when it happens merely through ſome fault in the brain; and ſympathetic, when it is the conſequence of ſome other diſorder.

IDIOSYNCRASY, among phyſicians, denotes a peculiar temperament of body, whereby it is redered more liable to certain diſorders than perſons of a different conſtitution uſually are.

IDIOT, a perſon that is born a natural fool.

IDOLATRY, or the worſhip of idols, may be diſtinguiſhed into two ſorts. By the firſt, men adore the works of God, the ſun, the moon, the ſtars, angels, dæmons, men and animals: by the ſecond, men worſhip the work of their own hands, as ſtatues, pictures, and the like: and to theſe may be added a third, that by which men have worſhipped the true God under ſenſible figures and repreſentations. This indeed may have been the caſe with reſpect to each of the above kinds of idolatry; and thus the Iſraelites adored God under the figure of a calf.

The ſtars were the firſt objects of idolatrous worſhip; and on account of their beauty, their influence on the productions of the earth, and the regularity of their motions, particularly the ſun and moon, which are conſidered as the moſt glorious and reſplendent images of the Deity: afterwards, as their ſentiments became more corrupted, they began to form images, and to entertain the opinion, that by virtue of conſecration, the gods were called down to inhabit or dwell in their ſtatues. Hence Arnobius takes occaſion to rally the pagans for guarding ſo carefully the ſtatues of their gods, who, if they were really preſent in their images, might ſave their worſhippers the trouble of ſecuring them from thieves and robbers.

As to the adoration which the ancient pagans paid to the ſtatues of their gods, it is certain, that the wiſer and more ſenſible heathens conſidered them only as ſimple repreſentations or figures deſigned to recal to their minds the memory of their gods. This was the opinion of Varro and Seneca: and the ſame ſentiment is clearly laid down in Plato, who mentains, that images are inanimate, and that all the honour paid to them has reſpect to the gods whom they repreſent. But as to the vulgar, they were ſtupid enough to believe the ſtatues themſelves to be gods, and to pay divine worſhip to ſtocks and ſtones.

Soon after the flood, idolatry ſeems to have been the prevailing religion of all the world; for where-ever we caſt our eyes at the time of Abraham, we ſcarcely ſee any thing but falſe worſhip and idolatry. And it appears from ſcripture, that Abraham's forefathers, and even Abraham himſelf, were for a time idolaters.

The Hebrews were indeed expreſsly forbidden to make any repreſentation of God; they were not ſo much as to look upon an idol: and from the time of the Maccabees to the deſtruction of Jeruſalem, the Jews extended this precept to the making the figure of any man: by the law of Moſes, they were obliged to deſtroy all the images they found, and were forbidden to apply any of the gold or ſilver to their own uſe, that no one might receive the leaſt profit from any thing belonging to an idol. Of this the Jews, after they had ſmarted for their idolatry, were ſo ſenſible, that they thought it unlawful to uſe any veſſel that had been employed in ſacrificing to a falſe god, to warm themſelves with the wood of a grove, after it was cut down, or to ſhelter themſelves under its ſhade.

But the preaching of the Chriſtian religion, where-ever it prevailed, entirely rooted out idolatry; as did alſo that of Mahomet, which is built on the worſhip of one God. It muſt not, however, be forgotten, that the proteſtant Chriſtians charge thoſe of the church of Rome with paying an idolatrous kind of worſhip to the pictures or images of ſaints and martyrs: before theſe, they burn lamps and wax-candles; before theſe, they burn incenſe, and kneeling offer up their vows and petitions: they, like the pagans, believe that the ſaint to whom the image is dedicated, preſides in a particular manner about its ſhrine, and works miracles by the intervention of its image; and that if the image was deſtroyed or taken away, the ſaint would no longer perform any miracle in that place.

IDYLLION, in ancient poetry, is only a diminutive of the word [*eidos*,] and properly ſignifies any poem of moderate extent, without conſidering the ſubject. But as the collection of Theocritus's poems were called idyllia, and the paſtoral pieces being by far the beſt in that collection, the term idyllion ſeems to be now appropriated to paſtoral pieces.

JEALOUSY, in general, denotes the fear of a rival; but is more eſpecially underſtood of the ſuſpicion which married people entertain of each other's fidelity and affection.

JEDBURGH, the capital of Tiviotdale or Roxburgh, in Scotland, thirty-ſix miles ſouth-eaſt of Edinburgh: W. long. 2° 15′, N. lat. 55° 25′.

JEDDO, the capital city of Japan Proper, ſituated on the eaſt ſide of the iſland: E. long. 141° N. lat. 36°.

The ſplendor of the royal palace and public buildings of this city, in the opinion of thoſe Europeans who have ſeen it, is no where to be equalled. The emperor's palace and gardens, which are in the middle of the city, are five miles in circumference. All the houſes are built upon one floor, and the rooms are only divided by folding ſcreens.

JEER, or Jeer-rope, in a ſhip, is a large rop reeved through double or treble blocks, laſhed at the maſt-head and on the yard, in order to hoiſt or lower the yards.

JEHOVAH, one of the ſcripture names of God, ſignifying the Being who is ſelf-exiſtent and gives exiſtence to others.

So great a veneration had the Jews for this name, that they left off the cuſtom of pronouncing it, whereby its true pronunciation was forgotten. They call it tetragrammaton, or the name with four letters; and believe, that whoever knows the true pronunciation of it cannot fail to be heard by God.

JEJU-

JEJUNUM, in anatomy. See ANATOMY, p. 260.

JEMPTERLAND, a province of Sweden, bounded by Angermania on the north, by Medelpadia on the eaft, by Helfingia on the fouth, and by Norway on the weft.

JENA, a city of Germany, in the circle of Upper Saxony, and the landgraviate of Thuringia: E. lon. 11° 44′, N. lat. 51°.

JENKOPING, a city of Sweden, in the province of Gothland, fituated ninety miles fouth-eaft of Gottenburg: E. long. 14° 30′, N. 57° 30′.

JEREMIAH, *The prophecy of*, a canonical book of the Old Teftament. This divine writer was of the race of the priefts, the fon of Hilkiah of Anathoth, in the tribe of Benjamin. He was called to the prophetic office when very young, about the thirteenth of Jofiah, and continued in the difcharge of it about forty years. He was not carried captive to Babylon with the other Jews, but remained in Judea to lament the defolation of his country. He was afterwards a prifoner in Egypt with his difciple Baruch, where it is fuppofed he died in a very advanced age. Some of the Chriftian fathers tell us, he was ftoned to death by the Jews, for preaching againft their idolatry; and fome fay, he was put to death by Pharaoh Hophra, becaufe of his prophecy againft him. Part of the prophecy of Jeremiah relates to the time after the captivity of Ifrael, and before that of Judah, from the firft chapter to the forty-fourth; and part of it was in the time of the latter captivity, from the forty-fourth chapter to the end. The prophet lays open the fins of Judah with great freedom and boldnefs, and reminds them of the fevere judgments, which had befallen the ten tribes for the fame offences. He paffionately laments their misfortune, and recommends a fpeedy reformation to them. Afterwards he predicts the grievous calamities that were approaching, particularly the feventy years captivity in Chaldæa. He likewife foretells their deliverance and happy return, and the recompence which Babylon, Moab, and other enemies of the Jews fhould meet with in due time. There are likewife feveral intimations in this prophecy concerning the kingdom of the Meffiah; alfo feveral remarkable vifions, and types, and hiftorical paffages relating to thofe times. The fifty-fecond chapter does not belong to the prophecy of Jeremiah, which probably was added by Ezra, and contains a narrative of the taking of Jerufalem, and of what happened during the captivity of the Jews, to the death of Jechonias. St. Jerom has obferved upon this prophet, that his ftyle is more eafy than that of Ifaiah and Hofea; that he retains fomething of the rufticity of the village where he was born; but that he is very learned and majeftic, and equal to thofe two prophets in the fenfe of his prophecy.

JERSEY, an ifland in the Englifh channel, fifteen miles weft of the coaft of Normandy, and eighty miles fouth of Portland in Dorfetfhire: W. long. 2° 20′, N. lat. 49° 20′.

New JERSEY, a province in North America, which may be bounded on the north by a line drawn from the river Delawar to Hudfon's river, which divides it from New-York; by the Atlantic Ocean, on the eaft; by the fame ocean on the fouth; and by Delawar bay and river, which feparates it from Penfilvania, on the weft. It lies between 74° and 76° of W. long. and between 39° and 41° of N. lat. and is about 140 miles in length, and 60 in breadth. It is fubject to Britain.

JERUSALEM, the capital city of Judea, or Paleftine, in Afiatic Turky, fituated thirty miles eaft of the Levant, or Mediterranean fea, and ninety miles fouth of Damafcus: E. long. 36°, N. lat. 32°.

It ftands on a high rock, with fteep afcents on every fide, except on the north; and is furrounded with a deep valley, which is again incompaffed with hills. The city is at prefent three miles in circumference, and has a little altered its fituation: for mount Calvary, which was formerly without the walls, ftands now in the middle of the city; and mount Sion, which ftood near the centre, is now without the walls.

JESI, a city of Italy, in the province of Ancona, and territory of the pope: E. long. 14° 40′, N. lat. 43° 45′.

JESSELMERE, the capital of the province of the fame name in the Eaft Indies, fubject to the Mogul: E. long. 73° 20′, N. lat. 27°.

JESSO, or YEDSO, a country of Afia, which lies north of Japan, and is faid to extend north-eaft to the continent of America: E. long. 140°, N. lat. 40°.

JESUAT, a province of India, bounded by Patan on the north, and by Bengal on the fouth; fubject to the Mogul.

JESUITES, or the fociety of Jefus, a famous religious order in the Romifh church, founded by Ignatius Loyola, a native of Guipufcoa in Spain, who in the year 1538 affembled ten of his companions at Rome, principally chofen out of the univerfity of Paris, and made a propofal to them to form a new order; when, after many deliberations, it was agreed to add to the three ordinary vows of chaftity, poverty, and obedience, a fourth; which was, to go into all countries whither the pope fhould pleafe to fend them, in order to make converts to the Romifh church. Two years after, pope Paul III. gave them a bull, by which he approved this new order, giving them a power to make fuch ftatutes as they fhould judge convenient: on which, Ignatius was created general of the order; which in a fhort time fpread over all the countries of the world, to which Ignatius fent his companions, while he ftaid at Rome, from whence he governed the whole fociety.

The entire fociety is compofed of four forts of members; novices, fcholars, fpiritual and temporal coadjutors, and profeffed members. The novices continue fo two years; after which they are admitted to make the three fimple vows, of chaftity, poverty, and obedience, in the prefence of their fuperiors: the fcholars add fome fpiritual exercifes to their ftudies. The fpiritual coadjutors affift the profeffed members, and alfo make the three fimple vows: the temporal coajutors,

or

or lay-brothers, take care of the temporal affairs of the ſociety; and the profeſſed members, which compoſe the body of the ſociety, beſides the three ſimple vows, add a ſpecial vow of obedience to the head of the church in every thing relating to miſſions among idolaters and heretics. They have profeſſed houſes for their profeſſed members and their coadjutors; colleges, in which the ſciences are taught to ſtrangers; and ſeminaries, in which the young Jeſuits go through a courſe of philoſophy and theology. They are governed by a general, who has four aſſiſtants, and who appoints rectors, ſuperiors of houſes, provincials, viſitors, and commiſſaries. The diſcipline of theſe houſes, and eſpecially of the colleges, was regulated by Ignatius himſelf. On account of the groſs doctrines and bad practices of the Jeſuits, the order, within theſe few years, has been ſuppreſſed in moſt Roman-catholic countries, the members baniſhed, and their goods confiſcated.

JET, in natural hiſtory, a ſolid, dry, opake, inflammable ſubſtance, found in large detached maſſes, of a fine and regular ſtructure, having a grain like that of wood, ſplitting more eaſily horizontally than in any other direction, very light, moderately hard, not fuſible, but readily inflammable, and burning a long time with a fine greeniſh flame.

It is of a fine deep black colour, very gloſſy and ſhining, except upon its ſurface, where it has been fouled by accident. When examined by the microſcope, it is found to be compoſed of a number of parallel plates, very thin, and laid cloſely upon one another. It is not ſoluble in, nor makes any efferveſcence with acids. It ſhould be choſen of the deepeſt black, of a moderate hardneſs, very light, and ſuch as will ſplit moſt evenly in an horizontal direction; this being its great characteriſtic, by which it is diſtinguiſhed from the cannel coal, which breaks equally eaſy any way.

Jet is of great uſe to perfumers, and is ſometimes preſcribed in medicine. Dioſcorides tells us, that it is an excellent emollient and diſcutient, and recommends a fumigation of it for diſeaſes of the womb; and among the eaſtern nations, it is ſtill in high repute as a cordial, a ſtrengthener, and prolonger of life.

Every pound of jet pays on importation a duty of $7\frac{70}{100}$d. and draws back $6\frac{75}{100}$d. on exportation.

JET D'EAU, a French term, frequently alſo uſed with us, for a fountain that caſts up water to a conſiderable height in the air.

JEWEL, any precious ſtone, or ornament beſet with them. See the articles DIAMOND, RUBY, &c.

JEWS, thoſe who profeſs obedience to the laws and religion of Moſes.

When a modern Jew builds an houſe, he muſt leave part of it unfurniſhed, in remembrance that the temple and Jeruſalem now lie deſolate. They lay great ſtreſs upon frequent waſhings. They abſtain from meats prohibited by the Levitical law; for which reaſon, whatever they eat muſt be dreſſed by Jews, and after a manner peculiar to themſelves. Every Jew is obliged to marry, and a man who lives to twenty unmarried, is accounted as actually living in ſin.

The Jews, it is ſaid, were formerly at the diſpoſal of the chief lord where they lived, and likewiſe all their goods. A Jew may be a witneſs by our law, being ſworn on the Old Teſtament, and taking the oaths to the government.

For a farther account of the Jew, ſee the articles CARAITES, CIRCUMCISION, LEVITES, PASSOVER, PHARISEES, RABBINS, SADDUCEES, SANHEDRIM, SYNAGOGUE, TALMUD, &c.

JEW'S EARS, in botany, See TREMELLA.

IGLAW, a town of Germany, in the province of Moravia, ſituated on the river Igla, on the frontiers of Bohemia; ſubject to the houſe of Auſtria: E. long. 15° 7′, N. lat. 49° 16′.

IGNAVUS, in zoology. See BRADYPUS.

IGNIS. See FIRE.

IGNIS-FATUUS. See WILL *with-a-wiſp*.

IGNITION, in chemiſtry, the heating metals red hot, without melting them.

IGNORANCE, the privation or abſence of knowledge.

The cauſes of ignorance, according to Locke, are chiefly theſe three. 1. Want of ideas. 2. Want of a diſcoverable connection between the ideas we have. 3. Want of tracing and examining our ideas. See METAPHYSICS.

IGUANA, in zoology. See LACERTA.

IHOR, the capital of the province of Ihor, in Malacca, near the ſouth cape of the further peninſula of India, ſubject to the Dutch: E. lon. 103°, N. lat. 3°.

ILCHESTER, a borough-town of Somerſetſhire, fourteen miles ſouth of Wells. It ſends two members to parliament.

ILEX, the HOLM-OAK, or EVER-GREEN OAK, in botany, a genus of the tetrandria tetragynia claſs. The calix has four teeth; the corolla is rotated; it has no ſtylus; and the berry contains four ſeeds. There are five ſpecies, none of them natives of Britain. The kermes of the ſhops adheres and is gathered off the branches of the ilex aquifolium. The kermes is a round grain about the bulk of a pea. Theſe grains appear full of ſmall reddiſh ovula, or animalcules, of which they are the nidus. The kermes is a grateful mild reſtringent and corroborant.

ILHEOS, or RIO DE ILHEOS, a province of Brazil in ſouth America, ſubject to Portugal. It is bounded by the bay of All-ſaints on the north, and by the Atlantic ocean on the eaſt.

ILIAC PASSION, in medicine. See MEDICINE.

ILIACUS MUSCULUS, in anatomy. See ANATOMY, p. 204.

ILIAD, the name of an ancient epic poem, the firſt and fineſt of thoſe compoſed by Homer.

The poet's deſign in the iliad was to ſhew the Greeks, who were divided into ſeveral little ſtates, how much it was their intereſt to preſerve a harmony and good underſtanding among themſelves: for which end, he ſets before them the calamities that befel their anceſtors from the wrath of Achilles, and his miſunder-

ſtanding with Agamemnon; and the advantages that afterwards accrued to them from their union. The Iliad is divided into twenty-four books, or rhapſodies, which are marked with the letters of the alphabet.

ILIUM, in anatomy. See ANAT. p. 260.

ILLENOIS, the inhabitants of a country contiguous to the illenois-lake, in Canada, in north America, which is ſituated between 88° and 93° of W. lon. and between 41° and 46° of N. lat.

ILLER, a river of Germany, which riſing in the mountains of Tyrol, runs north through Swabia, and falls into the Danube at Ulm.

ILMEN, a lake in the province of Great Novogrod, in Ruſſia, in 34° E. lon. and 58° N. lat.

ILMINSTER, a market-town of Somerſetſhire, twenty-four miles ſouth-weſt of Wells.

IMAGE, in a religious ſenſe, is an artificial repreſentation or ſimilitude of ſome perſon or thing, uſed either by way of decoration and ornament, or as an object of religious worſhip and veneration; in which laſt ſenſe, it is uſed indifferently with the word idol.

IMAGINATION, a power or faculty of the mind, whereby it conceives and forms ideas of things communicated to it by the outward organs of ſenſe. See METAPHYSICS.

IMAN, a name applied by the Mahometans to him who is head of the congregations in their moſques; and, by way of eminence, to him who has the ſupreme authority both in reſpect to ſpirituals and temporals.

IMBECILLITY, a languid, infirm ſtate of body; which, being greatly impaired, is not able to perform its uſual exerciſes and functions.

IMBIBING, the action of a dry porous body, that abſorbs or takes up a moiſt or fluid one: thus, ſugar imbibes water; a ſpunge, the moiſture of the air, *&c.*

IMBRICATED, among botaniſts. See BOTANY, p. 641.

IMENSTAT, a town of Germany, in the circle of Swabia; ſituated in E. lon. 10° 8′. N. lat. 47° 26′.

IMITATION, the acts of doing or ſtriving to copy after, or become like to, another perſon or thing.

Du Bos obſerves, that the principal merit of poems and pictures conſiſts in the imitation of ſuch objects as would have excited real paſſions; and that the paſſions which theſe imitations give riſe to, are only ſuperficial, and not ſo ſtrong as that of the object imitated, and are therefore ſoon effaced. He alſo maintains, that the imitation of tragic objects in poems and pictures, afford moſt pleaſure: we liſten, therefore, with pleaſure to thoſe unhappy men who make a recital of their misfortunes by means of a painter's pencil, or of a poet's verſes; but, as Diogenes Laertius obſerves, it would afflict us extremely, were we to hear them bewailing their ſad diſaſters in perſon.

IMMACULATE, ſomething without ſtain, chiefly applied to the conception of the holy virgin.

IMMATERIAL, ſomething devoid of matter, or that is pure ſpirit: thus God, angels, and the human ſoul, are immaterial beings.

IMMEDIATE, whatever is capable of producing an effect without the intervention of external means; thus we ſay, an immediate cauſe, in oppoſition to a mediate or remote one.

IMMENSITY, an unlimited extenſion, or which no finite and determinate ſpace, repeated ever ſo often, can equal.

IMMERSION, that act by which any thing is plunged into water or other fluid.

It is uſed in chemiſtry for a ſpecies of calcination, when any body is immerſed in a fluid to be corroded; or it is a ſpecies of lotion, as when a ſubſtance is plunged into any fluid in order to deprive it of a bad quality, or communicate to it a good one.

IMMERSION, in aſtronomy, is when a ſtar or planet is ſo near the ſun with regard to our obſervations, that we cannot ſee it; being, as it were, inveloped and hid in the rays of that luminary. It alſo denotes the beginning of an eclipſe of the moon, or that moment when the moon begins to be darkened, and to enter into the ſhadow of the earth.

IMMORTAL, that which will laſt to all eternity, as having in it no principle of alteration or corruption: thus God and the human ſoul are immortal.

IMMUNITY, a privilege or exemption from ſome office, duty, or impoſition, as an exemption from tolls, *&c.*

Immunity is more particularly underſtood of the liberties granted to cities and communities.

IMPALED, in heraldry; when the coats of a man and his wife who is not an heireſs are borne in the ſame eſcutcheon, they muſt be marſhalled in pale; the huſband's on the right ſide, and the wife's on the left: and this the heralds call baron and feme, two coats impalled.

If a man has had two wives, he may impale his coat in the middle between theirs; and if he has had more than two, they are to be marſhalled on each ſide of his in their proper order.

IMPALPABLE, that whoſe parts are ſo extremely minute that they cannot be diſtinguiſhed by the ſenſes, particularly by that of feeling.

IMPANATION, a term uſed by divines, to ſignify the opinion of the Lutherans with regard to the euchariſt, who believe that the ſpecies of bread and wine remain together with the body of our Saviour after conſecration.

IMPANNELLING, in law, ſignifies the writing down or entering into a parchment, liſt or ſchedule, the names of a jury ſummoned by the ſheriff to appear for ſuch public ſervices as juries are employed in.

IMPARLANCE, in law, a petition in court for a day to conſider or adviſe what anſwer the defendant ſhall make to the plaintiff's action; and is the continuance of the cauſe till another day, or a longer time given by the court.

IMPASTATION, the mixtion of various materials of different colours and conſiſtencies, baked or bound together with ſome cement, and hardened either by the air or by fire.

IMPATIENS, in botany, a genus of the ſyngeneſia monogynia claſs. The calix conſiſts of two leaves, and the

the corolla of five irregular petals; and the capsule has five valves. There are seven species, only one of which, *viz.* the noli-me-tangere, or touch-me-not, is a native of Britain.

IMPEACHMENT, an accusation and prosecution for treason and other crimes and misdemeanors.

IMPENETRABILITY, in philosophy, that property of body, whereby it cannot be pierced by another: thus, a body, which so fills a space as to exclude all others, is said to be impenetrable.

IMPERATIVE, one of the moods of a verb, used when we would command, intreat, or advise: thus, *go*, *read*, *take pity*, *be advised*, are imperatives in our language.

IMPERATOR, in Roman antiquity, a title of honour conferred on victorious generals, by their armies, and afterwards confirmed by the senate.

IMPERATORIA, MASTER-WORT, in botany, a genus of the pentandria digynia class. The fruit is roundish, compressed, and gibbous in the middle. There is but one species, a native of Switzerland. The root of this plant, though an excellent aromatic, has only place in the plague-water of the Edinburgh pharmacopœia.

IMPERFECT, something that is defective, or that wants some of the properties found in other beings of the same kind.

IMPERIAL, something belonging to an emperor or empire, as imperial crown, imperial chamber, imperial cities, imperial diet, *&c.*

IMPERSONAL VERB, in grammar, a verb to which the nominative of any certain person cannot be prefixed; or, as others define it, a verb destitute of the two first and primary persons, as *decet*, *oportet*, &c.

IMPERVIOUS, a thing not to be pervaded nor passed thro', either by reason of the closeness of its pores, or the particular configuration of its parts.

IMPETUS, in mechanics, the force with which one body impels or strikes another. See MECHANICS.

IMPLICATION, in law, is where something is implied, that is not expressed by the parties themselves in their deeds, contracts, and agreements.

IMPORTATION, in commerce, the bringing merchandize into a kingdom from foreign countries; in contradistinction to exportation. See EXPORTATION.

We shall here give some of the principal laws relating to the importation of goods into this kingdom. Goods imported without entry, or paying customs, are forfeited; and the lord-treasurer, the barons of the exchequer, or chief magistrates of the place where the offence was committed, or next adjoining to it, may grant a warrant to any person, who, with the assistance of a constable, may break open doors, chests, *&c.* and take thence any prohibited or unaccustomed goods; but this is to be done within one month after the offence was committed. But if false information is given, the person wrongfully accused, may recover costs and damages.

No ship or vessel arriving from beyond sea is to be above three days in sailing from Gravesend to the place of discharge on the river Thames, unless hindered by contrary winds or other impediment. And no ship bound for the port of London is to touch or stay at any place adjoining to any shore, between Gravesend and Chester-quay. True entries are to be made of all such ships lading, upon oath of the master or purser for that voyage; also where she took in her lading, where she was built, how manned, who were the owners, and who the master during the voyage. In all out-ports, ships are to come directly to the place of unlading, and make true entries as aforesaid, upon penalty of the forfeiture of 100 l.

After any ship is cleared, and the watchmen and tidesmen discharged from their attendance, if there be found on board any concealed goods that have not paid the duty inwards, the master, or other person taking charge of the ship, shall forfeit 100 l.

Porters, carmen, watermen, *&c.* assisting in landing unaccustomed goods, shall, on conviction, for the first offence, be committed to the next jail till they find security for their good behaviour; and for their second offence, they are to be committed to prison for two months, without bail or mainprize, or till they are discharged by the court of exchequer, or each of them pay 5 l. to the sheriff of the county.

No merchant-denizen shall cover a stranger's goods, but shall, by himself or agent, sign one of his bills of every entry, with the mark, number, and contents of every parcel of goods, without which no entry shall pass. And no children of aliens under the age of twenty one years, shall have entry made in their names, nor be permitted to trade.

Merchants, trading into the port of London, shall have free liberty to lade and unlade their goods at any of the lawful quays between the Tower and London-bridge, from sun-rising to sun-setting, from September 10, to March 10; and between six o' clock in the morning and six in the evening, from March 10, to September 10; giving notice thereof to the respective officers, appointed to attend the lading and unlading of goods. And such officers as shall refuse to be present shall forfeit 5 l. for every default.

To prevent combination between importers, and seizers of goods unlawfully imported or exported, none shall seize them but the officers of the customs, or such as shall be authorised so to do by the lord treasurer, under-treasurer, or a special commission from his majesty, under the great privy seal.

If any seizer of prohibited or unaccustomed goods does not make due prosecution thereof, it is lawful for the custom-house officers, or others deputed thereto, to make seizure of such goods, and they shall be, in law, adjudged the first true informers and seizers, and have the benefit thereof, notwithstanding any law and statute to the contrary.

All foreign goods permitted to be landed by bills at sight, bills at view, or suffrance, shall be landed at the most convenient quays and wharfs, as the officers of the customs shall direct; and there, or at the king's storehouse of the respective ports, shall be measured, weighed, numbered, *&c.* by the officers appointed, who shall perfect the entry, and subscribe their names to it, and the next day make their report to the customer, collector,

or comptroller; or in default thereof, ſhall forfeit 100 l.

Any merchant who ſhall import goods, ſhall have liberty to break bulk in any lawful port or quay, the maſter or purſer firſt making oath of the true contents of the ſhip's lading. No Engliſh merchant ſhall put on ſhore in Scotland or Ireland, any merchandize of the growth or produce of any of his majeſty's plantations, unleſs the ſame have been firſt landed in England, Wales, or Berwick, and paid the duties with which they are chargeable, under the penalty of forfeiting the ſhip and goods, three fourths to the king, and one fourth to the informer, or he that ſhall ſue for the ſame: but if a ſhip be diſabled, or driven into any port of Ireland, and unable to proceed on her voyage, her goods may be put on ſhore, under the hands of the principal officers of the cuſtoms there reſiding, till the goods can be put on board ſome other veſſel, to be tranſported to ſome part of England or Wales.

Natives of England or Ireland may import into England, directly from Ireland, any hemp, flax, thread, yarn and linen, of the growth and manufacture of Ireland, cuſtom-free; the chief officer ſo importing bringing a certificate from the chief office in Ireland, expreſſing the particulars of the goods, with the names and places of abode of the exporters thence, and of ſuch as have ſworn that the ſaid goods are, bona fide, of the growth and manufacture of that kingdom, and who they are conſigned to in England; and the chief officer ſhall make oath, that the ſaid goods are the ſame that are on board, by virtue of that certificate.

IMPOST, in law, ſignifies in general a tribute or cuſtom, but is more particularly applied to ſignify that tax which the crown receives for merchandizes imported into any port or haven.

IMPOSTS, in architecture, the capitals of pillars, or pilaſters, which ſupport arches.

IMPOSTHUME, in ſurgery, *&c.* See ABSCESS.

IMPOTENCE, or IMPOTENCY, in general, denotes want of ſtrength, power, or means to perform any thing.

Divines and philoſophers diſtinguiſh two ſorts of impotency; natural, and moral. The firſt is a want of ſome phyſical principle, neceſſary to an action; or where a being is abſolutely defective, or not free and at liberty to act: the ſecond only imports a great difficulty, as a ſtrong habit to the contrary, a violent paſſion, or the like.

Impotency is, more particularly, uſed for a natural inability to coition. Impotence with reſpect to men, is the ſame as ſterility in women; that is, an inability of propagating the ſpecies. There are many cauſes of impotence; as, a natural defect in the organs of generation, which ſeldom admits of a cure: accidents, or diſeaſes; and in ſuch caſes the impotence may, or may not be remedied, according as theſe are curable or otherwiſe.

IMPREGNATION, the getting a female with-child. See PREGNANCY.

The term impregnation is alſo uſed, in pharmacy, for communicating the virtues of one medicine to another, whether by mixture, coction, digeſtion, *&c.*

IMPRESSION is applied to the ſpecies of objects, which are ſuppoſed to make ſome mark or impreſſion on the ſenſes, the mind, and the memory.

The peripatetics aſſert, that bodies emit ſpecies reſembling them, which are conveyed to the common ſenſorium, and they are rendered intelligible by the active intellect; and when thus ſpiritualized, are called expreſſions, or expreſs ſpecies, as being expreſſed from the others.

IMPRESSION alſo denotes the edition of a book, regarding the mechanical part only; whereas edition, beſides this, takes in the care of the editor, who corrected or augmented the copy, adding notes, *&c.* to render the work more uſeful.

IMPROBATION, in Scots law, the name of that action brought for ſetting any deed or writing aſide upon the head of forgery. See LAW, tit. 33.

IMPROPRIATION, a parſonage or eccleſiaſtical living, the profits of which are in the hands of a layman; in which ſenſe, it ſtands diſtinguiſhed from appropriation, which is where the profits of a benefice are in the hands of a biſhop, college, *&c.* though theſe terms are now often uſed promiſcuouſly.

IMPULSE, in machanics. See MECHANICS.

IMPURITY, in the law of Moſes, is any legal defilement. Of theſe there were ſeveral ſorts; ſome were voluntary, as the touching a dead body, or any animal that died of itſelf, or any creature that was eſteemed unclean; or the touching things holy, by one who was not clean, or was not a prieſt; the touching one who had a leproſy, one who had a gonorrhœa, or who was polluted by a dead carcaſe, *&c.* Sometimes theſe impurities were involuntary, as when any one inadvertently touched bones, or a ſepulchre, or any thing polluted; or fell into ſuch diſeaſes as pollute, as the leproſy, *&c.*

IMPUTATION, in general, the charging ſomething to the account of one, which belonged to another: thus, the aſſertors of original ſin maintain, that Adam's ſin is imputed to all his poſterity.

In the ſame ſenſe, the righteouſneſs and merits of Chriſt are imputed to true believers.

INACCESSIBLE, ſomething that cannot be come at, or approached, by reaſon of intervening obſtacles, as a river, rock, *&c.* It is chiefly uſed in ſpeaking of heights and diſtances. See GEOMETRY.

INALIENABLE, that which cannot be legally alienated or made over to another: thus the dominions of the king, the revenues of the church, the eſtates of a minor, *&c.* are inalienable, otherwiſe than with a reſerve of the right of redemption.

INANIMATE, a body that has either loſt its ſoul, or that is not of a nature capable of having any.

INANITION, among phyſicians, denotes the ſtate of the ſtomach when empty, in oppoſition to repletion.

INARCHING, in gardening, is a method of grafting, commonly called grafting by approach, and is uſed when the ſtock intended to graft on, and the tree from which the graft is to be taken, ſtand ſo near, or

can

can be brought ſo near, that they may be joined together.

INAUGURATION, the coronation of an emperor or king, or the conſecration of a prelate: ſo called from the ceremonies uſed by the Romans, when they were received into the college of augurs.

INCA, or YNCA, a name given by the natives of Peru to their kings and the princes of the blood. Pedro de Cieça, in his Chronicle of Peru, gives the origin of the incas, and ſays, that that country was, for a long time, the theatre of all manner of crimes, of war, diſſention, and the moſt dreadful diſorders, till at laſt two brothers appeared, one of whom was called Mangocapa; of this perſon, the Peruvians relate many wonderful ſtories. He built the city of Cuſco, made laws, eſtabliſhed order and harmony by his wiſe regulations; and he and his deſcendents took the name of inca, which ſignifies king or great lord. Theſe incas became ſo powerful, that they rendered themſelves maſters of all the country from Paſto to Chili, and from the river Maule on the ſouth, to the river Augaſmago on the north; theſe two rivers forming the bounds of their empire, which extended above thirteen hundred leagues in length. This they enjoyed till the diviſions between inca Guaſcar and Atabalipa; which the Spaniards laying hold of, made themſelves maſters of the country, and deſtroyed the empire of the incas.

INCAMERATION, a term uſed in the chancery of Rome, for the uniting of lands, revenues, or other rights, to the pope's domain.

INCANTATION, denotes certain ceremonies, accompanied with a formula of words, and ſuppoſed to be capable of raiſing devils, ſpirits, *&c.* See CHARM, *&c.*

INCAPACITY, in the canon-law, is of two kinds: 1. The want of a diſpenſation for age in a minor, for legitimation in a baſtard, and the like: this renders the proviſion of a benefice void in its original. 2. Crimes and heinous offences, which annul proviſions at firſt valid.

INCARNATION, in theology, the act whereby the ſecond perſon of the holy Trinity aſſumed the human nature, *viz.* a true body and reaſonable ſoul, in order to accompliſh the redemption of fallen mankind.

INCARNATIVES, in ſurgery, medicines which aſſiſt nature in filling up wounds or ulcers with fleſh; or rather remove the obſtructions thereto.

INCENSE, or FRANK-INCENSE, in the materia medica, *&c.* a dry reſinous ſubſtance, known among authors by the names thus and olibanum.

Incenſe is a rich perfume, with which the ancient pagans, and the Roman Catholics ſtill, perfume their temples, altars, *&c.*

The burning of incenſe made part of the daily ſervice of the ancient Jewiſh church. The prieſts drew lots to know who ſhould offer it; the deſtined perſon took a large ſilver diſh, in which was a cenſer full of incenſe; and being accompanied by another prieſt, carrying ſome live coals from the altar, went into the temple. There, in order to give notice to the people, they ſtruck upon an inſtrument of braſs placed between the temple and the altar; and being returned to the altar, he who brought the fire left it there, and went away. Then the offerer of incenſe having ſaid a prayer or two, waited the ſignal, which was the burning of the holocauſt; immediately upon which he ſet fire to the incenſe, the whole multitude continuing all the time in prayer. The quantity of incenſe offered each day, was half a pound in the morning, and as much at night.

One reaſon of this continual burning of incenſe might be, that the multitude of victims that were continually offered up, would have made the temple ſmell like a ſlaughter-houſe, and conſequently have inſpired the comers rather with diſguſt and averſion, than awe and and reverence, had it not been overpowered by the agreeable fragrance of thoſe perfumes.

INCEST, the crime of venereal commerce between perſons who are related in a degree wherein marriage is prohibited by the law of the country.

INCH, a well known meaſure of length; being the twelfth part of a foot, and equal to three barley-corns in length.

INCIDENCE, denotes the direction in which one body ſtrikes on another. See OPTICS and MECHANICS.

INCIDENT DILIGENCE, in Scots law, a warrant granted by a lord ordinary in the court of ſeſſion, for citing witneſſes for proving any point, or for production of any writing neceſſary for preparing the cauſe for a final determination, or before it goes to a general proof.

INCISIVE, an appellation given to whatever cuts or divides: thus, the fore-teeth are called dentes inciſivi, or cutters; and medicines of an attenuating nature, incidents, or inciſive medicines.

INCLE, a kind of tape made of linen yarn.

INCLINATION, is a word frequently uſed by mathematicians, and ſignifies the mutual approach, tendency, or leaning of two lines or two planes towards each other, ſo as to make an angle.

INCLINED PLANE, in mechanics, one that makes an oblique angle with the horizon. See MECHANICS.

INCLOSURE, in huſbandry, the fence or hedge made to incloſe lands.

INCOGNITO, or INCOG, is applied to a perſon that is in any place where he would not be known: but it is more particularly applied to princes, or great men, who enter towns, or walk the ſtreets, without their ordinary train or the uſual marks of their diſtinction and quality.

INCOMBUSTIBLE, ſomething that cannot be burnt, or conſumed by fire. See ASBESTUS.

INCOMMENSURABLE, a term in geometry, uſed where two lines, when compared to each other, have no common meaſure, how ſmall ſoever, that will exactly meaſure them both. And in general, two quantities are ſaid to be incommenſurable, when no third quantity can be found that is an aliquot part of both.

INCOMMENSURABLE NUMBERS are ſuch as have no common diviſor that will divide them both equally.

INCOMPATIBLE, that which cannot ſubſiſt with another, without deſtroying it: thus cold and heat are incom-

incompatible in the fame fubject, the ftrongeft overcoming and expelling the weakeft.

INCORPORATION, in pharmacy, is much the fame as impaftation, being a reduction of dry fubftances to the confiftence of a pafte, by the admixture of fome fluid; thus pills, boles, troches, and plafters are made by incorporation. Another incorporation is, when things of different confiftences, are by digeftion reduced to one common confiftence.

INCORPOREAL, a thing, or fubftance, which has no body; as God, angels, and the foul of man.

INCORRUPTIBLE, that which cannot be corrupted.

INCRASSATING, in pharmacy, *&c.* the rendering fluids thicker by the mixture of other fubftances lefs fluid, or by the evaporation of the thinner parts.

INCUBATION, the action of a hen, or other fowl brooding on her eggs.

INCUBUS, or NIGHT-MARE, in medicine. See MEDICINE.

INCUMBENT, a clerk, or minifter who is refident on his benefice: he is called incumbent, becaufe he does, or at leaft ought, to bend his whole ftudy to difcharge the cure of his church.

INCURVATION *of the rays of light*, their bending out of a rectilinear ftraight courfe, occafioned by refraction. See OPTICS.

INCUS, in anatomy. See ANATOMY, p. 296.

INDEFINITE, that which has no certain bounds, or to which the human mind cannot affix any.

INDEFINITE, in grammar, is underftood of nouns, pronouns, verbs, participles, articles, *&c.* which are left in an uncertain indeterminate fenfe, and not fixed to any particular time, thing, or other circumftance.

INDELIBLE, fomething that cannot be cancelled, or effaced.

INDEMNITY, in law, the faving harmlefs; or, a writing to fecure one from all damage and danger that may enfue from any act.

INDENTED, in heraldry, is when the out-line of an ordinary is notched like the teeth of a faw. See Plate CII. fig. 1.

INDEPENDENTS, a fect of Proteftants in Britain and Holland, fo called from their independency on other churches, and their maintaining that each church or congregation has fufficient power to act and perform every thing relating to religious government within itfelf, and is no way fubject or accountable to other churches or their deputies.

They therefore difallow parochial and provincial fubordination, and form all their congregations upon a fcheme of co-ordinancy. But though they do not think it neceffary to affemble fynods; yet if any be held, they look on their refolutions as prudential councils, but not as decifions to which they are obliged to conform.

INDETERMINATE, in general, an appellation given to whatever is not certain, fixed, and limited; in which fenfe, it is the fame with indefinite.

INDEX, in arithmetic and algebra, fhews to what power any quantity is involved, and is otherwife called exponent.

INDIA PROPER, or HITHER INDIA, a large peninfula in Afia, bounded on the north by Ufbec Tartary, and Thibet; on the eaft, by another part of Thibet, the kingdom of Afem, Ava, and Pegu; on the fouth, by the bay of Bengal, and the Indian ocean; and by the fame ocean and Perfia on the weft: fituated between 66° and 92° of eaft longitude, and between 7° and 40° of north latitude; being about 2000 miles in length from north to fouth, and 1500 miles in breadth from eaft to weft where broadeft; though the fouthern part of the peninfula is not 300 miles broad. All the country within thefe limits is either fubject or tributary to the great Mogul. It is frequently called Indoftan, a name fuppofed to be derived from the river Indus, on its weftern frontiers: it is alfo called the Mogulftan, from the imperial family now upon the throne, who trace their pedigree from Tamerlane a Mogul Tartar.

The produce of this country, and what the Europeans import from thence, is chiefly chints, callicoes, muflins, fome filk, pepper, and diamonds, which are purchafed by moft nations with filver; but the Dutch frequently barter fpices for them, which makes the India trade doubly advantageous to them.

INDIA, beyond the Ganges, is a country bounded by Thibet and Boutan on the north; by China, Tonquin, and Cochin-China on the eaft; by the Indian ocean on the fouth; and by the hither India, the bay of Bengal, and the ftraits of Malacca, on the weft: it is fituated between 92° and 104° of eaft longitude, and between the equator and 30 degrees of north latitude: being near 2000 miles in length from north to fouth, but of a very unequal breadth; in which limits are comprehended the kingdoms of Afem, Ava, Pegu, Laos, Siam, Cambodia, and Malacca, governed by as many Indian princes; only the Dutch have ufurped the dominion of Malacca. In this country there are a vaft number of elephants, and confequently a great deal of ivory; our merchants alfo meet with gold and precious ftones, canes, opium, and fuch other articles as are ufually found within the tropics.

INDIAN BERRY. See COCCULUS.

INDICATION, in phyfic, whatever ferves to direct the phyfician how to act.

INDICATIVE, in grammar, the firft mood, or manner, of conjugating a verb, by which we fimply affirm, deny, or afk fomething; as, *amant*, they love; *non amant*, they do not love; *amantne*, do they love?

INDICTION, in chronology, a cycle of fifteen years.

INDICTMENT, in Scots law, the name of the fummons or libel upon which criminals are cited before the court of Jufticiary to ftand trial.

INDIES, Eaft and Weft. See INDIA and AMERICA.

INDIGESTION, in medicine, a crudity, or want of due coction, either in the food, an humour of the body, or an excrement.

INDIGETES, a name which the ancients gave to fome of their gods.

INDIGO, in botany. See INDIGOFERA.

INDIGOFERA, in botany, a genus of the diadelphia decandria clafs. The calix is plain; the fuperior mar-

gins

gins of the alæ are connivent, and of the ſame ſhape with the vexillum; and the pod is ſtrait. There are ſix ſpecies, all of them natives of the Indies. The tinctoria, anil, or indigo, grows about two feet high, with roundiſh leaves.

As to the indigo blue, it is a fecular, or ſettling, made by means of water and oil-olive out of the leaves of the anil, or indigo plant; there is a difference between that made by the leaves only, and that which is made of the leaves and ſmall branches. The choiceſt of the former ſort is that which bears the ſurname of Serquiſſe, from a village of that name ſome leagues from Surat in the Eaſt-Indies. It is made alſo about Biana and Coſſa near Agra; and alſo in the kingdom of Golconda. In making the feculæ of anil, in order to make indigo of it, they cut the herb with a ſickle, when the leaves begin to fall upon touching them; and after they have ſtripped them from the branches, they put them into a ſufficient quantity of water in a veſſel called the ſteeping vat; and let them infuſe there thirty or thirty-five hours; after which they turn the cock, in order to let the water run off, which is become of a green colour inclining towards blue, into a veſſel of the nature of a churn, where it is worked by means of a roller or turner of wood, the ends of which are pointed and faced with iron: this they work till the water abounds with a lather; then they caſt into it a little oil of olive, that is, one pound into ſuch a quantity of the liquor as will yield ſeventy pounds of indigo, ſuch as is ſaleable; and as ſoon as the ſaid oil is thrown in, the lather ſeparates into two parts, ſo that you may obſerve a quantity curdled as milk is when ready to break; then they ceaſe working, and let it ſtand to ſettle; which when it has done ſome time, they open the pipe or cock of the veſſel, in order to let the water clear off, that the feculæ which is ſubſided may remain behind at the bottom of the veſſel like the lees of wine. Then taking it out, they put it into ſtraining bags of cloth, to ſeparate what water was left; after which they convey it into cheſts or boxes that are ſhallow, to dry it; and being dried, it is what we call indigo.

Chuſe the indigo of Serquiſſe in flat cakes, of a moderate thickneſs, neither too ſoft nor too hard, of a deep violet colour, light, and ſuch as ſwims on water, and when broken has no white ſpots in it; and laſtly, ſuch as is copperiſh or reddiſh on being rubbed with one's nail, and has the leaſt duſt and broken pieces in it.

The other ſort of indigo is alſo the feculæ made from the anil; and differs nothing from the former, but as it is made of the whole plant, ſtalk and leaf; the beſt of which kind is that which bears the name Guatimala, that comes from the Weſt Indies. In chuſing this indigo, it ſhould be as near the other kind as can be; but the ſureſt proof of its goodneſs is its burning upon the fire like wax, and leaving only a little aſhes behind. The ſecond ſort of indigo is that of St Domingo, differing nothing from the Guatimala, only that it is not of ſo lively a colour; the third is the Jamaica indigo; the fourth is that of the Leeward iſlands; all which are better or worſe, according as they are more or leſs neat and pure.

The uſe of the indigo is for the the dyer and landreſſes, ſerving the laſt to put among their linen. The painters uſe it to grind with white for painting in blue; for if it is uſed alone and neat, it turns black; ground with yellow, it makes a green: ſome confectioners and apothecaries prepoſterouſly uſe this to colour ſugars with which to make conſerves and ſyrup of violets, by adding ſome orice.

INDIVIDUAL, in logic, a particular being of any ſpecies, or that which cannot be divided into two or more beings equal or alike.

The uſual diviſion in logic is made unto genera or genus's, thoſe genera into ſpecies, and thoſe ſpecies into individuals.

INDIVISIBLE, among metaphyſicians. A thing is ſaid to be abſolutely indiviſible, that is a ſimple being, and conſiſts of no parts into which it may be divided. Thus God is indiviſible in all reſpects, as is alſo the human mind, not having extenſion or other properties of body.

INDIVISIBLES, in geometry, the elements or principles into which any body or figure may be ultimately reſolved; which elements are ſuppoſed infinitely ſmall: thus a line may be ſaid to conſiſt of points, a ſurface of parallel lines, and a ſolid of parallel and ſimilar ſurfaces.

INDORSEMENT, in law, any thing written on the back of a deed, as a receipt for money received.

There is likewiſe an indorſement, by way of aſſignment, on bills of exchange and notes of hand; which is done by writing a perſon's name on the back thereof. See BILL.

INDUCTION, in law, is putting a clerk or clergyman in poſſeſſion of a benefice or living to which he is collated, or preſented.

INDULGENCES, in the Romiſh church, are a remiſſion of the puniſhment due to ſins, granted by the church, and ſuppoſed to ſave the ſinner from Purgatory. Clement VI. in his decretal, which is generally received by the church of Rome, declares, that our Saviour has left an infinite treaſure of merits, ariſing from his own ſufferings, beſides thoſe of the bleſſed virgin and the ſaints; and that the paſtors and guides of the church, and more eſpecially the popes, who are the ſovereign diſpoſers of this treaſure, have authority to apply it to the living by virtue of the keys, and to the dead by way of ſuffrage, to diſcharge them from their reſpective proportions of puniſhment, by taking juſt ſo much merit out of this general treaſure as they conceive the debt requires, and offering it to God.

The power of granting indulgences has been greatly abuſed in the church of Rome. It was one of the chief things which the council of Conſtance laid to the charge of John XXIII. in 1415, that he impowered his legates to abſolve penitents from all ſorts of crimes, upon the payment of ſums proportionable to their guilt. Pope Leo X. in order to carry on the magnificent ſtructure of St. Peter's at Rome, publiſhed indulgences, and a plenary remiſſion to all ſuch as ſhould contribute money

money towards it. Finding the project take, he gave his ſiſter, the princeſs of Cibo, the benefit of the indulgences of Saxony and the neighbouring parts, and farmed out thoſe of other countries to the higheſt bidders, who, to make the beſt of their bargains, procured the ableſt preachers to cry up the value of the ware. "Happy times for ſinners! ſays a modern writer, "their crimes were rated, and the remiſſion of them "ſet up by auction. The apoſtolic chancery taxed "ſins at a pretty reaſonable rate. It coſt but ninety "livres and a few ducats, for crimes which people on "this ſide the Alps puniſhed with death."

It was this great abuſe of indulgences that contributed not a little to the firſt reformation of religion in Germany, where Martin Luther began firſt to declaim againſt the preachers of indulgences, and afterwards againſt indulgences themſelves: but ſince that time the popes have been more ſparing in the exerciſe of this power: however, they ſtill carry on a great trade with them to the Indies, where they are purchaſed at two rials a-piece, and ſometimes more.

The pope likewiſe grants indulgences to perſons at the point of death; that is, he grants them, by a brief, power to chuſe what confeſſor they pleaſe, who is authorized thereby to abſolve them from all their ſins in general.

INDULT, in the church of Rome, the power of preſenting to benefices granted to certain perſons by the pope. Of this kind is the indult of kings and ſovereign princes in the Romiſh communion, and that of the parliament of Paris granted by ſeveral popes. By the concordat for the abolition of the pragmatic ſanction, made between Francis I. and Leo X. in 1516, the French king has the power of nominating to biſhoprics, and other conſiſtorial benefices, within his realm. At the ſame time, by a particular bull, the pope granted him the privilege of nominating to the churches of Britany and Provence. In 1648 pope Alexander VIII. and in 1668 Clement IX. granted the king an indult for the biſhoprics of Metz, Toul, and Verdun, which had been yielded to him by the treaty of Munſter; and in 1668 the ſame pope Clement IX. granted him an indult for the benefices in the counties of Rouſillon, Artois, and the Netherlands. The cardinals likewiſe have an indult granted them by agreement between pope Paul IV. and the ſacred college in 1555, which is always confirmed by the popes at the time of their election. By this treaty the cardinals have the free diſpoſal of all the benefices depending on them, and are impowered likewiſe to beſtow a benefice in commendam.

INDULTO, a duty, tax, or cuſtom, paid to the king of Spain for all ſuch commodities as are imported from the Weſt Indies in the galleons.

INDUS, a large river of Aſia, which riſes in the mountains which ſeparate Tartary from India, and diſcharges itſelf into the India ocean.

INERTIA *of matter*, in philoſophy, is defined by Sir Iſaac Newton to be a paſſive principle by which bodies perſiſt in their motion or reſt, receive motion in proportion to the force impreſſing it, and reſiſt as much as they are reſiſted. It is alſo defined by the ſame author to be a power implanted in all matter, whereby it reſiſts any change endeavoured to be made in its ſtate. See MECHANICS.

INFALLIBLE, ſomething that cannot err, or be deceived.

One of the great controverſies between the Proteſtants and Papiſts, is the infallibility which the latter attribute to the pope; though, in fact, they themſelves are not agreed on that head, ſome placing this pretended infallibility in the pope and a general council.

INFAMY, in law, is a term which extends to forgery, perjury, groſs cheats, *&c.* by which a perſon is rendered incapable of being a witneſs or juror, even tho' he is pardoned for his crimes.

INFANT, denotes a young child. See MIDWIFERY, and MEDICINE.

INFANTE, and INFANTA, all the ſons and daughters of the kings of Spain and Portugal, except the eldeſt; the princes being called infantes, and the princeſſes infantas.

INFANTRY, in military affairs, denotes the whole body of foot-ſoldiers.

INFECTION, among phyſicians. See CONTAGION.

INFEFTMENT, in Scots law, the ſolemnity of the delivery of an heretable ſubject to the purchaſer. See LAW, tit. 10.

INFINITE, that which has neither beginning nor end: in which ſenſe God alone is infinite.

Infinite is alſo uſed to ſignify that which has had a beginning, but will have no end, as angels and human ſouls. This makes what the ſchoolmen call *infinitum a parte poſt*; as, on the contrary, by *infinitum a parte ante*, they mean that which has an end but had no beginning.

INFINITE QUANTITIES. The very idea of magnitudes infinitely great, or ſuch as exceed any aſſignable quantities, does include a negation of limits: yet if we nearly examine this notion, we ſhall find that ſuch magnitudes are not equal among themſelves, but that there are really, beſides infinite length and infinite area, three ſeveral ſort of infinite ſolidity; all of which are *quantitates ſui generis*, and that thoſe of each ſpecies are in given proportions.

Infinite length, or a line infinitely long, is to be conſidered either as beginning at a point, and ſo infinitely extended one way, or elſe both ways from the ſame point; in which caſe the one, which is a beginning infinity, is the one half of the whole, which is the ſum of the beginning and ceaſing infinity; or, as may be ſaid, of infinity *a parte ante* and *a parte poſt*, which is analogous to eternity in time and duration, in which there is always as much to follow as is paſt, from any point or moment of time; nor doth the addition or ſubduction of finite length, or ſpace of time, alter the caſe either in infinity or eternity, ſince both the one or the other cannot be any part of the whole.

INFINITESIMALS, among mathematicians, are defined to be infinitely ſmall quantities.

In

In the method of infinitefimals, the element, by which any quantity increafes or decreafes, is fuppofed to be infinitely fmall, and is generally expreffed by two or more terms, fome of which are infinitely lefs than the reft, which being neglected as of no importance, the remaining terms form what is called the difference of the propofed quantity. The terms that are neglected in this manner, as infinitely lefs than the other terms of the element, are the very fame which arife in confequence of the acceleration, or retardation, of the generating motion, during the infinitely fmall time in which the element is generated; fo that the remaining terms exprefs the elements that would have been produced in that time, if the generating motion had continued uniform: therefore thofe differences are accurately in the fame ratio to each other as the generating motions or fluxions. And hence, though in this method infinitefimal parts of the elements are neglected, the conclufions are accurately true without even an infinitely fmall error, and agree precifely with thofe that are deduced by the method by fluxions. See FLUXIONS.

INFIRMARY, a kind of hofpital, where the weak and fickly are properly taken care of.

INFLAMMABILITY, that property of bodies which difpofes them to kindle, or catch fire. See FIRE.

INFLAMMATION. See MEDICINE and SURGERY.

INFLECTION, or *Point of* INFLECTION, in the higher geometry, is a point where a curve begins to bend a contrary way.

INFLECTION, in grammar, the variation of nouns and verbs, by declenfion and conjugation.

INFLUENCE, a quality fuppofed to flow from the heavenly bodies, either with their light or heat; to which aftrologers idly afcribe all fublunary events.

INFORMATION, in law, is nearly the fame in the crown-office, as what in other courts is called a declaration. It is fometimes brought by the king, or his attorney general, or the clerk of the crown-office; and at other times by a private perfon, who informs or fues, as well for the king as himfelf, upon the breach of fome popular ftatute, in which a penalty is given to the party that will fue for it.

INFRACTION, a term chiefly ufed to fignify the violation of a treaty.

INFRA-SCAPULARIS, in anatomy. See ANATOMY, p. 196.

INFRA-SPINATUS, in anatomy. See ANATOMY, p. 195.

INFULA, in antiquity, a broad kind of fillet, made of white wool, which the priefts ufed to tie round their heads.

INFUNDIBULIFORM, in botany, an appellation given to fuch monopetalous or one-leaved flowers, as refemble a funnel in fhape, or which have a narrow tube at one end, and gradually widen towards the limb or mouth.

INFUSION, in pharmacy, a method of obtaining the virtues of plants, roots, *&c.* by fteeping them in a hot or cold liquid.

Hot infufions are made by pouring boiling water, or any other menftruum, on the drugs whofe virtues we would extract: thus, in order to obtain the common infufion of fena, take the leaves of fena, an ounce and a half; of cryftals of tartar, three drams; of the leffer cardamom-feeds hufked, two drams: boil the cryftals of tartar in a pint of water, till they are diffolved; then pour the water, while boiling hot, upon the fena and the reft; and when the liquor is cold, ftrain it off.

INGELSHEIM, a town of Germany, in the palatinate of the Rhine, eight miles fouth-weft of Mentz, E. long. 7° 40′, N. lat. 50°.

INGLUVIES, the crop or craw of graniverous birds, ferving for the immediate reception of the food, where it is macerated for fome time, before it is tranfmitted to the true ftomach.

INGOLSTAT, a town of Germany, in the circle of Bavaria, fituated on the river Danube, thirty miles weft of Ratifbon: E. long. 11° 30′, and N. lat. 48° 45′.

INGOT, a mafs of gold or filver, melted down and caft in a mould, but not coined or wrought.

INGRAFTING, in gardening. See GARDENING.

INGRESS, in aftronomy, fignifies the fun's entering the firft fcruple of one of the four cardinal figns, efpecially Aries.

INGRIA, a province of Ruffia, bounded by the lake Ladoga, the river Nieva, and the gulph of Finland on the north, by Novogorod on the eaft and fouth, and by Livonia on the weft.

INGROSSER, one who buys up great quantities of any commodity, before it comes to market, in order to raife the price.

INGUEN, in anatomy, the fame with what is otherwife called groin, or pubes.

INHERITANCE, a perpetual right or intereft in lands, invefted in a perfon and his heirs.

INHIBITION, in Scots law, a diligence obtained at the fuit of a creditor againft his debtor, prohibiting him from felling or contracting debts upon his eftate to the creditor's prejudice. See LAW, tit. 18.

INHUMATION, in chemiftry, a method of digefting fubftances by burying the veffel in which they are contained in horfe-dung or earth.

INJECTION, the forcibly throwing certain liquid medicines into the body, by means of a fyringe, tube, clyfter-pipe, or the like.

Anatomical INJECTION, the filling the veffels with fome coloured fubftance, in order to make their figures and ramifications vifible.

For this purpofe, a fine red injection is prepared thus: pour a pint of oil of turpentine on three ounces of vermilion, ftir them well together, and then ftrain all through a fine linen-cloth. If a green injection is wanted, diftilled verdigreafe may be ufed inftead of the vermilion.

A coarfe injection may be made of one pound of tallow, five ounces of white-wax, three ounces of oil of olives, melted together, and adding two ounces of venice-turpentine; and when this is diffolved, three ounces of vermilion or verdigreafe are to be throughly mixed with the other ingredients, and the whole ftrained through a linen cloth.

INJURY, any wrong done to a man's perſon, reputation, or goods.

INK, a black liquor generally made of an infuſion of galls, copperas, and a little gum arabic.

To make a very good ink for writing: take three ounces of good galls, reduced to powder; which infuſe in three pints of river or rain-water, ſetting it in the ſun or a gentle heat, for two days; then take common copperas, or green vitriol, three ounces; powder it, put it into the infuſion, and ſet it in the ſun for two days more; laſtly, ſhake it well, and add an ounce of good gum arabic.

To make the London powder-ink: take ten ounces of the cleareſt nut-galls, which reduce to a fine powder; then add two ounces of white copperas, four ounces of Roman vitriol, and of gum arabic or ſandarach an ounce; pound and ſift them very fine. This powder, though whitiſh itſelf, will, when put into water, turn it to a good black ink: an ounce of the powder ſerves to make a pint of ink.

To make a ſhining ink: take gum arabic and Roman vitriol, of each an ounce; galls well bruiſed, a pound; put them into rape-vinegar, or vinegar made of clear ſmall beer; ſet them in a warm place, ſtir them often till the liquor becomes black, and then add to a gallon of this preparation an ounce of ivory-black, and a quarter of a pint of ſeed-lac varniſh.

To make a ſhining Japan or China ink: take an ounce of lamp-black, and clarify it in an earthen pipkin to take out the droſs; two drams of indigo; half a dram of peach black; one dram of black endive, burnt; reduce them to a very fine powder, and then take a moiety of fig-leaf water, another part of milk, and a very little gum arabic; and mixing all the ingredients well together, make them up for uſe.

Printing INK is made by boiling or burning linſeed-oil till it is pretty thick, adding a little roſin to it while hot, and then mixing this varniſh with lamp-black.

INK is alſo an appellation given to any coloured liquor, uſed in the ſame manner as the atramentum or black ink; as red, green, blue, yellow, *&c.* inks.

Red ink is made thus: take wine-vinegar a pint; raſpings of brazil, one ounce; alum, half an ounce; boil them gently, and add five drams of gum arabic: diſſolve the gum, ſtrain the ingredients, and keep the liquid for uſe.

Green ink is made by boiling verdigreaſe with argol in fair water, and adding a little gum arabic.

Blue ink is made by grinding indigo with honey and the white of eggs, and making it fluid with water.

Yellow ink is made by an infuſion of ſaffron in water, with a little alum and gum arabic.

Sympathetic INK, a liquor with which a perſon may write, without the letters appearing, till ſome means be taken to render them legible.

Of this kind are the glutinous juices of plants, or any other thick and viſcid fluids, provided they have no remarkable colours themſelves; for being written on white paper, nothing will appear, till ſome fine powder of any coloured earth is thrown over the paper, whereby the letters become legible: the reaſon of this is evident, as the powder ſticks only to the letters formed by the inviſible but viſcid liquor.

Another ſort of ſympathetic inks are made of infuſions, the matter of which eaſily burns to a charcoal: thus if a ſcruple of ſal armoniac be diſſolved in two ounces of fair water, letters written therewith will be inviſible till held before the fire; for the ſal armoniac being burnt to a charcoal, by a heat not ſtrong enough to ſcorch the paper, the letters are thereby rendered viſible,

Another ſort of ſympathetic ink is made of a ſolution of lead in vinegar, and a lixivium of lime and orpiment; for if a letter be written with the former, nothing will appear: but to conceal the affair ſtill more, ſome different ſubject may be written above it, with a black ink made of burnt cork and gum-water; then, if a pice of cotton, wetted with the ſaid lixivium, be rubbed over the paper, the ſentence that was viſible will diſappear, and the inviſible one before written with the ſolution of lead will be ſeen in its place very black and ſtrong.

INN, a place appointed for the entertainment and relief of travellers.

INNS *of Court*, are colleges in London, for the ſtudy of the laws of England, with all conveniencies for the lodging and entertainment of the profeſſors and ſtudents.

The four principal inns of court are the Inner-temple, Middle-temple, Lincoln's inn, and Gray's inn; the other inns are the two ſerjeant's inns; and the others, which are leſs conſiderable, are Clifford's inn, Symond's inn, Clement's inn, Lion's inn, Furnival's inn, Staple's inn, Thavie's inn, Barnard's inn, and New-inn. Theſe are moſtly taken up by attorneys, ſolicitors, *&c.* but they belong to the inns of court, who ſend yearly ſome of their barriſters to read to them.

INN, in geography, a large river which riſes in a mountain of the Alps, in the country of the Griſons, runs north-eaſt through Tyrol and Bavaria, and diſcharges itſelf into the Danube.

INNATE IDEAS, thoſe ſuppoſed to be ſtamped on the mind from the firſt moment of its exiſtence, and which it conſtantly brings into the world with it: a doctrine, which Mr. Locke has abundantly refuted.

INNERKEITHING, a port town of Scotland, in the county of Fife, ſituated on the north ſhore of the frith of Forth, ten miles north-weſt of Edinburgh.

INNISKILLING, a ſtrong town of Ireland, in the province of Ulſter, and county of Fermanagh: W. long. 7° 50′, and N. lat. 54° 20′.

INNOCENTS DAY, a feſtival of the Chriſtian church, obſerved on December 28, in memory of the maſſacre of the innocent children by the command of Herod king of Judea; who being alarmed at hearing that an infant was born king of the Jews, and imagining that his own kingdom was in danger, ſent orders to have all the children ſlain that were in Bethlehem and the adjacent country.

The Greek church in their calendar, and the Abyſſinians of Ethiopia in their offices, commemorate fourteen thouſand infants on this occaſion.

INNOMINATA ossa, in anatomy. See Anatomy, p. 171.

INOCULATION, in medicine, the art of transplanting a distemper from one subject to another, by incision, particularly used for engrafting the small pox. See Medicine.

INOSCULATION, in anatomy. See Anastomasis.

INQUEST, in Scots law, the same with jury.

INQUISITION, in the church of Rome, a tribunal in several Roman catholic countries, erected by the popes for the examination and punishment of heretics.

This court was founded in the twelfth century by father Dominic and his followers, who were sent by pope Innocent III. with orders to excite the catholic princes and people to extirpate heretics, to search into their number and quality, and to transmit a faithful account thereof to Rome. Hence they were called inquisitors; and this gave birth to the formidable tribunal of the inquisition, which was received in all Italy, and the dominions of Spain, except the kingdom of Naples and the Low Countries.

This diabolical tribunal takes cognizance of heresy, Judaism, Mahometanism, Sodomy, and polygamy; and the people stand in so much fear of it, that parents deliver up their children, husbands their wives, and masters their servants, to its officers, without daring in the least to murmur. The prisoners are kept for a long time, till they themselves turn their own accusers, and declare the cause of their imprisonment; for they are neither told their crime, nor confronted with witnesses. As soon as they are imprisoned, their friends go into mourning, and speak of them as dead, not daring to solicit their pardon, lest they should be brought in as accomplices. When there is no shadow of proof against the pretended criminal, he is discharged, after suffering the most cruel tortures, a tedious and dreadful imprisonment, and the loss of the greatest part of his effects. The sentence against the prisoners is pronounced publicly, and with extraordinary solemnity. In Portugal they erect a theatre capable of holding three thousand persons, in which they place a rich altar, and raise seats on each side in the form of an amphitheatre. There the prisoners are placed, and over-against them is a high chair, whither they are called, one by one, to hear their doom, from one of the inquisitors.

These unhappy people know what they are to suffer, by the cloaths they wear that day. Those who appear in their own cloaths, are discharged upon payment of a fine: those who have a santo benito, or strait yellow coat without sleeves, charged with St. Andrew's cross, have their lives, but forfeit all their effects: those who have the resemblance of flames, made of red serge, sewed upon their santo benito, without any cross, are pardoned, but threatened to be burnt if ever they relapse: but those who, besides these flames, have on their santo benito their own picture, surrounded with figures of devils, are condemned to expire in the flames. The inquisitors, who are ecclesiastics, do not pronounce the sentence of death; but form and read an act, in which they say, that the criminal being convicted of such a crime, by his own confession, is with much reluctance delivered to the secular power to be punished according to his demerits: and this writing they give to the seven judges, who attend at the right side of the altar, who immediately pass sentence. For the conclusion of this horrid scene, see Act *of faith*.

INSCRIBED, in geometry. A figure is said to be inscribed in another, when all its angles touch the side or planes of the other figure.

INSCRIPTION, a title or writing carved, engraved, or affixed to any thing, to give a more distinct knowledge of it, or to transmit some important truth to posterity.

The inscriptions mentioned by Herodotus and Diodorus Siculus, sufficiently shew that this was the first method of conveying instruction to mankind, and transmitting the knowledge of history and sciences to posterity: thus the ancients engraved upon pillars both the principles of sciences, and the history of the world. Pisistratus carved precepts of husbandry on pillars of stone; and the treaties of confederacy between the Romans and Jews, were engraved on plates of brass. Hence, antiquarians have been very curious in examining the inscriptions on ancient ruins, coins, medals, *&c.*

INSECTS, in zoology, a numerous class of animals. See Natural History.

INSERTION, in anatomy, the close conjunction of the vessels, tendons, fibres, and membranes of the body with some other parts.

INSIPID, an appellation given to things without taste.

INSOLATION, in chemistry, the suffering matters to stand and digest in the heat of the sun, instead of that of a furnace.

INSOLVENT, a term applied to persons unable to pay their debts.

INSPIRATION, among divines, implies the conveying of certain extraordinary and supernatural notices or motions into the soul.

INSPISSATING, in pharmacy, an operation whereby a liquor is brought to a thicker consistence, by evaporating the thicker parts.

INSPRUCK, a city of Germany, in the circle of Austria, capital of the county of Tyrol, situated on the river Inn, in E. long. 11° 26′, N. lat. 47° 12′.

INSTALLMENT, the instating or establishing a person in some dignity.

INSTANT, such a part of duration wherein we perceive no succession; or it is that which takes up the time only of one idea in our minds.

INSTAURATION, the re establishment or restauration of a religion, a church, or the like, to its former state.

INSTEP, in the manege, is that part of a horse's hind leg which reaches from the ham to the pastern-joint.

INSTINCT, an appellation given to the sagacity and natural inclinations of brutes, which supplies the place of reason in mankind.

INSTITUTES, in literary hiftory, a book containing the elements of the Roman law, and conftitutes the laft part of the civil-law.

The Inftitutes are divided into four books, and contain an abridgment of the whole body of the civil law; being defigned for the ufe of ftudents.

INSTITUTE, in Scots law. When by difpofition, or deed of entail, a number of perfons are called to the fucceffion of an eftate one after another, the perfon firft named is called the inftitute, and the others fubftitutes. See LAW, tit. 27.

INSTITUTION, in general, fignifies the eftablifhing or founding fomething.

In the canon and common law, it fignifies the inverting a clerk with the fpiritualities of a rectory, *&c.* which is done by the bifhop, who ufes the formula, "I inftitute you rector of fuch a church, with cure of "fouls, and receive your care and mine."

INSTRUMENT, in general, whatever is fubfervient to a caufe in producing any effect.

A common cafe of mathematical inftruments contains feveral compaffes, a fector, fcale, drawing-pen, and protractor.

Notorial INSTRUMENT, in Scots law, any fact certified in writing, under the hand of a notary-public. See LAW, tit 21.

INSULATED, in architecture, an appellation given to fuch columns as ftand alone, or free from any contiguous wall, *&c.* like an ifland in the fea; whence the name.

INSURANCE, in law and commerce, a contract or agreement whereby one or more perfons, called infurers, affurers, *&c.* oblige themfelves to anfwer for the lofs of a fhip, houfe, goods, *&c.* in confideration of a premium paid by the proprietors of the things infured.

Infurances are of various kinds, as on fhips or parts of fhips, on merchandize fingly, and on fhips and goods jointly: and thefe are again branched out to run either for a time ftipulated, or to one fingle port, or out and home, with liberty to touch at the different places mentioned in the policy. Infurances may likewife be made on goods fent by land, or by hoys, *&c.* on rivers; and this is frequently done, more efpecially on jewels, and other things of great value.

The principal offices for the infurance of fhips and merchandize in London, are the Royal-exchange affurance, and the London affurance, both of which are eftablifhed by act of parliament. Thefe offices alfo infure houfes and other buildings, goods, wares, and merchandize, from lofs or damage by fire; and the former of them alfo affure lives.

The Royal-exchange infurance, on a brick or ftone building, infures any fum not exceeding 200 l. at 5s. *per ann.* and any larger fum not exceeding 1000 l. after the rate of 2 s. 6 d. *per cent. per ann.* Above 1000 l. and not exceeding 2000 l. at 3 s. *per cent.* Above 2000 l. and not exceeding 3000 l. at 4 s. *per cent.* On goods and merchandize, the property of the affured, within any brick or ftone building, or on the goods and building together, this office infures any fum not exceeding 300 l. for 7 s 6 d. *per ann.* and larger fums after the rates above-mentioned: but timber or plafter-buildings, or goods or merchandize therein, pay 8 s. *per ann.* for 200 l. and after the rate of 4 s. *per cent.* for any greater fum not exceeding 1000 l. and 5 s. *per cent.* for all infurances above 1000 l. and not exceeding 2000 l. On a timber or plafter-building with goods and merchandize together, any fum, not exceeding 300 l. may be infured for 12 s. *per ann.* and larger fums at the above rates. The goods belonging to hazardous trades, as diftillers, chemifts, apothecaries, colour-men, tallow-chandlers, oilmen, innholders, *&c.* depofited in brick houfes, pay 8 s. *per ann.* for infuring 200 l. and after the rate of 4 s. *per cent.* for any greater fum not exceeding 1000 l; and above 1000 l. and not exceeding 2000 l. 5 s. *per cent.* but when the houfes and goods are put together, the price of infurance is 4 s. *per cent. per ann.* without any other charge except the policies.

The Friendly Society infurance, has fome very extraordinary regulations; the principal of which is, that every one of the affured becomes a member of the fociety; and when any lofs happens, contributes in proportion to the fum he has infured, to make good the damage; on which account he pays only 1s. 4d. *per cent. per ann.* premium, and 6 s. 8d. *per cent.* as a caution; but what is unexpended of the 6 s. 8 d. is returned to the party infured at the end of feven years.

We have alfo infurances for lives, in virtue of which, when the perfon infured dies, a fum of money becomes payable to the perfon on whofe behalf the policy of infurance was granted. The principal infurance-office of this kind, is that of the Amicable Society for a perpetual affurance, kept in Serjeant's inn, Fleet-ftreet, London.

In this office, after paying the charges of the policy, and 10s. entrance-money, each perfon pays 5 l. *per annum*, by quarterly payments; and from thefe payments the dividends, which ufually amount to 100 l. and upwards, are to arife. All perfons admitted are to be between the ages of twelve and forty-five, and in a good ftate of health. Any perfon is allowed to have two or three infurances or numbers on the fame life, whereby fuch perfon will be intitled to a claim on each number fo infured; and every claimant is impowered to put in a new life, in the room of one deceafed, within twelve kalendar months next after the end of the current year. By becoming members of this fociety, clergymen, phyficians, lawyers, tradefmen, and all whofe income ceafes at the time of their death, may, in all probability, leave to their families a claim of not lefs than 100 l. for every 5 l. anually paid in.

INTAGLIOS, precious ftones on which are engraved the heads of great men, infcriptions, and the like; fuch as we frequently fee fet in rings, feals, *&c.*

INTEGER, in arithmetick, a whole number, in contradiftinction to a fraction.

INTERCALARY, an appellation given to the odd day inferted in leap-year; which was fo called from *calo, calare*, to proclaim, it being proclaimed by the priefts with a loud voice.

INTER-

INTERCOLUMNIATION, in architecture, denotes the ſpace between two columns, which is always to be proportioned to the height and bulk of the columns. See ARCHITECTURE.

INTERCOSTAL, in anatomy, an appellation given to ſuch muſcles, nerves, arteries and veins as lie between the ribs. See ANATOMY, Part II.

INTERDICT, an eccleſiaſtical cenſure, by which the church of Rome forbids the performance of divine ſervice in a kingdom, province, town, *&c.*

INTERDICTION, in Scots law, a legal reſtraint laid upon weak or profuſe perſons from ſigning any deed to their own prejudice, without the conſent of curators or interdictors. See SCOTS LAW, tit. 7.

INTEREST, is the premium or money paid for the loan or uſe of money; and is diſtinguiſhed into two kinds, ſimple and compound.

Simple intereſt is that which is paid for the principal, or ſum lent, at a certain rate or allowance made by law, or agreement of parties, whereby ſo much as 5 l. or 6 l. or any other ſum, is paid for 100 l. lent out for one year; and more or leſs proportionally for greater or leſſer ſums, and for more or leſs time. For example, if it is 5 l. to 100 l for one year, it is 2 l. 10 s. for half a year, and 10 l. for two years: alſo 10 l. for one year of 200 l. and 5 l. for half a year; and ſo on, for other ſums and times. Thus, as the law, or agreement of parties, fixes a certain ratio, or, as we call it, rate of intereſt, which is ſo much on the 100 l. for one year; from this we can eaſily find the proportional intereſt on 1 l. for one year, being plainly the $\frac{1}{100}$ part of the intereſt of 100 l ſo if this is 5 l. that is .05 l. if this is 6 l. that is .06 l and if this is 5 l. 10 s. or 5 5 l. that is .055 l. Wherefore, if we underſtand the rate of intereſt to be the intereſt of 1 l. for one year, the more common queſtions about ſimple intereſt will relate to theſe four things, *viz.* any principal ſum, its intereſt, the time in which it gives that intereſt, and the rate, or intereſt of 1 l. for one year; according to which, that principal, intereſt, and time, are adjuſted to one another

From which we have four problems; in the rules whereof we ſuppoſe the principal and intereſt expreſſed in the denomination of pounds, by reducing what is leſs than 1 l. to a decimal of 1 l. and the time to be expreſſed in years, and decimal parts of one year.

Prob I. Having any principal, ſum, and time, with the rates of intereſt given, to find the intereſt of that ſum for that time and rate.

Rule: Multiply the principal rate, and time, continually into one another; the product is the intereſt ſought.

Obſerve, if we expreſs the principal by p, the intereſt by n, the time by t, and the rate by r, then this rule is thus repreſented, $n=tpr$.

Example: The rate of intereſt being .05 l. what is the intereſt of 85 l. for 4 years and 3 quarters, or 4.75 years?

Anſwer. 20 l. 3 s. 9 d. $=20.1875$ l. $=85\times4.75\times.05$.

Which is thus performed:

$$\begin{array}{r} 85=p \\ 4.75=t \\ \hline 425 \\ 595 \\ 340 \\ \hline 403.75 \\ .05=r \\ \hline 20.1875 \end{array}$$

20.1875 pounds.

Which decimal is reduced by multiplying it by 20, 12, and 4: thus,

$$\begin{array}{r} .1875 \\ 20 \\ \hline 3.7500 \\ 12 \\ \hline 15000 \\ 7500 \\ \hline 9.0000 \end{array}$$

3.7500 ſhillings; 9.0000 pence

Prob. II. Having the rate, principal and intereſt, to find the time.

Rule: Divide the intereſt by the product of the rate and principal, the quote is the time: thus, $t=\frac{n}{rp}$.

Example: The rate .05 l. principal 85 l. intereſt 20 l. 3 s. 9 d. or 20.1875 l. the time is 4.75 years, or 4 ¾ years. Thus, $4.75=\frac{20.1875}{85\times.05}$, or $\frac{20.1875}{4.25}$.

Demonſtration: This rule is deduced from the former; thus, ſince $n=trp$, then dividing both ſides by rp, it is $\frac{n}{rp}=t$.

Prob. III. Having the principal, intereſt, and time, to find the rate.

Rule: Divide the intereſt by the product of principal and time, the quote is the rate: thus, $\frac{n}{tp}=r$.

Example: $n=20.1875$ l. $t=4.75$ years, $p=85$ l. then is $r=.05$ l. $=\frac{20.1875}{4.75\times85}$, or $\frac{20.1875}{403.75}$.

Demonſtration: Since $n=trp$, divide both by tp; it is $\frac{n}{tp}=r$.

Prob. IV. Having the rate, time and intereſt, to find the principal.

Rule: Divide the intereſt by the product of rate and time, the quote is the principal; thus, $\frac{n}{tr}=p$.

Example: $n=20.1875$ l. $t=4.75$ years, $r=.05$ l. then is $p=85$ l. $=\frac{20.1875}{4.75\times05}$, or $\frac{20.1875}{.2375}$.

Demonſtration: Since $n=trp$, divide both ſides by tr, the quote is $\frac{n}{tr}=p$.

Scholium: If the intereſt of any ſum for any time is added to the principal, this total or ſum is called the amount, (*viz.* of the principal and its intereſt for that time.) And then from theſe four things, *viz.* the amount, which we call a, the principal, the time, and

and rate, arise four problems; for having any three of these, the fourth may always be found. Thus,

Prob. V. Having the principal, time, and rate, to find the amount.

Rule: Find the interest by prob. I. add it to the principal, the sum is the amount.

Thus, by prob. I. the interest is ptr: therefore the amount is $a=ptr+p$. The reason is evident.

Note: Because $ptr=rt\times p$, and $p=1\times p$; therefore $rtp+p=\overline{rt+1}\times p=a$. And so the rule may be expressed thus; To the product of the rate and time add unity, and multiply the sum by the principal, the product is the amount.

Example: What is the amount of 246l. principal in 2 years and $\frac{1}{2}$, or 2.5 years, the rate of interest being .05 l? Answer 246l.+30.75 l.=276l. 15s. for the interest is$=246\times.05\times2.5=30.75$l. Or thus; $.05\times2.5=.125$l. to which add 1, it is $1+.125$ l. which multiplied by 276, produces 276.75 l.

Prob. VI. Given the principal, amount, and time, to find the rate.

Rule: Take the difference betwixt the principal and amount, and divide it by the product of the time and principal, the quote is the rate: thus, $r=\frac{a-p}{tp}$.

Example: Suppose $a=276.75$ l. $p.=246$, $t=2.5$ years; then is $r=.05$ l.$=\frac{276.75-246}{2.5\times246}=\frac{30.75}{615}$.

Demonstration: Since by prob. V. $a=trp+p$, take p from both sides, it is $a-p=trp$; then divide both by tp, it is $\frac{a-p}{tp}=r$.

Prob. VII. Given the amount, principal, and rate, to find the time.

Rule: Take the difference of the amount and principal, and divide it by the product of the principal and rate, the quote is the time: thus $t=\frac{a-p}{rp}$.

Example: Suppose $a=276.75$ l. $p=246$ l. $r=.05$; then is $t=2.5$ years$=\frac{276.75\text{ l.}-246}{246\times.05}=\frac{30.75}{12.3}$.

Demonstration: In the last problem, $a-p$ was equal to trp; and dividing both by rp, it is $\frac{a-p}{rp}=t$.

Prob. VIII. Given the amount, rate, and time, to find the principal.

Rule: Add 1 to the product of the rate and time, and by that sum divide the amount, the quote is the principal: thus, $p=\frac{a}{rt+1}$.

Example. $a=276.75$ l. $r=.05$ l. $t=2.5$ years; then is $p=246=\frac{276.75}{2.5\times.05+1}=\frac{276.75}{1.125}$.

Demonstration: By prob. V. it is $a=\overline{rt+1}\times p$; therefore dividing both sides by $\overline{rt+1}$, it is $\frac{a}{rt+1}=p$.

Compound Interest, is that which is paid for any principal sum, and the simple interest due upon it for any time, accumulated into one principal sum. Example: if 100l. is lent out for one year at 6 l. and if at the end of that year the 6l. due of interest be added to the principal, and the sum 106 l. be considered as a new principal bearing interest for the next year (or whatever less time it remains unpaid) this is called compound interest, because there is interest upon interest, which may go on by adding this second year's interest of 106 l. to the principal 106 l. and making the whole a principal for the next year.

Now, although it be not lawful to let out money at compound interest, yet in purchasing of annuities or pensions, *&c.* and taking leases in reversion, it is very usual to allow compound interest to the purchaser for his ready money; and therefore, it is very necessary to understand it.

Let therefore, as before, p=the principal put to interest; t=the time of its continuance; a=the amount of the principal and interest; R=the amount of 1 l. and its interest for one year, at any given rate, which may be thus found.

Viz. 100: 106:: 1: 1,06=the amount of 1 l. at 6 *per cent.* Or 100: 105:: 1: 1,05=the amount of 1 l. at 5 *per cent.* And so on, for any other assigned rate of interest.

Then if

R =amount of 1l. for 1 year, at any rate.
R^2=amount of 1l. for 2 years.
R^3=amount of 1l. for 3 years.
R^4=amount of 1l. for 4 years.
R^5=amount of 1l. for 5 years.

Here $t=5$. For 1 : R :: R : RR :: RR : RRR :: RRR :: R^4 : R^4: : R^5 : *&c.* in a geometrical progression continued; that is, as 1 l.: is to the amount of 1 l. at 1 years's end: : so is that amount: to the amount of 1 l. at 2 years end, *&c.* Whence it is plain, that compound interest is grounded upon a series of terms, increasing in geometrical proportion continued; wherein t (*viz.* the number of years) does always assign the index of the last and highest term, *viz.* the power of R, which is R^t.

Again, as $1 : R^t :: p : pR^t=a$ the amount of p for the time, that R^t=the amount of 1 l. That is, as 1 l.: is to the amount of 1 l. for any given time:: so is any proposed principal, or sum: to its amount for the same time.

From what has been said, we presume, the reason of the followings theorems will be very easily understood.

Theorem I. $pR^t=a$, as above.

From hence the two following theorems are easily deduced.

Theorem II. $\frac{a}{R^t}=p$.

Theorem III. $\frac{a}{p}=R^t$.

By these three theorems, all questions about compound interest may be truly resolved by the pen only, *viz.* without tables: though not so readily as by the help of tables calculated on purpose.

Example

Example I. What will 256l. 10 s. amount to in 7 years, at 5 *per cent. per annum*, compound intereſt?

Here is given $p=256.5$, $t=7$, and $R=1.05$, which being involved until its index $=t$ (*viz.* 7) will become $R^7=1.40710$. Then $1.40710\times256.5=360.92115$ $=a=$ 360 l. 18 s. 5 d. which is the anſwer required.

Example II. What principal or ſum of money muſt be put out to raiſe a ſtock of 360l. 18 s. 5 d. in ſeven years, at 5 *per cent. per annum*, compound intereſt.

Here is given $a=360.92115$, $R=5.07$ and $t=7$ to find p by theorem II. Thus $R^t=1.40710$ (360.92115 $=a$) $256.5=p$. That is, $p=$ 256l. 10 s. which is the ſum or principal required.

Example III. In what time will 256l. 10 s. raiſe a ſtock of (or amount to) 360l. 18 s. 5d. allowing 5 *per cent. per annum*, compound intereſt?

Here is given $p=256.5$, $a=360.92115$, $R=1.05$. To find t by theorem III. $R^t=\frac{a}{p}=\frac{360.92115}{256}=$ 1.40710. which being continually divided by $R=1.05$ until nothing remain, the number of thoſe diviſions will be $=7=t$.

Thus 1.05) 1.40710 (1,3400, and 1.05) (1.3400) 1.2762, and 1.05(1.2762) 1.2155, and ſo on until it becomes 1.05) 1.05 (1. which will be at the ſeventh diviſion.

Therefore it will be $t=7$, the number of years required by the queſtion.

INTERJECTION, in grammar, an indeclinable part of ſpeech, ſignifying ſome paſſion or emotion of the mind. See GRAMMAR.

INTERIM, a name given to a formulary, or kind of confeſſion of the articles of faith, obtruded upon the Proteſtants after Luther's death by the emperor Charles V. when he had defeated their forces; ſo called becauſe it was only to take place in the interim (mean time) till a general council ſhould have decided all points in diſpute between the Proteſtants and Romaniſts. It retained moſt of the doctrines and ceremonies of the Romaniſts, excepting that of marriage, which was allowed to prieſts, and communion to the laity under both kinds. Moſt of the Proteſtants rejected it. There were two other interims, one of Leipſic, the other of Franconia.

INTERLOCUTOR, in Scots law. The ſentence or judgment of a court of law, is commonly called an interlocutor before decree is extacted.

INTERLOPERS, are properly thoſe who, without due authority, hinder the trade of a company or corporation lawfully eſtabliſhed, by dealing in the ſame way.

INTERLUDE, an entertainment exhibited on the theatre between the acts of a play, to amuſe the ſpectators while the actors take breath and ſhift their dreſs, or to give time of changing the ſcenes and decorations.

INTERMITTENT, or INTERMITTING FEVERS, ſuch fevers as go off and ſoon return again, in oppoſition to thoſe which are continual. See MEDICINE.

INTEROSSEUS, in anatomy. See ANATOMY, p. 202.

INTERPOLATION, among critics, denotes a ſpurious paſſage inſerted into the writings of ſome ancient author.

INTERREGNUM, the time during which the throne is vacant in elective kingdoms; for in ſuch as are hereditary, like ours, there is no ſuch thing as an interregnum.

INTERREX, the magiſtrate who governs during an interregnum.

INTERMENT. See BURIAL.

INTERROGATION, or *Point of* INTERROGATION, in grammar, a character of this form (?) ſerving to denote a queſtion.

INTERVAL, in muſic, the difference between two ſounds, in reſpect of acute and grave; or, that imaginary ſpace terminated by two ſounds, differing in acuteneſs or gravity.

INTESTATE, in law, a perſon that dies without making a will.

INTESTINES, in anatomy. See ANATOMY, p. 259.

INTESTINAL, ſomething belonging to or ſeated in the inteſtines.

INTRIGUE, or INTREAGUE, an aſſemblage of events or circumſtances, occurring in an affair, and perplexing the perſons concerned in it.

In this ſenſe, it is uſed to ſignify the nodus or plot of a play or romance; or that point wherein the principal characters are moſt embarraſſed, through the artifice and oppoſition of certain perſons, or the unfortunate falling out of certain accidents and circumſtances.

INTRINSIC, a term applied to the inner, real, and genuine values, properties, *&c.* of any thing, in oppoſition to their extrinſic or apparent values, *&c.*

INTRUSION, in Scots law. See EJECTION.

INTUITION, among logicians, the act whereby the mind perceives the agreement or diſagreement of two ideas, immediately by themſelves, without the intervention of any other; in which caſe, the mind perceives the truth as the eye doth the light, only by being directed towards it.

INVECTED, in heraldry, denotes a thing fluted or furrowed.

Invected is juſt the reverſe of ingrailed, in which the points are turned outward to the field; whereas in invected they are turned inward to the ordinary, and the ſmall ſemicircles outward to the field. See Plate CII fig. 2.

INVECTIVE, in rhetoric, differs from reproof, as the latter proceeds from a friend, and is intended for the good of the perſon reproved; whereas the invective is the work of an enemy, and entirely deſigned to vex and give uneaſineſs to the perſon againſt whom it is directed.

INVENTION, denotes the act of finding any thing new, or even the thing thus found.

INVERARY, a parliament town of Scotland, in the county of Argyle, of which it is the capital, ſituated in Lochfin, forty five miles north-weſt of Glaſgow: W. long. 5°, N. lat 36° 28′.

INVERNESS, a parliament and port-town of Scotland, the capital of the county of Inverneſs, ſituated at the mouth of the river Neſs: W. long. 4° N. lat. 57° 46′.

INVERSE,

INVERSE, is applied to a manner of working the rule of three. See ARITHMETICK, p. 383.

INVERURY, a parliament town of Scotland, in the county of Aberdeen, fituated on the river Don, ten miles weft of Aberdeen.

INVESTIGATION, properly denotes the fearching or finding any thing out by the tracts or prints of the feet; whence mathematicians, fchoolmen, and grammarians, come to ufe the term in their refpective refearches.

INVESTITURE, in Scots law, the writings which conftitute a proper feudal right. See LAW, tit. 10.

INULA, in botany, a genus of the fyngenefia polygamia fuperflua clafs. The receptacle is naked; the pappus is fimple; and the antheræ terminate at the bafe in two briftles. There are 22 fpecies, 4 of them natives of Britain, *viz.* the helenium, or elecampane; the dyfenterica, or middle flea-bane; the pulicaria, or fmall flea-bane; and the erithmoides, or golden fampire. The root of the elecampane is faid to excite urine, and loofen the belly.

INVOCATION, in theology, the act of adoring God, and efpecially of addreffing him in prayer for his affiftance and protection.

INVOICE, an account in writing of the particulars of merchandife, with their value, cuftom, charges, *&c.* tranfmitted by one merchant to another in a diftant country. See BOOK-KEEPING, p 618.

INVOLUCRUM, among botanifts. See BOTANY, p. 637.

INVOLUTION, in algebra See ALGEBRA, p 84.

JOACHIMITES, in church-hiftory, the difciples of Joachim a ciftertian monk, who was an abbot of Flora in Calabria, and a great pretender to infpiration.

The Joachimites were particularly fond of certain ternaries: the Father, they faid, operated from the beginning till the coming of the Son; the Son, from that time to theirs, which was the year 1260; and from that time the Holy Spirit was to operate in his turn. They alfo divided every thing relating to men, to doctrine, and the manner of living, into three claffes, according to the three perfons in the Trinity.

JOANNA, one of the iflands of Comoro, fituated between the north-weft part of Madagafcar and Zanguebar, in Africa: E. long. 45°, S. lat. 12°.

JOB, or *Book of* JOB, a canonical book of the Old Teftament, containing a narrative of a feries of misfortunes which happened to a man whofe name was Job, as a trial of his virtue and patience; together with the conferences he had with his cruel friends, on the fubject of his misfortunes, and the manner in which he was reftored to eafe and happinefs. This book is filled with thofe noble, bold, and figurative expreffions, which conftitute the very foul of poetry.

Many of the Jewifh rabbins pretend that this relation is altogether a fiction: others think it a fimple narrative of a matter of fact, juft as it happened: while a third fort of critics acknowledge, that the groundwork of the ftory is true, but that it is wrote in a poetical ftrain, and decorated with peculiar circumftances, to render the narration more profitable and entertaining.

The time is not fet down in which Job lived. Some have thought that he was much ancienter than Mofes, becaufe the law is never cited by Job or his friends, and becaufe it is related that Job himfelf offered facrifices. Some imagine that this book was wrote by himfelf; others fay, that Job wrote it originally in Syriac or Arabic, and that Mofes tranflated it into Hebrew: but the rabbins generally pronounce Mofes to be the author of it, and many Chriftian writers are of the fame opinion.

JOBBER, in law, a perfon that buys and fells cattle for others. Hence ftock jobbers are perfons who buy and fell ftocks for other perfons.

IOGUIS, among the Eaft-Indians, a kind of hermits, who generally ftand under trees, or near their pagods. Some of them go ftark naked, holding their arms acrofs over their heads, and continue in that pofture all their lives: others lie on the ground, with one leg higher than the other, and their arms raifed above their head: and thefe wretched penitents infenfibly lofe the ufe of their arms and legs: fome confine themfelves in cages, fet on the top of a thick ftake, fixed in the ground; and thefe cages are fo fmall, that they put the penitent to prodigious torture: fome holding a fabre in one hand, and a kind of fhield in the other, go up a kind of crane, where hooking themfelves to an iron, which runs a confiderable way into their backs, they fpring forward into the air, flourifhing their fabres, and launching out into extravagant praifes of their idols: and others plunge into the Ganges, in hopes of being devoured by a crocodile, fancying that by this means they fhall obtain the happinefs of the next life.

Thefe miferable wretches are confidered by the Indians as perfect models of piety and holinefs: they are followed by perfons of both fexes, who make a vow of devoting themfelves to their fervice, and are wholely employed in foothing their voluntary fufferings by offering them alms and refrefhments. They call the pious to their devotions by ringing a little bell; and when they hold their fpiritual converfations, they fit clofe in a ring, and fet up a banner, made of feveral pieces of ftuff, faftened at the end of a ftick.

JOHN, or *Gofpel of St.* JOHN, a canonical book of the New Teftament, containing a recital of the life, actions, doctrine, and death of our Saviour Jefus Chrift, written by St John the apoftle and evangelift.

St. John wrote his Gofpel at Ephefus, after his return from the ifle of Patmos, at the defire of the Chriftians of Afia. St Jerom fays, he would not undertake it, but on condition they fhall appoint a public faft, to implore the affiftance of God; and that the faft being ended, St. John, filled with the Holy Ghoft, broke out into thefe words, "In the beginning was "the word," *&c.* The ancients affign two reafons for this undertaking: the firft is, becaufe, in the other three gofpels, there was wanting the hiftory of the beginning of Jefus Chrift's preaching, till the imprifonment of John the Baptift; which, therefore, he applied himfelf particularly to relate. The fecond reafon was, in order to remove the errors of the Cerinthians, Ebionites, and other fects.

St

St. John's day, the name of two Chriſtian feſtivals, one obſerved on June 24, kept in commemoration of the wonderful circumſtances attending the birth of St. John the Baptiſt; and the other on Dec. 27, in honour of St. John the Evangeliſt.

St. John's wort. See Hypericum.

St. John's, in geography, one of the Philippine iſlands, ſituated in 126° E. lon. and 7° N. lat.

St. John's, is alſo an iſland in the bay of St. Lawrence, ſituated north of New Scotland: W. lon. 65°, N. lat. 47°.

JOINERY, the art of working in wood, or of fitting various pieces of timber together.

It is called by the French *menuiſerié*, *q. d.* ſmall work, to diſtinguiſh it from carpentry, which is employed about large and leſs curious works.

JOINT, in general, denotes the juncture of two or more things.

The joints of the human body are called by anatomiſts articulations. See Anatomy, p. 148.

JOINTURE, in law, generally ſignifies a ſettlement of lands and tenements, made on a woman in conſideration of marriage.

JOINVILLE, a town of Champaign, in France, ſituated on the river Marne: E. lon. 5° 15′, and N. lat. 48° 27′.

JOISTS, or Joysts, in architecture, thoſe pieces of timber framed into the girders and ſummers, on which the boards of the floor are laid.

JONAH, or *Prophecy of* Jonah, a canonical book of the Old Teſtament; in which it is related, that Jonah was ordered to go and prophecy the deſtruction of the Ninevites; but that diſobediently attempting a voyage another way, he was diſcovered by the riſing of a ſudden tempeſt, and caſt into the ſea; where he was ſwallowed up by a whale, which, having lodged him three days and three nights in his belly, diſgorged him upon the ſhore; whereupon being ſenſible of his paſt danger and ſurpriſing deliverance, he betook himſelf to the journey and embaſſy to which he was appointed; and arriving at Nineveh, the metropolis of Aſſyria, he, according to his commiſſion, boldly laid open to the inhabitants their ſins and miſcarriages, and proclaimed their ſudden overthrow; upon which the whole city, by prayer and faſting, and a ſpeedy repentance, happily averted the divine vengeance, and eſcaped the threatened ruin.

IONIA, anciently was a province of the Leſſer Aſia, or Natolia, bounded by Etolia on the north, Lydia on the eaſt, Caria on the ſouth, and the Archipelago on the weſt.

IONIC order. See Architecture, p. 352.

Ionic dialect, in grammar, a manner of ſpeaking peculiar to the people of Ionia.

Ionic sect was the firſt of the ancient ſects of philoſophers; the others were the Italic and Eleatic. The founder of this ſect was Thales, who, being a native of Miletus in Ionia, occaſioned his followers to aſſume the appellation of Ionic: Thales was ſucceeded by Anaximander, and he by Anaximenes, both of Miletus; Anaxagoras Clazomenius ſucceeded them, and removed his ſchool from Aſia to Athens, where Socrates was his ſcholar. It was the diſtinguiſhing tenet of this ſect, that water was the principle of all natural things.

JONK, or Jonque, in naval affairs, is a kind of ſmall ſhip, very common in the Eaſt Indies: theſe veſſels are about the bigneſs of our fly-boats; and differ in the form of their building, according to the different methods of naval architecture uſed by the nations to which they belong. Their ſails are frequently made of mats, and their anchors are made of wood.

JOSHUA, a canonical book of the Old Teſtament, containing a hiſtory of the wars and tranſactions of the perſon whoſe name it bears. This book may be divided into three parts; the firſt of which is a hiſtory of the conqueſt of the land of Canaan; the ſecond, which begins at the twelfth chapter, is a deſcription of that country, and the diviſion of it among the tribes; and the third, compriſed in the two laſt chapters, contains the renewal of the covenant he cauſed the Iſraelites to make, and the death of their victorious leader and governor. The whole comprehends a term of ſeventeen, or, according to others, of twenty-ſeven years.

JOURNAL, or Day-book. See Book keeping, p. 583.

Journal, at ſea. See Navigation.

Journal is alſo a name common for weekly eſſays, news-papers, *&c.* as the Gray's Inn Journal, the Weſtminſter Journal, the Edinburgh Weekly Journal, *&c.*

JOURNEYMAN, properly one who works by the day only; but it is now uſed for any one who works under a maſter, either by the day, the year, or the piece.

IPECACUANHA, in the materia medica, a Weſt-indian root, of which there are two kinds, diſtinguiſhed by their colour, and brought from different places, but both poſſeſſing the ſame virtues, though in a different degree. The one is grey, and brought from Peru; the other is brown, and is brought from the Brazils: and theſe are indifferently ſent into Europe under the general name of ipecacuanha.

Theſe two ſorts have been by ſome ſuppoſed to be the roots of two different plants: but this is a miſtake; the only difference is, that one grows in a different place, and in a richer and moiſter ſoil, and is better ſupplied with juices than the other.

Ipecacuanha is an excellent, mild, and ſafe emetic; it is alſo a noble reſtringent; and, given in doſes too ſmall to vomit, is the greateſt of all remedies for a dyſentery. Small doſes of ipecacuanha, are an excellent remedy in diarrhœas of a more ſimple kind; and in the fluor albus we hardly know a better medicine.

IPOMÆA, in botany, a genus of the pentandria monogynia claſs. The corolla is funnel ſhaped; the ſtylus is globular; and the capſule has three cells. There are eighteen ſpecies, none of them natives of Britain.

IPSWICH, a borough and port town of Suffolk, ſituated on the river Orwel, twenty-four miles ſouth eaſt of Bury.

It ſends two members to parliament.

IRELAND, an iſland of the Atlantic ocean, ſubject to Great Britain, ſituated between 5° an 10° W. long. and between 51° and 56° N. lat. being bounded by the Northern ocean on the north, by St. George's channel, which divides it from Great Britain, on the eaſt, and by the Atlantic and Weſtern ocean on the the ſouth and weſt. This country is two hundred and fifty miles long, and one hundred and fifty broad; diſtant from Holyhead in north Wales fifty miles, and from Galloway in Scotland fifteen miles. It is divided into four large provinces, *viz.* Ulſter on the north, Leinſter on the eaſt, Munſter on the ſouth, and Connaught on the weſt.

IRIS, the RAINBOW. See OPTICS.

IRIS, in anatomy. See ANATOMY, p. 289.

IRIS, the FLOWER-DE LUCE, in botany, a genus of the triandria monogynia claſs. The corolla conſiſts of ſix diviſions, alternately reflected: the ſtigmata have the appearance of petals. There are twenty-two ſpecies, only two of which are natives of Britain, *viz.* the pſeudacorus, or yellow flower-de-luce; and the fœtidiſſima, or ſtinking gladdon. The root is cathartic, and recommended in dropſies.

IRON. See CHEMISTRY, p. 82.

IRON-SICK, in the ſea-language, is ſaid of a ſhip or boat, when her bolts or nails are ſo eaten with ruſt, and ſo worn away, that they occaſion hollows in the planks, whereby the veſſel is rendered leaky.

IRON-WORT, in botany. See SIDERITIS.

IRONY, in rhetoric, is when a perſon ſpeaks contrary to his thoughts, in order to add force to his diſcourſe; whence Quintilian calls it diverſiloquium.

IROQUOIS, the name of five nations in North America, in alliance with the Britiſh colonies. They are bounded by Canada on the north, by the Britiſh plantations of New-York and Penſilvania on the eaſt and ſouth, and by the lake Ontario on the weſt.

IRRADIATION, the act of emitting ſubtile effluvia, like the rays of the ſun, every way.

IRTIS, a great river, which runs from north to ſouth through Ruſſia, falls into the river Oby, and makes part of the boundary between Aſia and Europe.

IRWIN, a port-town of Scotland, in the bailiwic of Cunningham, ſituated at the mouth of the river Irwin, on the frith of Clyde: W. long. 4° 40′, N. lat. 55° 35′.

ISABELLA, a fortreſs of the Auſtrian Netherlands, ſituated on the weſt ſide of the river Schield, oppoſite to Antwerp: in E. long. 4° 10′, N. lat. 51° 15′.

ISAIAH, or *Prophecy of* ISAIAH, a canonical book of the Old Teſtament. Iſaiah is the firſt of the four greater prophets, the other three being Jeremiah, Ezekiel, and Daniel. This prophet was of royal blood, his father Amos being brother to Azariah king of Judah. The ſtyle of this prophet is noble, ſublime and florid. Grotius calls him the Demoſthenes of the Hebrews. He had the advantage, above the other prophets, of improving his diction by converſing with men of the greateſt parts and elocution; and this added a ſublimity, force, and majeſty to what he ſaid. He impartially reproved the vices of the age in which he lived, and openly diſplayed the judgments of God that were hanging over the Jewiſh nation; at the ſame time denouncing vengeance on the Aſſyrians, Egyptians, Ethiopians, Moabites, Edomites, Syrians, and Arabians, who were inſtrumental in inflicting thoſe judgments. He foretold the deliverance of the Jews from their captivity in Babylon, by the hands of Cyrus king of Perſia, an hundred years before it came to paſs; but the moſt remarkable of his predictions are thoſe concerning the Meſſiah, in which he not only foretold his coming in the fleſh, but all the great and memorable circumſtances of his life and death.

ISATIS, in botany, a genus of the tetradynamia ſiliquoſa claſs. The pod is lanceolated, has two valves, and contains but one ſeed. There are four ſpecies, only one of which, *viz.* the tinctoria, or woad, is a native of Britain. It is uſed by the dyers. See BOTANY, p. 634.

ISCHÆMUM, SCHOENANTH, in botany, a genus of the polygamia monœcia claſs. The calix of the hermaphrodite is a glume containing two flowers; the corolla conſiſts of two valves; it has three ſtamina, two ſtyli, and one ſeed. The calix, *&c.* of the male are the ſame with thoſe of the hermaphrodite. There are two ſpecies, both natives of the Eaſt Indies.

ISCHIUM, in anatomy. See ANAT. p. 172.

ISCHURY, in medicine, a diſeaſe conſiſting in an entire ſuppreſſion of urine. See MEDICINE.

ISENACH, a town of Germany in the circle of Upper Saxony, ſituated in E. long. 10° 12′, N. lat. 51°.

ISENARTS, a town of Germany, in the circle of Auſtria, and dukedom of Stiria, ſituated thirty-five miles north-weſt of Gratz.

ISERNIA, a town of Naples, in the province of Moliſe, ſituated in E. long. 15° 15′, N. lat. 41° 36′.

ISH, in Scots law, ſignifies *expiry*: thus we ſay, The iſh of a leaſe. It ſignifies alſo *to go out*: thus we ſay, Free iſh and entry from and to any place.

ISIA, feaſts and ſacrifices anciently ſolemniſed in honour of the goddeſs Iſis.

The Iſia were full of abominable impurities, and for that reaſon thoſe who were initiated were obliged to take an oath of ſecrecy: they held for nine days ſucceſſively; but were ſo abominable, that the ſenate aboliſhed them at Rome, under the conſulſhip of Piſo and Gabinius.

ISINGLASS. See ICHTHYOCOLLA.

ISLAND, a tract of dry land, encompaſſed with water; in which ſenſe it ſtands contradiſtinguiſhed from continent, or terra firma.

ISLE DE DIEU, an iſland in the bay of Biſcay, on the coaſt of France, ſituated fourteen miles weſt of the coaſt of Poitou.

ISLE *of France*, a province of that kingdom, in which the capital city of Paris is ſituated, being bounded by Picardy on the north, by Champain on the eaſt, by Orleans on the ſouth, and by Normandy on the weſt.

ISNARDIA, in botany, a genus of the tetrandria monogynia claſs. It has no corolla; the calix conſiſts of four diviſions; and the capſul has four cells. There is but one ſpecies, a native of France.

ISNY, a free imperial city of Germany, in the circle of Swabia, ſituated in E. long. 10°, N. lat. 47° 36′.

ISOCHRONAL, is applied to ſuch vibrations of a pendulum, as are performed in the ſame ſpace of time as all the vibrations or ſwings of the ſame pendulum are, whether the arches it deſcribes be longer or ſhorter.

ISOCHRONAL LINE, that in which a heavy body is ſuppoſed to deſcend without any acceleration.

ISOLA, a port town and biſhop's ſee of the hither Calabria, fifteen miles ſouth of St Severino.

ISOPERIMETRICAL FIGURES, in geometry, are ſuch as have equal perimeters or circumferences.

ISOPYRUM, in botany, a genus of the polyandria polygynia claſs. It has no calix; the petals are five or more; the nectarium is bilabiated, and tubular; and the capſule contains many ſeeds. There are three ſpecies, none of them natives of Britain.

ISOCELES TRIANGLE, in geometry, one that has two equal ſides.

ISPAHAN, or SPAHAWN, the capital city of Eyrac Agem, and of all Perſia: it is of an oval form, and twelve miles in circumference: E. lon. 50°, N. lat. 32° 30′.

ISPIDA, in ornithology. See ALCEDO.

ISSUES, in ſurgery, are little ulcers made deſignedly by the ſurgeon in various parts of the body, and kept open by the patient, for the preſervation or recovery of his health. See SURGERY.

ISTHMIA, or ISTHMIAN GAMES, one of the four ſolemn games which were celebrated every fifth year in Greece; ſo called from the Corinthian iſthmus, where they were kept.

ISTHMUS, in geography, a narrow neck of land, that joins two continents, or joins a peninſula to the terra firma, and ſeparates two ſeas,

ISTRIA, a peninſula in the north-part of the gulph of Venice, bounded by Carniola on the north; and on the ſouth, eaſt, and weſt, by the ſea.

ITALIAN, the language ſpoken in Italy.

ITALY, a country ſituated between ſeven and nineteen degrees eaſt long. and between thirty-eight and forty-ſeven degrees north latitude, bounded by Switzerland, and the Alps, which ſeparate it from Germany, on the north; by the gulph of Venice, on the eaſt; by the Mediterranean ſea, on the ſouth; and by the ſame ſea and the Alps, which ſeparate it from France, on the weſt; and if we include Savoy, which lies indeed on the weſt ſide of the Alps, between Italy and France, we muſt extend it a degree farther weſt: this is uſually deſcribed, however, with Italy, as it is contiguous to Piedmont, and has the ſame ſovereign, being a province of the king of Sardinia's dominions. Italy is ſaid to reſemble a boot, and is in length from north-weſt to ſouth-eaſt 600 miles; the breadth is very unequal; in the north, which may be called the top of the boot, it is about 400 miles broad from eaſt to weſt; in the calf of the leg, or middle, it is about 120 miles broad; and towards the ſouth, about the inſtep, eighty miles broad; and comprehends the following countries or ſubdiviſions. 1. In the north are the duchies of Savoy, Piedmont, and Montferrat; the territories of Genoa; the duchies of Milan, Mantua, Parma, Modena, and the territories of Venice. 2. In the middle of Italy, are the duchy of Tuſcany, the pope's dominions, and the ſtate of Lucca. 3. And in the ſouth is the kingdom of Naples.

ITCH, a cutaneous diſeaſe, ariſing from a corruption of a ſerous lymphatic matter, ſometimes attended with mild, ſometimes with more obſtinate and dangerous ſymptoms. See MEDICINE.

JUBILEE, a time of public and ſolemn feſtivity among the ancient Hebrews.

This was kept every fiftieth year: it began about autumnal equinox, and was proclaimed by the ſound of trumpet throughout all the country. At this time all ſlaves were releaſed, all debts annihilated, and all lands, houſes, wives, and children, however alienated, were reſtored to their firſt owners. During this whole year all kind of agriculture was forbidden, and the poor had the benefit of the harveſt, vintage, and other productions of the earth, in the ſame manner as in the ſabbatic or ſeventh year. As this was deſigned to put the Iſraelites in mind of their Egyptian ſervitude, and to prevent their impoſing the like upon their brethren, it was not obſerved by the Gentile proſelytes.

The Chriſtians, in imitation of the Jews, have likewiſe eſtabliſhed jubilees, which began in the time of pope Boniface VIII. in the year 1300, and are now practiſed every twenty-five years; but theſe relate only to the pretended forgiveneſs of ſins, and the indulgences granted by the church of Rome; together with the privilege of performing a thouſand frolics in maſquerade.

JUCATAN, or YUCATAN, a peninſula of Mexico, ſituated between 89° and 94° W. long. and between 16° and 21° N. lat.

JUDAISM, the religious doctrines and rites of the Jews. See JEWS.

JUDE, or *the general epiſtle of* JUDE, a canonical book of the New Teſtament, written againſt the heretics, who, by their diſorderly lives and impious doctrines, corrupted the faith and good morals of the Chriſtians. St. Jude draws them in lively colours, as men given up to their paſſions, full of vanity, conducting themſelves by worldly wiſdom, and not by the ſpirit of God.

JUDEA. See PALESTINE.

JUDENBURGH, a city of Stiria, in Germany: E. long 15°, N lat. 47° 22′.

JUDGE, a chief magiſtrate of the law, appointed to hear cauſes, to explain the laws, and to paſs ſentence.

Book of JUDGES, a canonical book of the Old Teſtament, ſo called from its relating the ſtate of the Iſraelites under the adminiſtration of many illuſtrious perſons who were called judges, from their being both the civil and military governors of the people, and who were raiſed up by God upon ſpecial occaſions, after the death of Joſhua, till the time of their making a king. In the time of this peculiar polity, there were ſeveral remarkable occurrences, which are recorded in this book. It acquaints us with the groſs impiety of a new generation which ſprung up after the death of Joſhua,

ſhua, and gives us a ſhort view of the diſpenſations of heaven towards this people, ſometimes relieving and delivering them, and at others ſeverely chaſtiſing them by the hands of their enemies.

JUDGMENT, among logicians, a faculty or rather act of the human ſoul, whereby it compares its ideas, and perceives their agreement or diſagreement.

JUDGEMENT, in law, the ſentence of the judges upon a ſuit, *&c.*

JUDOIGNE, a town of the Auſtrian Netherlands, in the province of Brabant, ſituated on the river Gheet, thirteen miles ſouth-eaſt of Louvain, and ſixteen north of Namur.

IVES, or St. IVES, a borough and port-town of Cornwal, ſituated on the Iriſh channel: it ſends two members to parliament: W. long. 6°, N. lat. 50° 18′.

JUGERUM, in Roman antiquity, a ſquare of 120 Roman feet; its proportion to the Engliſh acre being as 10000 to 16097.

JUGULAR, in anatomy, an appellation given to two veins of the neck, which ariſe from the ſubclavians. See ANATOMY, part IV.

IVICA, or YVICA, the capital of an iſland of the ſame name, fifty miles eaſt of Valencia in Spain: E. long. 1°, N. lat. 39°.

JUICE, denotes the ſap of vegetables, or the liquors of animals.

JUJUBES, in the materia medica, the name of a fruit of the pulpy kind, produced on a tree which Linnæus makes a ſpecies of rhamnus. See RHAMNUS.

The jujubes have been made a general ingredient in pectoral decoctions; but they are now ſeldom uſed on theſe occaſions, and are ſcarce at all heard of in preſcription, or to be met with in our ſhops.

JULEP, in pharmacy, a medicine compoſed of ſome proper liquor, and a ſyrup or ſugar of extemporaneous preparation, without decoction, deſigned for the concoction or alteration of the humours, or reſtoring the ſtrength.

JULIAN, or St. JULIAN, a harbour on the coaſt of Patagonia, in South America, where ſhips bound to the ſouth ſeas uſually touch: W. long. 74°, N. lat. 48° 15′.

JULIAN PERIOD, in chronology. See ASTRONOMY, p. 489.

JULIERS, the capital of the duchy of the ſame name, ſituated on the river Roer, twenty miles weſt of Cologn, and as many eaſt of Maeſtricht: E. long. 6°, N. lat. 50° 55′

JULPHA, or *Old* JULPHA, once the capital of Armenia, but now in ruins, the inhabitants being tranſplanted to a town within a mile of Iſpahan, called New Julpha, and there they carry on a foreign trade with all countries in Aſia. The ſituation of Old Julpha was in E. long. 46°, N. lat. 39°.

JULY, in chronology, the ſeventh month of the year, ſo called in honour of Julius Cæſar; before whoſe time it was known by the name of quintilis, as being the fifth month of the old Roman year.

JUNCUS, the RUSH, in botany, a genus of the hexandria monogynia claſs. The calix has ſix leaves; it has no corolla; and the berry is dry, and contains but one ſeed. There are 19 ſpecies, twelve of them natives of Britain.

JUNGERMANNIA, a genus of the cryptogamia algæ claſs. Of which there are 29 ſpecies, all natives of Britain.

JUNIPERUS, in botany, a genus of the diœcia monadelphia claſs. The male has no corolla, but has three ſtamina; the calix of the female conſiſts of three parts; it has three petals, and three ſtyli; and the berry contains three ſeeds. There are nine ſpecies, only one of which, *viz.* the communis or common juniper, is a native of Britain. The berries are uſed as carminatives and ſtomachics.

JUNK, in the ſea-language, old cables cut into ſhort pieces, and given to boatſwains for making ſwabs, plats, and nippers; as alſo to the ſhip-carpenters, and to poor people, to be picked into oakam, for caulking ſhips, *&c.*

JUNTO, in matters of government, denotes a ſelect council for taking cognizance of affairs of great conſequence, which require ſecrecy.

In Spain and Portugal, it ſignifies much the ſame with convention, aſſembly, or board among us: thus we meet with the junto of the three eſtates, of commerce, of tobacco, *&c.* See BOARD, *&c.*

IVORY, in natural hiſtory, *&c.* a hard, ſolid and firm ſubſtance, of a white colour, and capable of a very good poliſh. It is the tuſk of the elephant, (See ELEPHAS,) and is hollow from the baſe to a certain height, the cavity being filled up with a compact medullary ſubſtance, ſeeming to have a great number of glands in it. It is obſerved, that the Ceylon ivory, and that of the iſland of Achem, do not become yellow in the wearing, as all other ivory does; for this reaſon the teeth of theſe places bear a larger price than thoſe of the coaſt of Guinea.

JUPITER, in aſtronomy. See ASTRONOMY, p. 441.

JUREA, or JURA, a ſtrong city in Italy, in the province of Piedmont, ſituated on the river Doria, ſubject to the king of Sardinia: E. long. 7°, 36′; N. lat. 45°, 22′.

JURISPRUDENCE, the ſcience of what is juſt or unjuſt; or the knowledge of laws, rights, cuſtoms, ſtatutes, *&c.* neceſſary for the adminiſtration of juſtice.

JURY-MAST, whatever is ſet up in room of a maſt that has been loſt in a ſtorm or in an engagement, and to which a leſſer yard, ropes, and ſails, are fixed.

JUS DELIBERANDI, in Scots law, that right which an heir has, by law, of deliberating for a certain time whether he will repreſent his predeceſſor. See LAW, tit 27.

JUS DEVOLUTUM, in Scots law, the right of the church, of preſenting a miniſter to a vacant pariſh, in caſe the patron ſhall neglect to uſe that right within the time limited by law. See LAW, tit. 5.

JUS MARITI, in Scots law, the right the huſband acquires to his wife's moveable eſtate, in virtue of the marriage. See LAW, tit. 6.

JUS RELICTÆ, in Scots law, the right the wife has in the

the goods in communion, in caſe of the previous deceaſe of the huſband. See LAW, tit. 28.

JUS PREVENTIONIS, in Scots law, the preferable right of juriſdiction acquired by a court, in any cauſe to which other courts are equally competent, by having exerciſed the firſt act of juriſdiction. See LAW, tit. 2.

JUST, a ſportive combat on horſeback, man againſt man, armed with lances.

The difference between juſts and tournaments, according to Du Cange, conſiſts in this, that the latter is a genus of which the former is only a ſpecies. Tournaments included all kinds of military ſports and engagements, which were made out of gallantry and diverſion. Juſts were thoſe particular combats, where the parties were near each other, and engaged with lance and ſword.

JUSTICE, in a moral ſenſe, is one of the four cardinal virtues, which gives every perſon his due.

JUSTICE, in a legal ſenſe, a perſon deputed by the king to adminiſter juſtice to his ſubjects, whoſe authority ariſes from his deputation, and not by right of magiſtracy.

JUSTICE-SEAT, is the higheſt foreſt-court, always held before the lord chief juſtice in eyre of the foreſt; in which court fines are ſet for offences, and judgments given.

JUSTICIA, in botany, a genus of the diandria monogynia claſs. The corolla is ringent; and the capſule has two cells. There are 19 ſpecies, none of them natives of Britain.

JUSTICIAR, in the old Engliſh laws, an officer inſtituted by William the Conqueror, as the chief officer of ſtate, who principally determined in all caſes civil and criminal. He was called in Latin *Capitalis Juſticiarius totius Angliæ.*—For JUSTICIAR *in Scotland*, ſee LAW, tit. 3. § 13.

JUSTICIARY, or *Court of* JUSTICIARY, in Scotland. See LAW, tit. 3. § 10.

JUTES, the ancient inhabitants of Jutland, in Denmark.

JUTLAND, a peninſula of Denmark, anciently called the Cimbrian Cherſoneſe, ſituated between 8° and 11° of E. long. and between 55° and 58° of N. lat. bounded by the Categate ſea, which ſeparates it from Norway, on the north; by the ſame ſea, which divides it from the Daniſh iſlands and Sweden, on the eaſt; by Holſtein, on the ſouth; and by the German ocean, on the weſt. It is divided into north and ſouth Jutland; the ſouth being uſually called Sleſwic. The whole is about 180 miles in length, and 90 in breadth.

IVY, in botany. See HEDERA.

IXIA, in botany, a genus of the triandria monogynia claſs. The corolla conſiſts of ſix open equal petals; and it has three erect ſtigmata. There are ten ſpecies, none of them natives of Britain.

IXORA, in botany, a genus of the tetrandria monogynia claſs. The corolla conſiſts of one long funnel-ſhaped petal; and the berry contains four ſeeds. There are three ſpecies, none of them natives of Britain.

K.

KÆMPFERIA, in botany, a genus of the monandria monogynia claſs. The corolla conſiſts of ſix ſegments, three of them being large and open. There are two ſpecies, both natives of India. The root of this plant is the galangal, which was formerly uſed in bitter infuſions, but is now neglected in practice.

KAKENHAUSEN, a city of Livonia, ſubject to Ruſſia: E. long. 26°, N. lat. 57°.

KALI, in botany. See SALSOLA.

KALLO, a town of upper Hungary, ſituated in a lake twenty miles ſouth eaſt of Tockay.

KAOLIN, one of the ſubſtances whereof china-ware is made; being no other than a kind of talc reduced to powder, and made into a paſte with water.

KAUSBEUREN, an imperial city of Germany, thirty-two miles ſouth of Augſburg: E. long. 10° 45′, N. lat. 47° 50′.

KEBLA, an appellation given by the Mahometans to that part of the world where the temple of Mecca is ſituated, towards which they are obliged to turn themſelves when they pray.

KEDGING, in the ſea-language, is when a ſhip is brought up or down in a narrow river by means of the tide, the wind being contrary. To do this, they uſe to ſet their fore-courſe, or fore-top ſail and mizzen, that ſo they may flat her about; and if ſhe happens to come too near the ſhore, they let fall a kedge-anchor, with a hawſer faſtened to it from the ſhip, in order to turn her head about; which work is called kedging.

KEEL, the loweſt piece of timber in a ſhip, running her whole length from the lower part of her ſtem to the lower part of her ſtern-poſt. Into it are all the lower futtocks faſtened; and under part of it, a falſe keel is often uſed.

KEELSON, a principal timber in a ſhip, fayed withinſide croſs all the floor timbers; and being adjuſted to the keel with ſuitable ſcarfs, it ſerves to ſtrengthen the bottom of the ſhip.

KEEPER *of the great ſeal*, is a lord by his office, is ſtyled lord keeper of the great ſeal of Great-Britain, and is always one of the privy-council. All grants, charters and commiſſions of the king under the great ſeal, paſs through the hands of the lord-keeper; for without that ſeal, many of thoſe grants, *&c.* would be

be of no force; the king being, in the interpretation of the law, a corporation, and therefore paſſes nothing but by the great ſeal, which is alſo ſaid to be the public faith of the kingdom, being in the higheſt eſteem and reputation.

Whenever there is a lord-keeper, he is inveſted with the ſame place, authority, preheminence, juriſdiction, or execution of laws, as the lord chancellor of Great-Britain is veſted with.

The lord-keeper is conſtituted by the delivery of the great ſeal, *&c.*

KEEPER *of the privy ſeal*, is alſo a lord by his office, through whoſe hands all grants, pardons, *&c.* paſs before they come to the great ſeal, and even ſome things paſs this officer's hands which do not paſs the great ſeal at all. This officer is alſo one of the privy council, yet was anciently called clerk of the privy ſeal. His duty is to put the ſeal to no grant, *&c.* without a proper warrant; nor with warrant where it is againſt law, or inconvenient, but ſhall firſt acquaint the king therewith.

KEISERWAERT, a ſtrong town of Germany in the circle of Weſtphalia and duchy of Berg, ſituated on the Rhine, twenty-five miles north of Cologne, E. lon. 6° 8′, N. lat. 51° 20′.

KELLINGTON, a borough-town of Cornwall, thirteen miles ſouth of Launceſton, which ſends two members to parliament.

KELP, a fixed ſalt, or particular ſpecies of pot-aſh, procured by burning a ſpecies of ſalicoſa. See SALICOSA.

KELSO, a town of Scotland, in the ſhire of Mers, or Roxburgh, ſituated on the north ſide the Tweed, twenty miles ſouth-weſt of Berwick.

KEMPTEN, a city of Germany, in the circle of Swabia, ſituated on the river Iſer: E. lon. 10° 7′, N. lat. 47° 38′.

KENDAL, a market-town of Weſtmoreland, twenty-two miles ſouth-weſt of Appleby.

KENKS, in the ſea language, doublings in a rope or cable, when handed in and out, ſo that it does not run eaſy; or when any rope makes turns or twiſts, and does not run free in the block, then it is ſaid to make kenks.

KENNING *to a* TERCE, in Scots law, the dividing or ſetting off that part of the huſband's eſtate to his relict which ſhe is entitled to liferent after his death. See TERCE.

KENSINGTON, a pleaſant village in the county of Middleſex, two miles weſt of London; where is a royal palace, with large and fine gardens.

KENT, a county bounded by the river Thames on the north, by the ocean on the eaſt, by Suſſex and the Straits of Dover on the ſouth, and by Surrey on the weſt.

KERMAN, the capital of the province of Kerman, or Carimania, in Perſia: E. lon. 56° 30′, N. lat. 30°.

KERMES, in botany. See ILEX.

KERMES MINERAL. See CHEMISTRY, p. 140.

KERRY, a county of Ireland, in the province of Munſter, bounded by the river Shannon, which divides it from Clare, on the north; by Limeric and Cork, on the eaſt; by another part of Cork, on the ſouth; and by the Atlantic Ocean, on the weſt.

KESSEL, a town of Upper Guelderland, in the quarter of Roermonde, ſituated on the river Meuſe: E. lon. 6°, N. lat. 51° 25′.

KESTRIL, in ornithology. See FALCO.

KETMIA, in botany. See HIBISCUS.

KETTERING, a market-town of Northamptonſhire, ten miles north-eaſt of Northampton.

KETCH, in naval architecture, a veſſel with two maſts. See SHIP.

KEVEL, in ſhip-building, a piece of plank ſayed againſt the quickwork on the quarter-deck, in the ſhape of a ſemicircle; about which the running rigging is belaid.

KEXHOLME, the capital of the province of the ſame name in Finland, ſituated on the lake Ladoga, eighty miles north of Peterſburgh: E. lon. 30°, N. lat. 61° 30′.

KEY, a well known inſtrument for opening and ſhutting the locks of doors, cheſts, buroes, and the like.

KEY, in muſic, a certain fundamental note, or tone, to which the whole piece, be it in concerto, ſonata, cantata, *&c.* is accommodated, and with which it uſually begins, but always ends.

KEY-STONE of an arch, or vault, that placed at the top or vertex of an arch, to bind the two ſweeps together.

KIAM, a great river of China, which, taking its riſe near the weſt frontier, croſſes the whole kingdom eaſtward, and falls into the bay or gulph of Nanking, a little below that city.

KIAMSI, a province of China, bounded by that of Nanking on the north, and by that of Canton on the ſouth.

KIDDERMINSTER, a market-town twelve miles north of Worceſter.

KIDNEYS, in anatomy. See ANATOMY, p. 268.

KIGGELARIA, in botany, a genus of the dioecia decandria claſs. The calix of both male and female conſiſts of five ſegments, and the corolla of five petals; the antheræ of the male are perforated at the apex: The female has five ſtyli; the capſule has five valves, one cell, and many ſeeds. There is but one ſpecies, a native of Ethiopia.

KIDDARE, the capital of a county of the ſame name, in Ireland, twenty-ſeven miles ſouth-weſt of Dublin.

KILDERKIN, a liquid meaſure, containing two firkins.

KILKENNY, a county of Ireland, in the province of Leinſter, bounded by Queen's County, on the north; by the county of Wexford, on the eaſt; by Waterford, on the ſouth; and by the county of Tipperary, on the weſt. It is alſo the name of the capital of that county; and is ſituated in W. lon. 7° 15′, N. lat. 52° 30′.

KIMBOLTON, a market-town of Huntingtonſhire, nine miles ſouth-weſt of Huntington.

KING, in the general acceptation of the word, is a perſon who has a ſupreme authority, with the power of levying taxes, making laws, and enforcing an obedience to them: but in Britain, which is a limited monarchy,

monarchy, the power of the king is greatly reftrained; which is fo far from diminifhing his honour, that it adds a glory to his crown; for while other kings are abfolute monarchs over innumerable multitudes of flaves, the king of England has the diftinguifhed glory of governing a free people, the leaft of whom is protected by the laws: he has great prerogatives, and a boundlefs power in doing good; and is at the fame time only reftrained from acting inconfiftently with his own happinefs, and that of his people. He has all the enfigns of royalty, and all the marks of fovereignty; but while he has the power of making treaties, of fending and receiving ambaffadors, of conferring titles of honour, creating privy counfellors, officers of ftate, and judges, and may raife men and arms both for fea and land, he cannot force his fubjects to maintain them, or raife one tax by his fole authority: he has the privilege of coining money, but he cannot force the meaneft fubject to part with his property: he can pardon a criminal; but he cannot put a fubject to death, till he is condemned by his peers: he may at his pleafure call, continue, prorogue, and diffolve parliaments, and without his royal affent no bill in parliament can pafs into a law; yet he can neither act contrary to law, nor make new laws by his fole authority; on the contrary, he may even be fued and caft in his own courts.

At his coronation, he takes an oath to govern his people according to the ftatutes agreed on in parliament, to caufe law and juftice in mercy to be executed in all his judgments; to maintain, as much as in him lies, the laws of God, the true profeffion of the gofpel, and the proteftant reformed religion by law eftablifhed. But tho' he may mitigate the rigour of the law, and forgive offenders, he cannot pardon murder, where an appeal is brought by the fubject; nor any other crime, when the offender is impeached by the houfe of commons. He may lay an embargo on fhipping; but then it ought to be for the public good, and not for the private advantage of any particular traders. Writs, proceffes, commiffions, *&c.* are in his name; and he has a power not only to make courts, but to create univerfities, colleges, and boroughs; to incorporate a city or town, and to grant franchifes to fuch corporations; but they muft not, under colour thereof, fet up a monopoly. He is efteemed the head of the church in that part of his dominions called England. But notwithftanding thefe and other prerogatives, the king can take what he has a right to only by due courfe of law. In fhort, he has a principal fhare in the legiflative power, and the whole executive power is lodged in him; he is fuppofed prefent in all his courts, he can do no wrong, and, according to the laws of England, he never dies.

KING's BENCH, a court in which the king was formerly accuftomed to fit in perfon, and on that account was moved with the king's houfhold. This was originally the only court in Weftminfter-hall, and from this it is thought that the courts of common pleas and exchequer were derived. As the king in perfon is ftill prefumed in law to fit in this court, though only reprefented by his judges, it is faid to have fupreme authority; and the proceedings in it are fuppofed to be coram nobis, that is, before the king. This court confifts of a lord chief juftice and three other juftices or judges, who are invefted with a fovereign jurifdiction over all matters, whether of a criminal or public nature. All crimes againft the public good, though they do not injure any particular perfon, are under the cognizance of this court; and no private fubject can fuffer any unlawful violence or injury againft his perfon, liberty, or poffeffions, but a proper remedy is afforded him here; not only for fatisfaction of damages fuftained, but for the punifhment of the offender: and wherever this court meets with an offence contrary to the firft principles of juftice, it may punifh it. It frequently proceeds on indictments found before other courts, and removed by certiorari into this. Perfons illegally committed to prifon, though by the king and counfel, or either of the houfes of parliament, may be bailed in it; and in fome cafes, even upon legal commitments. Writs of mandamus are iffued by this court, for the reftoring of officers in corporations, *&c.* unjuftly turned out, and freemen wrongfully disfranchifed.

The court of king's bench is now divided into a crown-fide and plea-fide, the one determining criminal, and the other civil caufes: in the firft it determines criminal matters of all kinds, where the king is plaintiff; fuch as treafons, felonies, murders, rapes, robberies, riots, breaches of the peace, and all other caufes that are profecuted by indictment, information, *&c.* On the plea-fide, it determines all perfonal actions commenced by bill or writ; as actions of debt, upon the cafe, detinue, trover, ejectment, trefpafs, wafte, *&c.* againft any perfon in the cuftody of the marfhal of the court, as every perfon fued here is fuppofed to be by law.

The officers of this court on the crown-fide are the clerk and fecondary of the crown; and on the fide of the pleas there are two chief clerks or prothonotaries, and their fecondary and deputy, the cuftos brevium, two clerks of the papers, the clerk of the declarations, the figner and fealer of bills, the clerk of the rules, clerk of the errrors, and clerk of the bails; to which may be added the filazers, the marfhal of the court, and the crier.

Books of KINGS, two canonical books of the Old Teftament, fo called becaufe they contain the hiftory of the kings of Ifrael and Judah, from the beginning of the reign of Solomon, down to the Babylonifh captivity, for the fpace of near fix hundred years.

It is probable that thefe books were compofed by Ezra, who extracted them out of the public records, which were kept of what paffed in that nation.

KING's COUNTY, a county of Ireland, in the province of Leinfter, bounded by Weft-meath on the north, by the county of Kildare on the eaft, by Queen's county and Tipperary on the fouth, and by the river Shannon, which feparates it from Galway, on the weft.

KING's EVIL. See MEDICINE.

KING's FISHER, in ornithology. See ALCEDO.

KINGHORN, a town of Scotland, on the coaft of Fife, nine miles north of Edinburgh.

KINGSTON,

KINGSTON, a market-town of Surry, ſituated on the river Thames, twelve miles weſt of London.

KINGSTON, a port-town of Jamaica, ſituated on the north ſide of the bay of Port royal: W. long. 77°, N. lat. 17° 32′.

KINROSS, a town of Scotland, in the ſhire of Fife, ſituated on the lake of Loch-Leven, twenty miles north of Edinburgh.

KINSALE, a port-town of Ireland, in the county of Cork and province of Munſter, ſituated on the river Bandon, fourteen miles ſouth of the city of Cork: W. long. 8° 20′, and N. lat. 51° 32′.

KIOF, or KIOW, the capital of the Ruſſian Ukraine, on the frontiers of Poland: E. long. 30° 30′, and N. lat. 51°.

KIRK, a Saxon term, ſignifying the ſame with church.

KIRK OSWALD, a market town of Cumberland, twelve miles ſouth of Carliſle.

KIRK-SESSIONS, an inferior church judicatory in Scotland, conſiſting of the miniſters, elders, and deacons of a pariſh.

It regulates matters relating to public worſhip, catechiſing, viſitations, *&c.* and judges in caſes of fornication and leſſer ſcandals.

KIRKALDY, a town of Fifeſhire, in Scotland, ten miles north of Edinburgh.

KIRKHAM, a market-town of Lancaſhire, ſixteen miles ſouth of Lancaſter.

KIRKUDBRIGHT, a parliament-town of Scotland, which ranks with Dumfries, Annan, *&c.* ſituated on a bay of the Iriſh ſea, ſixty miles weſt of Carliſle: W. long. 4° 5′, and N. lat. 54° 38′.

KIRKWALL, the capital of the Orkney-iſlands, and ſituated in that of Pomona, is a parliament-town, which claſſes with Dingwall, Tain, *&c.* W. long. 25°, and N. lat. 59° 45′.

KITCHEN-GARDEN, a piece of ground laid out for the cultivation of fruit, herbs, pulſe, and other vegetables uſed in the kitchen. See GARDENING.

KITE. See FALCO.

KNARESBOROUGH, a borough-town in the north riding of Yorkſhire, fifteen miles north of York. It ſends two members to parliament.

KNAVE, in old law-books, an appellation given to a man-ſervant, or even to a male child.

KNAVESHIP, in Scots law, one of the names of the ſmall-duties payable in thirlage to the miller's ſervants, called ſequels. See SCOTS LAW, tit. 16.

KNAUTIA, in botany, a genus of the tetrandria monogynia claſs. The common calix is oblong, ſimple, and contains five flowers; the proper calix is ſimple, and above the fruit; the corollulæ are irregular; and the receptacle is naked. There are two ſpecies, none of them natives of Britain.

KNEE, in anatomy, the articulation of the thigh and leg-bones. See ANATOMY, part I. *&c.*

KNEE, in a ſhip, a crooked piece of timber, bent like a knee, uſed to bind the beams and futtocks together, by being bolted faſt into them both. Theſe are uſed about all the decks.

Carling-KNEES, in a ſhip, thoſe timbers which extend from the ſides to the hatch-way, and bear up the deck on both ſides.

KNIFE, a well-known inſtrument, made for cutting.

All ſorts of knives are prohibited to be imported.

KNIGHT, among the Romans, a perſon of the ſecond degree of nobility, following immediately that of the ſenators.

Part of the ceremony whereby this honour was conferred, was the giving of an horſe; for each had an horſe at the public charge, and received the ſtipend of a horſeman, to ſerve in the wars.

When the knights were taken in among the ſenators, they reſigned the privilege of having an horſe kept for them at the charge of the public: then it become neceſſary, in order to be a knight, that they ſhould have a certain revenue, that their poverty might not diſgrace the order; and when they failed of the preſcribed revenue, they were expunged out of the liſt of knights, and thruſt down among the Plebeians. Ten thouſand crowns is computed to have been the revenue required.

The knights at length grew ſo very powerful, that they became a balance between the power of the ſenate and people: they neglected the exerciſes of war, and betook themſelves principally to civil employments in Rome.

KNIGHT, in a modern ſenſe, properly ſignifies a perſon, who, for his virtue and martial proweſs, is by the king raiſed above the rank of gentlemen, into an higher claſs of dignity and honour.

Knighthood was formerly the firſt degree of honour in the army, and uſually conferred with a great deal of ceremony on thoſe who had diſtinguiſhed themſelves by ſome notable exploit in arms: the ceremonies at their creation have been various; the principal was a box on the ear, and a ſtroke with a ſword on the ſhoulder; they put on him a ſhoulder-belt, and a gilt ſword, ſpurs, and other military accoutrements; after which being armed as a knight, he was led to the church in great pomp. Camden deſcribes the manner of making a knight-batchelor among us, which is the loweſt, though the moſt ancient order of knighthood, to be thus: the perſon kneeling, was gently ſtruck on the ſhoulder by the prince, and accoſted in theſe words, "Riſe, or be a knight, in the name of God."

KNIGHT is alſo underſtood of a perſon admitted into any order, either purely military, or military and religious, inſtituted by ſome king or prince, with certain marks and tokens of honour and diſtinction, as the knights of the garter, knights of the thiſtle, knights of Malta, the knights of the Holy Ghoſt, *&c.*

KNIGHTS ERRANT, a pretended order of chivalry, much talked of in old romances, being a kind of heroes that travelled the world in ſearch of adventures, redreſſing wrongs, reſcuing damſels, and taking all occaſions of ſignalizing their proweſs. This romantic bravery of the old knights was heretofore the chimera of the Spaniards.

KNIGHTS *of the ſhire*, or KNIGHTS *of parliament*, in the

the British polity, are knights or gentlemen of estate, who are elected, on the king's writ, by the freeholders of every county, to represent them in parliament.

The qualifications of a knight of the shire in England, is to be possessed of 600 l. *per. ann.* in a freehold estate; and in Scotland 400 l. Scots valued rent, or 40 shillings of old extent. Their expences during their sitting, were, by a statute of Hen. VIII. to be defrayed by the county; but this is now scarce ever required.

KNIGHT-MARSHAL, an officer in the king's household, who has jurisdiction and cognizance of any transgression within the king's household and verge; as also of contracts made there, whereof one of the house is party.

KNIGHTS, in a ship, two thick short pieces of wood, commonly carved like a man's head, having four shivers in each, three for the halyards, and one for the top-ropes to run in: one of them stands fast bolted on the beams abaft the foremast, and is therefore called the fore-knight; and the other, standing abaft the main mast, is called the main knight.

KNOWLEDGE, is defined, by Mr Locke, to be the perception of the connection and agreement, or disagreement and repugnancy, of our ideas.

KONIGSBURG, a city of Poland, the capital of ducal Prussia, and of the king of Prussia's Polish dominions, situated on the river Pregel, near a bay of the Baltic sea, seventy miles north-east of Dantzick: E. long. 21°, and N. lat. 54° 40′.

KORAN, or ALCORAN. See MAHOMETANISM.

KOS, in Jewish antiquity, a measure of capacity, containing about four cubic inches: this was the cup of blessing, out of which they drank when they gave thanks after solemn meals, like that of the passover.

KUR, the ancient Cyrus, a river of Persia, which rises in the mountains of Georgia, and running south-east by Teflis, unites it streams with the river Arras (the ancient Arraxes) and falls into the Caspian sea, south of Baku.

KUTUCHTA, among the Calmuc Tartars, the name of their high-priest, or sovereign pontiff; formerly only the deputy of the delai-lama, or high-priest of the Tartars, but at present independent on him.

L.

LA, in music, the syllable by which Guido denotes the last sound of each hexachord: if it begins in C, it answers to our A; if in G, to E; and if in F, to D.

LABARUM, in Roman antiquity, the standard borne before the Roman emperors; being a rich purple streamer, supported by a spear.

LABDANUM, or LADANUM, a resin of the softer kind, though of too firm a consistence to be ranked among the fluid ones.

There are two kinds of it kept in the shops; one usually imported in bladders, to preserve it in its genuine soft consistence, and to prevent the evaporation of its finer parts; another in rolls, much inferior to the former in purity and virtue.

Labdanum should be chosen soft and moist, of a strong smell, pure, very inflammable, and diffusing a fragrant smell while burning. It is a resinous juice which exsudes from a tree of the cistus-kind.

In medicine it is used externally, to attenuate and discuss tumours; internally, it is more rarely used, but it is greatly extolled by some against catarrhs, and in dysenteries.

LABEL, in heraldry, a fillet usually placed in the middle along the chief of the coat, without touching its extremities. Its breadth ought to be a ninth part of the chief. It is adorned with pendants; and when there are above three of these, the number must be specified in blazoning.

This is a kind of addition to the arms of a second brother, to distinguish him from the first, and is esteemed the most honourable of all differences. See Plate CII.

LABIAL LETTERS, those pronounced chiefly by means of the lips.

LABIATED FLOWERS, monopetalous flowers, consisting of a narrow tube, with a wide mouth, divided into two or more.

LABIAU, a port-town of Prussia, situated on a bay of the Baltic sea, twenty miles north-east of Koningsburg: E. long. 22° 15′, N. lat. 55°.

LABORATORY or ELABORATORY, the chemists work-house, or the place where they perform their operations; where the furnaces are built, their vessels kept, *&c.* and in general, the term laboratory, is applied to any place where physical experiments in pharmacy, chemistry, pyrotechny, *&c.* are performed. See CHEMISTRY, p. 108, *&c.*

LABOUR, in general, denotes a close application to work or business. Among seamen a ship is said to be in labour, when she rolls and tumbles very much, either a hull, under sail, or at anchor.—It is also spoke of a woman in travail or child birth. See MIDWIFERY.

LABOURER, generally signifies one that does the most slavish and less artful part of a laborious work, as that of husbandry, masonry, *&c.*

LABRADOR, also called New-Britain, and Eskimaux, is a country in North America, bounded by Hudson's Straits and the Atlantic Ocean, on the north; by the same ocean, on the east; by the river of St. Lawrence and

and Canada, on the fouth; and by Hudfon's bay, on the weft: fituated between 59° and 79° of W. long. and between 50° and 64° of N. lat.

LABRUS, in ichthyology, a genus of fifhes belonging to the order of thoracici, the characters of which are thefe. The teeth are fharp, and the lips are fimple and very thick; there are fix bony rays in the membrane of the gills, and the opercula are fcaly. The rays of the back fin are furnifhed with a thread-like ramentum behind; the breaft fins are fharp-pointed; and the lateral line is ftraight. There are forty-one fpecies of labrus, diftinguifhed by the fhape of the tail, fins, colour, *&c.*

LABURNUM, in botany. See CYTISUS.

LABYRINTH, in anatomy. See ANATOMY, p. 297.

LAC, MILK, among phyficians, *&c.* See MILK.

LACCA, or LAC, in natural hiftory, improperly called gum-lac, a fort of wax of a red colour, collected in the Eaft-Indies by certain infects, and depofited on fticks faftened for that purpofe in the earth. It is brought over, either adhering to the fticks, or in fmall tranfparent grains, or in femi-tranfparent flat cakes: the firft is called ftick lac, the fecond feed lac, and the third fhell lac. On breaking a piece of ftick lac, it appears compofed of regular cells like the honey-comb, with fmall corpufcles of a deep red colour lodged in them: thefe are the young infects, and to thefe the lac owes its tincture, for when freed from them its colour is very dilute. The fhell and feed lacs, which do not exhibit any infects or cellular appearance upon breaking, are fuppofed to be artificial preparations of the other: the feed fort is faid to be the ftick lac bruifed and robbed of its more foluble parts; and the fhell to be the feed lac, melted and formed into cakes. The ftick lac therefore is the genuine fort, and ought alone to be employed for medicinal purpofes. This concrete is of great efteem in Germany and other countries, for laxity and fponginefs of the gums, proceeding from cold, or a fcorbutic habit: for this ufe the lac is boiled in water, with the addition of a little alum, which promotes its folution: or a tincture is made from it with rectified fpirit. This tincture is recommended alfo internally in the fluor albus, and in rheumatic and fcorbutic diforders: it has a grateful fmell, and a not unpleafant, bitterifh, aftringent tafte: in the Edinburgh pharmacopœia, a tincture is directed to be made with fpirit of fcurvy grafs. The principal ufe of lac among us is in certain mechanic arts as a colouring drug, and for making fealing wax.

LACE, in commerce, a work compofed of many threads of gold, filver or filk, interwoven the one with the other, and worked upon a pillow with fpindles, according to the pattern defigned. The open work being formed with pins, which are placed and difplaced as the fpindles are moved.

The importation of gold and filver lace is prohibited.

Bone LACE, a lace made of fine linen thread or filk, much in the fame manner as that of gold and filver. The pattern of the lace is fixed upon a large round pillow, and pins being ftuck into the holes or openings in the pattern, the threads are interwoven by means of a number of bobbins made of bone or ivory, each of which contains a fmall quantity of fine thread, in fuch a manner as to make the lace exactly refemble the pattern. There are feveral towns in England, and particularly in Buckinghamfhire, that carry on this manufacture; but vaft quantities of the fineft laces have been imported from Flanders.

LACEDEMON, the ancient name of Mifithra. See MISITHRA.

LACERTA, the lizard, in zoology, a genus of amphibious animals belonging to the order of reptilia, the characters of which are thefe: The body is naked, with four feet, and a tail. There are 49 fpecies, *viz.*

1. The crocodylus, or crocodile, has a compreffed jagged tail, five toes on the fore-feet, and four on the hind-feet. This is the largeft animal of the lizard kind. One that was diffected at Siam, an account of which was fent to the Royal Academy at Paris, was eighteen feet and a half long, of which the tail was no lefs than five feet and a half, and the head and neck above two and a half. He was four feet and nine inches in circumference where thickeft.

The hinder legs, including the thigh and the paw, were two feet and two inches long; the paws, from the joint to the extremity of the longeft claws, were above nine inches. They were divided into four toes; of which three were armed with large claws, the longeft of which was an inch and a half, and feven lines and a half broad at the root. The fourth toe was without a nail, and of a conical figure; but was covered with a thick fkin like fhagreen leather. Thefe toes were united with membranes like thofe of ducks, but much thicker.

The fore-legs had the fame parts and conformation as the arms of a man, both within and without; but they were fomewhat fhorter than thofe behind. The hands had five fingers, the two laft of which had no nails, and were of a conical figure, like the fourth toe on the hind paws. The head was long, and had a little rifing at the top; but the reft was flat, and efpecially towards the extremity of the jaws. It was covered with a fkin, which adhered firmly to the fkull and to the jaws. The fkull was rough and unequal in feveral places; and about the middle of the forehead there were two bony crefts, about two inches high. They were not quite parallel, but feparated from each other in proportion as they mounted upwards.

The eye was very fmall in proportion to the reft of the body, and was fo placed within its orbit, that the outward part, when fhut, was only a little above an inch in length, and run parallel to the opening of the jaws.

The nofe was placed in the middle of the upper jaw, near an inch from its extremity, and was perfectly round and flat, being two inches in diameter, of a black, foft, fpungy fubftance, not unlike the nofe of a dog. The noftrils were in the form of a Greek capital Σ, and there were two caruncles which filled and clofed them very exactly, and which opened as often as he breathed through the nofe. The jaws feemed to fhut one within another by means of feveral apophyfes, which

Fig. 4. LACERTA CROCODYLUS *or* CROCODYLE

Fig. 5. LACERTA CHAMÆLEON

Fig. 1. INDENTED

Fig. 6. LACERTA BASILISCUS

Fig. 2. INVECTED

Fig. 3. LABEL

A. Bell Sculpt.

which proceeded from above downwards, and from below upwards, there being cavities in the oppofite jaw to receive them. They had twenty-feven dog-teeth in the upper jaw, and fifteen in the lower, with feveral void fpaces between them. They were thick at the bottom, and fharp at the point; being all of different fizes, except ten large hooked ones, fix of which were in the lower jaw, and four in the upper. The mouth was fifteen inches in length, and eight and a half in breadth where broadeft; and the diftance of the two jaws, when opened as wide as they could be, was fifteen inches and a half. The fkull, between the two crefts, was proof againft a mufket ball, for it only rendered the part a little white that it ftruck againft.

The colour of the body was of a dark brown on the upper part, and of a whitifh citron below, with large fpots of both colours on the fides. From the fhoulders to the extremity of the tail he was covered with large fcales of a fquare form, difpofed like parallel girdles, and were fifty-two in number; but thofe near the tail were not fo thick as the reft. In the middle of each girdle there were four protuberances, which became higher as they aproached the end of the tail, and compofed four rows, of which the two in the middle were lower than the remaining two, forming three channels, which grew deeper the nearer they came to the tail, and were confounded with each other about two feet from its extremity.

The fkin was defended with a fort of armour, which, however, was not proof againft a mufket ball, contrary to what has been commonly faid. However, it muft be acknowledged, that the attitude in which it was placed might contribute not a little thereto; for probably, if the ball had ftruck obliquely againft the fhell, it would have flown off. Thofe parts of the girdles underneath the belly were of a whitifh colour, and were made up of fcales of divers fhapes. They were about one fixth of an inch in thicknefs, and were not fo hard as thofe on the back.

This creature lays eggs of the fize of thofe of a goofe, to the number of fixty; which fhe covers over with fand, and leaves to be hatched by the heat of the fun. They are to be met with in the rivers Nile, Niger, and Ganges, befides moft other large rivers in the fouthern parts of Afia, Africa, and America.

The crocodile is very deftructive to the lower people of Upper Egypt, often devouring women who come to the river to fetch water, and children playing on the fhore or fwimming in the river.

2. The caudiverbera, has a depreffed pinnatifid tail, and palmated feet. It is larger than the common green lizard, is found in Peru, and has got its name from its beating the ground with its tail. 3. The dracæra, has a long tail dentated above, a fmooth body, and equal toes. It is a native of America. 4. The fuperciliofa, has a carinated tail, and the fcales on the back and eye-brows are ciliated. It is a native of the Indies. 5. The fcutata, has a fubcompreffed tail, and a dentated future on the back. It is a native of Afia. 6. The monitor, has a carinated tail, and white eye-like fpots on the body. It is a native of the Indies. 7. The principalis, has a carinated tail, a creft on the throat, and a fmooth back. It is found in fouth America. 8. The bicarinata, has a compreffed tail with a double carina, and a quadruple carina on the back. It is a native of the Indies. 9. The cordylus has a fhort verticillated tail, and dentated fcales. It is found in Africa and Afia. 10. The ftellio, has a verticillated tail, and dentated fcales. It is a native of Africa. 11. The mauritanica, has a fhort verticillated tail fmooth at the apex. It is found in Mauritania. 12. The azurea, has a fhort verticillated tail, and fharp pointed fcales. It is a native of Africa. 13. The turcica, has a verticillated tail, and a rough grey body. It is a native of the Eaft Indies. 14. The ameiva, has a long verticillated tail, 30 fcutæ on the belly, and a plaited collar. It is a native of America. 15. The agilis, has a pretty long verticillated tail, with fharp fcales, and a collar formed by fcales. This is the common green lizard, and is a native both of Europe and India. 16. The algira, has a pretty long verticillated tail, and a yellow line on each fide of the body. It is found in Mauritania. 17. The feps has a long verticillated tail, with a reflected lateral future, and fquare fcales. It is a native of warm climates. 18. The fex-lineata, has a long verticillated tail, and fix white lines on the back. It is a native of Carolina. 19. The angulata, has a long hexagonal tail, and fharp carinated fcales. It is a native of America.

20. The chamæleon, has a crooked cylindrical tail.

The head of a large chamæleon is almoft two inches long, and from thence to the beginning of the tail it is four inches and a half. The tail is five inches long, and the feet two and a half. The thicknefs of the body is different at different feafons; for fometimes from the back to the belly it is two inches, and fometimes but one; for he can blow himfelf up and contract himfelf at pleafure. This fwelling and contraction is not only of the back and belly, but of the legs and tail.

Thefe different motions are not like thofe of other animals, which proceed from a dilatation of the breaft in breathing, and which rifes and falls fucceffively; but they are very irregular, as in tortoifes, and frogs. The chamæleon has continued as it were blown up for two hours together, and then he would grow lefs and lefs infenfibly; for the dilatation was always more quick and vifible than the contraction. In this laft ftate he appeared extremely lean, and the fpine of the back was fharp, and all his ribs might be told; likewife the tendons of the arms and legs might be feen very diftinctly.

The fkin is very cold to the touch; and, notwithftanding he feems fo lean, there is no feeling the beating of the heart. The furface of the fkin is unequal, and has a grain not unlike fhagreen, but very foft, becaufe each eminence is as fmooth as if it was polifhed. Some of thefe are as large as a middling pin's head on the arms, legs, belly, and tail, but on the fhoulders and head they are of an oval figure, and a little larger. Thofe under the throat are ranged in the form of a chaplet.

let, from the lower lip to the breaſt. Some on the head and back are amaſſed together in cluſters, with ſpaces between them, on which are almoſt imperceptible ſpots of a pale red and yellow colour; as well as the ground of the ſkin itſelf; which plainly appears between theſe cluſters. This ground changes colour when the animal is dead, becoming of a greyiſh brown, and the ſmall ſpots are whitiſh.

The colour of all theſe eminences, when the chamæleon is at reſt in a ſhady place, is of a bluiſh grey, except on the claws, where it is white with a little yellow; and the ſpaces between the cluſters is of a pale red and yellow, as was before obſerved. But when he is in the ſun, all parts of the body which are affected with the light, become of a greyiſh brown, or rather of a tawny. That part of the ſkin which the ſun does not ſhine on, changes into ſeveral brighter colours, which form ſpots of the ſize of half one's finger. Some of theſe deſcend from the ſpine half way on the back; and others appear on the ſides arms, and tail. They are all of an iſabella colour, from a mixture of a pale yellow and of a bright red, which is the colour of the ground of the ſkin.

The head of a chameleon is not unlike that of a fiſh, it being joined to the breaſt by a very ſhort neck, covered on each ſide with cartilaginous membranes reſembling the gills of fiſhes. There is a creſt directly on the top of the head, and two others on each ſide above the eyes, and between theſe there are two cavities near the top of the head. The muzzle is blunt, and not much unlike that of a frog; at the end there is a hole on each ſide for the noſtrils, but there are no ears, nor any ſign of any.

The jaws are furniſhed with teeth, or rather with a bone in the form of teeth, which he makes little or no uſe of, becauſe he lives upon ſwallowing flies and other inſects, without chewing them. The form, ſtructure, and motion of the eyes, have ſomething very particular; for they are very large, being almoſt half an inch in diameter. They are of a globous figure: which may be eaſily ſeen, becauſe they ſtand out of the head. They have a ſingle eye-lid like a cap, with a hole in the middle, through which the ſight of the eye appears, which is of a ſhining brown, and round it there is a little circle of a gold colour. This eye-lid has a grain like ſhagreen, as well as the other parts of the ſkin; and when the reſt of the body changes colour, and aſſumes ſpots of different ſhapes, thoſe on the lid always keep the ſame form, though they are tinctured with the ſame colour as the ſkin. But the moſt extraordinary thing relating to the eyes is, that this animal often moves one when the other is entirely at reſt; nay, ſometimes one eye will ſeem to look directly forward, and the other backward; and one will look up to the ſky when the other regards the earth.

That part of the body which is called the trunk, and comprehends the thorax and the belly, in a chamæleon is almoſt all thorax with little or no belly. The four feet are all of a length; and the only difference between them is, that thoſe before are turned backwards, and thoſe behind forwards. There are five toes on each paw, which have a greater reſemblance to hands than feet. They are all divided into two, which gives the appearance of two hands to each arm, and two feet to each leg; and though one of theſe parts have three toes, and the other but two, yet they ſeem to be all of the ſame ſize. Theſe toes lie together under the ſame ſkin as in a mitten; however, their ſhape might be ſeen through the ſkin. With theſe paws the chamæleon can lay hold of the ſmall branches of trees in the ſame manner as a parrot. When he is about to perch, he parts his toes different from birds, becauſe he puts two behind and two before. The claws are little, crooked, very ſharp, and of a pale yellow, proceeding but half way out of the ſkin, while the other half is hid beneath it. His walk is ſlower than that of a tortoiſe, and he ſeems to move along with an affectation of gravity. He ſeems to ſeek for a proper place to ſet his feet upon; and when he climbs up trees, he does not truſt to his feet like ſquirrels, but endeavours to find out clefts in the bark, that he may get a ſurer hold.

His tail is like that of a viper when it is puffed up and round; for otherwiſe the bones may be ſeen in the ſame manner as on the back. He always wraps his tail round the branches of trees, and it ſerves him as it were inſtead of a fifth hand.

He is a native of Africa and Aſia.

21. The gecko, has a cylindrical tail, concave ears, and a warty body. It is the Indian ſalamander of Bontius. "This animal is very frequent in Cairo, (ſays Haſſelquiſt) both in the houſes and without them. The poiſon of this animal is very ſingular, as it exhales from the lobuli of the toes. The animal ſeeks all places and things impregnated with ſea ſalt, and paſſing over them ſeveral times leaves this very noxious poiſon behind it. In July 1750, I ſaw two women and a girl, in Cairo, at the point of death, from eating cheeſe new ſalted, bought in the market, and on which this animal had dropt its poiſon. Once at Cairo, I had an opportunity of obſerving how acrid the exhalations of the toes of this animal are, as it ran over the hand of a man who endeavoured to catch it; there immediately roſe little puſtules over all thoſe parts the animal had touched; theſe were red, inflamed, and ſmarted a little, greatly reſembling thoſe occaſioned by the ſtinging of nettles. It emits an odd ſound, eſpecially in the night, from its throat, not unlike that of a frog." 22. The ſcincus, has a cylindrical tail, compreſſed at the point, and blunt marginated toes. This animal is found in Arabia Petræa near the Red Sea, and in Upper Egypt near the Nile. It is much uſed by the inhabitants of the Eaſt as an aphrodiſiacum, but not at this time by the Europeans. The fleſh of the animal is given in powder, with ſome ſtimulating vehicle; broth made of the recent fleſh, is likewiſe uſed by the Arabs. It is brought from Upper Egypt and Arabia to Alexandria, whence it is carried to Venice and Marſeilles, and from thence to all the apothecaries ſhops of Europe. It has been an error, common to almoſt all authors, to imagine the ſcincus to be a fiſh. 23. The orbicularis, has a cylindrical tail,

tail, and a roundifh belly. It is a native of Mexico. 24. The quinque-lineata, has a cylindrical tail, and five white lines on the back. It is found in Carolina. 25. The bafiiifcus, has a long cylindrical tail, a radiated fin on the back, and a creft on the hind part of the head. It is a native of South America. 26. The ignava, has a long cylindrical tail, a teethed ridge on the back, and a creft on the throat. It is a native of the Indies. 27. The calotes, has a long cylindrical tail, with the fore-part of the back and hind-part of the head teethed. It is a native of Ceylon. 28. The agama, has a long cylindrical tail, with prickles on the neck and hind part of the head. It is a native of America. 29. The umbra, has a long cylindrical tail, a callous creft on the nape of the neck, and a ftreaked back. It is a native of fouthern climates. 30. The plica, has a long cylindrical tail, a callous creft on the hind head, and a warty neck. It is a native of the Indies. 31. The marmorata, has a long cylindrical tail, a fmooth back, and a fmall teethed creft on the throat. It is a native of Spain. 32. The bullaris, has a long cylindrical tail, and a bladder on the throat, which it blows up when enraged. It is a native of Jamaica. 33. The ftrumofa has a long cylindrical tail, and a gibbous breaft. It is found in South America. 34. The tequifein, has a long cylindrical tail, and a plaited future on the fide. It is a native of the Indies. 35. The aurata, has a cylindrical tail, and round fhining fcales like gold. It is found in the iflands of Cyprus and Jerfey. 36. The nilotica, has a long tail with a triangular edge, and four lines of fcales on the back. It is a native of Egypt. 37. The punctata, has a long cylindrical tail, two yellow lines on the back, and is interfperfed with black points. It is found in Afia. 38. The lemnifcata, has a long cylindrical tail, and 8 white lines on the back. It is found in Guinea. 39. The fafciata, has a blue cylindrical tail, and five yellow lines on the back. It is a native of Carolina. 40. The chalcides, has a long cylindrical tail, and very fhort legs, with five toes on the feet. It is a native of Europe and Africa. 41. The vulgaris, has a cylindrical tail, four toes on the fore feet, and two dufky-coloured lines on the back. It is a native of Europe. 42. The aquatica, has a tail fomewhat cylindrical, and four toes on the fore-feet. It lives in the frefh waters, pools, &c. of Europe. 43. The paluftris, has a lanceolated tail, and four toes on the fore-feet. It inhabits the ftagnant waters of Europe. 44. The punctata, has a cylindrical tail, four toes on the fore-feet, and longitudinal rows of white fpots on the back. It is a native of Carolina. 45. The quatuor-lineata, has a long cylindrical tail, four toes on the fore-feet, and four yellow lines on the back. It is a native of North America. 46. The falamandra, has a fhort cylindrical tail, four toes on the fore-feet, and a naked porous body. This animal is vulgarly faid to live in fire; but it is found to be a miftake. It is found in the fouthern countries of Europe. 47. The anguina, has a very long verticillated tail, extremely rigid at the point. It is found at the Cape of Good-hope.

LACHNÆA, in botany, a genus of the octandria monogynia clafs. It has no calix; the corolla is divided into four fegments; the limbus is unequal; and the fruit, which is a kind of berry, contains but one feed. There are two fpecies, both natives of warm climates.

LACHRYMAL, in anatomy, an appellation given to feveral parts of the eye. See ANATOMY, p. 289.

LACHRYMATORY, in antiquity, a veffel wherein were collected the tears of a deceafed perfon's friends, and preferved along with the afhes and urn.

LACTEAL VESSELS, in anatomy. See ANAT. p. 263.

LACTIFEROUS, an appellation given to plants abounding with a milky juice, as the fow-thiftle, and the like.

LACTUCA, LETTUCE, in botany. See LETTUCE.

LACUNÆ, in anatomy. See ANATOMY, p. 275, 276.

LACUNAR, in architecture, an arched roof or ceiling, more efpecially the planking or flooring above porticos and piazzas.

LADENBURG, a town of Germany, fituated on the river Neckar, eighty miles north-weft of Heidelburg.

LADRONE ISLANDS, are fituated in the Pacific Ocean, between 12° and 28° of N. lat. and about 140° E long.

LADY'S BEDSTRAW. See GALLIUM.

LADY'S MANTLE. See ALCHIMILLA.

LALY'S SMOCK. See CARDAMINE.

LADY'S SLIPPER. See CYPRIPEDIUM.

LADY'S TRACES. See OPHRYS.

LADY DAY, in law, the 25th of March, being the annunciation of the holy virgin. See ANNUNCIATION.

LAGOECIA, ROUND-HEADED CUMMIN, in botany, a genus of the pentandria monogynia clafs. It has both an univerfal and partial involucrum; the petals are bifid; and the feed is folitary. There is but one fpecies, a native of Crete.

LAGOPUS, in ornithology. See TETRAO.

LAGOS, a port-town of Portugal, in the province of Algarva: W. long. 9° 27′, N. lat. 36° 45′.

LAGURUS, in botany, a genus of the triandria digynia clafs. The calix has a double valve, with a villous aun, and the exterior petal has two auns at the end. There are two fpecies, none of them natives of Britain.

LAHOLM, a port-town of Gothland, in Sweden, fixty miles north of Copenhagen.

LAHOR, the capital of a province of the fame name in the hither India: E. long. 75° and N. lat. 33°.

LAKE, a collection of waters contained in fome cavity in an inland place, of a large extent, furrounded with land, and having no communication with the ocean.

LAMA, the fovereign pontiff, or rather god of the Afiatic Tartars, inhabiting the country of Barantola. The lama is not only adored by the inhabitants of the country, but alfo by the kings of Tartary, who fend him rich prefents, and go in pilgrimage to pay him adoration, calling him *lama congiu*, i. e. god the everlafting father of heaven. He is never to be feen but in a fecret place of his palace, amidft a great number of lamps, fitting crofs-legged upon a cufhion, and adorned all

all over with gold and precious ftones; where, at a diftance, they proftrate themfelves before him, it not being lawful for any to kifs even his feet. He is called the great lama, or lama of lamas, that is, prieft of priefts. And to perfuade the people that he is immortal, the inferior priefts, when he dies, fubftitute another in his ftead, and fo continue the cheat from generation to generation. Thefe priefts perfuade the people, that the lama was raifed from death many hundred years ago, that he has lived ever fince, and will continue to live for ever.

LAMB, in zoology, the young of the fheep kind. See Ovis.

LAMBOIDES, in anatomy. See Anatomy, p. 152.

LAMELLÆ, in natural hiftory, denotes very thin plates, fuch as the fcales of fifhes are compofed of.

LAMENTATIONS, a canonical book of the Old Teftament, written by the prophet Jeremiah. The two firft chapters of this book are employed in defcribing the calamities of the fiege of Jerufalem. In the third, the author deplores the perfecutions he himfelf had fuffered. The fourth turns upon the defolation of the city and temple, and the misfortune of Zedekiah. The fifth chapter is a prayer for the Jews in their difperfion and captivity; and at the end of all, he fpeaks of the cruelty of the Edomites, who had infulted Jerufalem in her mifery. The firft four chapters of the lamentations are an abcedary, every verfe or couplet beginning with one of the letters of the Hebrew alphabet, in the alphabetical order.

LAMINÆ, in phyfiology, the thin plates whereof many fubftances confift.

LAMIUM, dead-nettle, in botany, a genus of the didynamia gymnofpermia clafs. The fuperior labium is entire and vaulted; the inferior one confifts of two lobes; in the margin of the faux on each fide there is a remarkable tooth. There are eight fpecies, three of them natives of Britain, *viz.* the album, or white dead-nettle; the rubrum, or red dead nettle; and the amplexicaule, or great henbit.

LAMMAS-day, a feftival celebrated on the firft of Auguft by the Romifh church, in memory of St. Peter's imprifonment.

LAMP, a veffel containing oil, with a lighted wick.

Dr. St. Clair, in Phil. Tranf. n° 245, gives the defcription of an improvement upon the common lamp. He propofes that it fhould be made two or three inches deep, with a pipe coming from the bottom almoft as high as the top of the veffel: let it be filled fo high with water as to cover the hole of the pipe at the bottom, that the oil may not get in at the pipe, and fo be loft. Then let the oil be poured in, fo as to fill the veffel almoft brim full, which muft have a cover pierced with as many holes as there are wicks defigned. When the veffel is thus filled, and the wicks are lighted, if water falls in by drops at the pipe, it will always keep the oil at the fame height, or very near; the weight of the water being to that of the oil as 20 $\frac{8}{11}$ to 19, which in two or three inches makes no great difference. If the water runs fafter than the oil waftes, it will only run over at the top of the pipe, and what does not run over will come under the oil, and keep it at the fame height.

LAMPAS, in farriery. See Farriery, p. 557.

LAMPREY. See Petromyzon.

LAMPSACUS, a port-town of the leffer Afia, at the entrance of the Propontis, oppofite to Gallipoli, fituated eighty miles fouth-weft of Conftantinople: E. long. 28°, N. lat. 40° 12′.

LANCASTER, the county-town of Lancafhire: W. long. 2° 44′, N. lat. 54°. It fends two members to parliament.

LANCEOLATED leaf. See Botany, p. 639.

LANCET, a chirurgical inftrument, fharp-pointed, and two-edged, chiefly ufed for opening veins in the operation of phlebotomy, or bleeding; alfo for laying open abfceffes, tumors, &c.

LANCHANG, the capital of the kingdom of Laos, in the further India: E. long. 101°, N. lat. 20°.

LAND, in a limited fenfe, denotes arable ground. See Agriculture.

Land, in the fea-language, makes part of feveral compound terms; thus *land-laid*, or to lay the land, is juft to lofe fight of it. *Land-locked*, is when land lies all round the fhip, fo that no point of the compafs is open to the fea; if fhe is at anchor in fuch a place, fhe is faid to ride land-locked, and is therefore concluded to ride fafe from the violence of winds and tides. *Land mark*, any mountain, rock, fteeple, tree, &c. that may ferve to make the land known at fea. *Land is fhut in*, a term ufed to fignify that another point of land hinders the fight of that the fhip came from. *Land to*, or the fhip *lies land to;* that is, fhe is fo far from fhore that it can only be juft difcerned. *Land turn*, is a wind that in almoft all hot countries blows at certain times from the fhore in the night. *To fet the land*, that is, to fee by the compafs how it bears.

LANDAFF, a city and bifhop's fee of Glamorganfhire, in fouth Wales, twenty-fix miles north weft of Briftol: W. long. 3° 20′, N. lat. 51° 33′.

LANDAU, a city of Germany, in the circle of the Upper Rhine, and landgraviate of Alface, fituated fifteen miles fouth-weft of Spire: E. long. 8°, N. lat. 49° 12′.

LANDEN, a fmall town of the Auftrian Netherlands, in the province of Brabant, eighteen miles fouth eaft of Louvain, and twenty miles north of Namur.

LANDGRAVE, the German name for a count or earl, that has the government of a province, country, or large tract of land.

LANDGRAVIATE, or landgravate, the office, authority, jurifdiction, or teritory of a landgrave.

LANDRECY, a town of the French Netherlands, in the province of Hainault: E. long. 3° 25′, N. lat. 50° 5′.

LANDSCROON, a port-town of Sweden, in the province of Gothland, and territory of Schonen, fituated on the Baltic fea, within the Sound: E. long. 14° 20′, N. lat. 55° 42′.

LANDSHUT, a city of Germany, and the capital of Lower Bavaria, fituated forty miles north-eaft of Munich: E. long. 12° 6′, N. lat. 48° 30′.

LANDSKIP, or LANDSCAPE, in painting, the view or profpect of a country, extended as far as the eye will reach.

Landfkips are efteemed one of the loweft branches of painting, reprefenting fome rural fcene, as hills, valleys, rivers, country-houfes, *&c.* where human figures are only introduced as accidents.

LANDSPERG, the name of two towns in Germany; one fituated on the river Warta, thirty-two miles north-eaft of Frankfort upon the Oder; and the other in Bavaria, twenty-three miles fouth of Augfburg.

LANERK, a parliament town of Scotland, fituated on the river Clyde, twenty miles fouth-eaft of Glafgow.

LANGREL SHOT, at fea, that confifting of two bars of iron, joined by a chain or fhackle, and having half a ball of iron fixed on each end; by means of which apparatus, it does great execution among the enemy's rigging.

LANGRES, a great city of Champaign, the bifhop of which is one of the twelve peers of France: E. long. 5° 22′, and N. lat. 48°.

LANGUAGE, in the moft general meaning of the word, fignifies any found uttered by an animal, by which it expreffes any of its paffions, fenfations, or affections; but it is more particularly underftood to denote thofe various modifications of the human voice, by which the feveral fenfations and ideas of one man are communicated to another.

Nature has endowed every animal with powers fufficient to communicate to others of the fame fpecies fome of its fenfations and defires. The organs of moft animals are fo formed, as readily to perceive and underftand (as far as is neceffary for their particular fpecies of exiftence) the voice of thofe of their own kind; by means of which they affemble together, for the defence or prefervation of the fpecies. But as they rife higher in the order of intellectual powers, the powers of expreffion likewife increafe. However, the voice alone, even when endowed with a great extent of modulation, is incapable of conveying all that variety of emotions and fenfations, which on many occafions are neceffary to be communicated. In all thefe cafes, motion and gefture are called in to fupply the defects of the voice. The amorous pigeon does not truft folely to his plaintive cooing in order to foften the rigour of his reluctant mate, but adds to it the moft fubmiffive and expreffive geftures; and the faithful dog, finding his voice alone infufficient to exprefs his joy at meeting with his mafter, is obliged to have recourfe to a variety of endearing actions. But man—the moft diftinguifhed of all the animal creation,—although endowed with a power of voice and expreffion of countenance and gefture eminently fuperior to all the creatures of God, finds that all thefe united are not fufficient to exprefs the infinite variety of ideas with which his mind is ftored: for although thefe may powerfully exprefs the paffions and ftronger feelings of the mind; yet as they are incapable of expreffing the feveral progreffive fteps of perception by which his *reafon* afcends from one degree of knowledge to another, he has been obliged to difcover, by means of his reafoning faculty, a method of expreffing with certainty, and communicating with the utmoft facility, every perception of his mind.—With this view, having obferved, that befides the power of uttering fimple founds, and the feveral variations of thefe into acute or grave, open or fhrill. *&c.* by which his ftronger feelings were naturally expreffed, he was likewife endowed with a power of ftopping or interrupting thefe founds, by certain clofings of of the lips with one another, and of the tongue with the palate, *&c.* he has taken advantage of thefe circumftances, and formed unto himfelf a language capable of expreffing every perception of the mind; for by affixing at all times the fame idea to any one found or combination of founds thus modified and joined together, he is enabled at any time to excite in the mind of any other perfon an idea fimilar to that in his own mind, provided the other perfon has been previoufly fo far inftructed as to know the particular modification of found which has been agreed upon as the *fymbol* of that idea.—Thus man is endowed with two different fpecies of language: one confifting of tones and geftures; which as it is natural to man confidered as a diftinct fpecies of animals, and neceffary for the prefervation and well-being of the whole, is univerfally underftood by all mankind: thus laughter and mirth univerfally exprefs chearfulnefs of mind; while tears, in every part of the globe, difcover a heart overflowing with tender fenfations; and the humble tone of fupplication, or the acute accent of pain, are equally underftood by the Hurons of America, and by the more refined inhabitants of Europe. The other fpecies of language, as it is entirely artificial, and derives its power from particular compact, (for before any thing can be recognifed as the fymbol of an idea, feveral perfons muft firft agree that fuch an idea muft always be denoted by this fymbol,) muft be different in different parts of the globe; and every diftinct form which it may affume, from the different genius of every fociety who originally formed a particular language for themfelves, will be altogethet unintelligible to every other body of men, but thofe belonging to the fame fociety where that language was originally invented, or thofe who have been at pains to acquire a knowledge of it by means of ftudy.

It is unneceffary for us here to draw any parallel between the nature of thefe two different fpecies of language; it being fufficiently evident, that the artificial language does not debar the ufe of the tones and geftures of the natural, but tends to afcertain the meaning of thefe with greater precifion, and confequently to give them greater power. Man muft therefore reap many advantages from the ufe of artificial language, which he could not have enjoyed without it. It is equally plain, that the one, being natural and infpired, muft remain nearly the fame, without making any progrefs to perfection; whereas the other, being entirely the invention of man, muft have been exceedingly rude and imperfect at firft, and muft have arrived by flow degrees at greater and greater perfection, as the reafoning faculties acquired vigour and acutenefs. It muft likewife be fubject to perpetual changes, from that variety of incidents which affect all fublunary things: and

and thefe changes muft always correfpond with the change of circumftances in the people who make ufe of that particular language: for when any particular fet of ideas become prevalent among any fociety of men, words muft be adopted to exprefs them; and from thefe the language muft affume its character. Hence the reafon why the language of all barbarous and uncivilized people is rude and uncultivated; while thofe nations which have improved their reafoning faculties, and made fome progrefs in the polite arts, have been no lefs diftinguifhed by the fuperiority of their language than by their pre-eminence in other refpects.—The language of a brave and martial people is bold and nervous, although perhaps rude and uncultivated; while the language of thofe nations in which luxury and effeminancy prevail, is flowing and harmonious, but devoid of force and energy of expreffion.

It may be confidered as a general rule, that the language of any nation is an exact index of the ftate of their minds, But as man is naturally an imitative animal, and in matters of this kind never has recourfe to invention but through neceffity; if by fome accident any part of a nation fhould be feparated from that community to which they belonged, after a language had been invented, they would retain the fame general founds and *idiom* of language with thofe from whom they were feparated; although in procefs of time thefe two people, by living in countries of a diffimilar nature, or being engaged in different occupations, and leading a different manner of life, might in time lofe all knowledge of one another, affume a different national character and oppofite difpofitions of mind, and form each of them a diftinct language to themfelves, totally different in genius and ftyle, though agreeing with one another in the fundamental founds and general idiom: fo that if this particular idiom, formed before their feparation, fhould happen to be more peculiarly adapted to the genius of one of thefe people than the other, that particular people whofe natural genius and ftyle of language was not in concord with the *idiom* which they had adopted, would labour under an inconvenience on this account which they never would be able entirely to overcome; and this inconvenience would prevent their language from attaining fuch a degree of perfection, as the genius of the people would otherwife naturally have led them to. Thus languages have been originally formed; and thus that happy concord of circumftances which have concurred to raife fome languages to that height of perfection which they have attained may be eafily accounted for, while many ineffectual efforts have been made to raife other languages to the fame degree of excellence.

We fhall not here enter upon any fruitlefs inquiries, with a view to difcover if only one language was originally formed, or if any language that we are acquainted with has a greater claim to that much envied pre-eminence than others. We have feen, that the difcovery of language is entirely within our reach, and evidently the invention of man; and therefore that the invention of different languages by different focieties, is extremely probable. But thefe different focieties, in procefs of time, behoved to intermix by war or commerce, and their different languages would likewife become mixed. Hence during the fucceffion of many ages, while the principles of language were not underftood, many different languages muft have been formed, while others may have funk into oblivion, efpecially in thofe early ages before the invention of letters, which alone could preferve their memory. In vain, therefore, would we endeavour to difcover the ftate of thofe nations or languages of which we have but obfcure traces in hiftory. Indeed we have no reafon to lament our lofs in this particular; for fuppofing fuch a difcovery could be made, we could derive little advantage from it. The antiquity of a language does not imply any degree of excellence: fome nations have made more progrefs in improving their mental faculties, and refining their language, in a few years, than others have done in many ages. We fhall therefore leave this fubject, and proceed to make fome remarks on the advantages or defects of fome of thofe *idioms* of language with which we are moft intimately acquainted, as this may perhaps lead us to fome difcoveries of real utility to ourfelves.

As the words IDIOM and GENIUS of a language are often confounded, it will be neceffary to inform the reader, that by IDIOM we would here be underftood to mean *that general mode of arranging words into fentences which prevails in any particular language*; and by the GENIUS of a language we mean to exprefs *the particular fet of ideas which the words of any language, either from their formation or multiplicity, are moft naturally apt to excite in the mind of any one who hears it properly uttered.* Thus although the *Englifh*, *French*, *Italian*, and *Spanifh* languages, nearly agree in the fame general IDIOM; yet the particular GENIUS of each is remarkably different: The *Englifh* is naturally bold nervous, and ftrongly articulated; the *French* is weaker, and more flowing; the *Italian* more foothing and harmonius; and the *Spanifh* more grave, fonorous, and ftately. Now, when we examine the feveral languages which have been moft efteemed in Europe, we find that there are only two diftinct IDIOMS among them which are effentially diftinguifhed from one another; and all thefe languages are divided between thefe two idioms, following fometimes the one, and fometimes the other, either wholly or in part. The languages which may be faid to adhere to the firft IDIOM, are thofe which in their conftruction follow the order of nature; that is, exprefs their ideas in the natural order in which they occur to the mind; the fubject which occafions the action appearing firft; then the action, accompanied with its feveral modifications; and, laft of all, the object to which it has reference.—Thefe may be properly called ANALOGOUS languages; and of this kind are the Englifh, French, and moft of the modern languages in Europe.—The languages which may be referred to the other IDIOM, are thofe which follow no other order in their conftruction than what the tafte or fancy of the compofer may fuggeft; fometimes making the object, fometimes the action, and fometimes the modification of the action, to precede or follow the other parts. The confufion which this might occafion is avoided by the particular manner of *inflecting* their words, by which they are made to refer to the others with which they ought to be connected, in whatever

ever part of the fentence they occur, the mind being left at liberty to connect the feveral parts with one another after the whole fentence is concluded. And as the words may be here tranfpofed at pleafure, thofe languages may be called TRANSPOSITIVE languages. To this clafs we muft, in an efpecial manner, refer the *Latin* and *Greek* languages.—As each of thefe IDIOMS has feveral advantages and defects peculiar to itfelf, we fhall endeavour to point out the moft confiderable of them, in order to afcertain with greater precifion the particular character and excellence of fome of thofe languages now principally fpoken or ftudied in Europe.

The partiality which our forefathers, at the revival of letters in Europe, naturally entertained for the Greek and Roman languages, made them look upon every diftinguifhing peculiarity belonging to them, as *one* of the *many* caufes of the amazing fuperiority which thefe languages evidently enjoyed above every other at that time fpoken in Europe.—This blind deference ftill continues to be paid to them, as our minds are early prepoffeffed with thefe ideas, and as we are taught in our earlieft infancy to believe, that to entertain the leaft idea of our own language being equal to the Greek or Latin in any particular whatever, would be a certain mark of ignorance or want of tafte.—Their rights, therefore, like thofe of the church in former ages, remain ftill to be examined; and we, without exerting our reafon to difcover truth from falfehood, tamely fit down fatisfied with the idea of their undoubted pre-eminence in every refpect.—But if we look around us for a moment, and obferve the many excellent productions which are to be met with in almoft every language of Europe, we muft be fatisfied, that *even thefe* are now poffeffed of *fome* powers which might afford at leaft a prefumption, that, if they were cultivated with a proper degree of attention, they might, in *fome refpects*, be made to rival, if not to excel, thofe beautiful and juftly admired remains of antiquity.—Without endeavouring to derogate from their merit, let us, with the cool eye of philofophic reafoning, endeavour to bring before the facred tribunal of Truth fome of thofe opinions which have been moft generally received upon this fubject, and reft the determination of the caufe on her impartial decifion.

The learned reader well knows, that the feveral changes which take place in the arrangement of the words in every TRANSPOSITIVE language could not be admitted without occafioning great confufion, unlefs certain claffes of words were endowed with particular variations, by means of which they might be made to refer to the other words with which they ought naturally to be connected.—From this caufe proceeds the neceffity of feveral variations of *verbs*, *nouns*, and *adjectives;* which are not in the leaft effential or neceffary in the ANALOGOUS languages, as we have pretty fully explained under the article GRAMMAR, to which we refer for fatisfaction on this head. We fhall in this place confider, whether thefe variations are an advantage or a difadvantage to language.

As it is generally fuppofed, that every language whofe verbs admit of *inflection*, is on that account much more perfect than one where they are varied by *auxiliaries;* we fhall, in the firft place, examine this with fome degree of attention; and that what is faid on this head may be the more intelligible, we fhall give examples from the Latin and Englifh languages. We make choice of thefe languages, becaufe the Latin is more purely *tranfpofitive* than the Greek, and the Englifh admits of lefs *inflection* than any other language that we are acquainted with.

If any preference be due to a language from the one or the other method of *conjugating* verbs, it muft in a great meafure be owing to one or more of thefe three caufes: —Either it muft admit of a greater variety of founds, and confequently more room for harmonious diverfity of tones in the language;—or a greater freedom of expreffion is allowed in utering any fimple idea, by the one admitting of a greater variety in the arrangement of the words which are neceffary to exprefs that idea than the other does;—or, laftly, a greater precifion and accuracy in fixing the meaning of the perfon who ufes the language, arife from the ufe of one of thefe forms above the other! —for, as every other circumftance which may ferve to give a diverfity to language, fuch as the general and moft prevalent founds, the frequent repetition of any one particular letter, and a variety of other circumftances of that nature, which may ferve to debafe a particular language, are not influenced in the leaft by the different methods of varying the verbs, they cannot be here confidered. We fhall therefore proceed to make a comparifon of the advantages or difadvantages which may accrue to a language by inflecting their verbs, with regard to each of thefe particulars.

The *firft* particular that we have to examine, is, Whether the one method of expreffing the variations of a verb admits of a greater variety of founds.—In this refpect the *Latin* feems, at firft view, to have a great advantage over the *Englifh:* for the word *amo*, *amabam*, *amaveram*, *amavero*, *amem*, &c. feem to be more different from one another than the Englifh tranflations of thefe, *I love*, *I did love*, *I had loved*, *I fhall have loved*, *I may love*, &c. for, although the fyllable AM is repeated in every one of the firft, yet as the laft fyllable ufually ftrikes the ear with greater force, and leaves a greater impreffion than the firft, it is very probable that many will think the frequent repetition of the word LOVE will, in the laft inftance, appear more ftriking to the ear than the other: we will therefore allow this its full weight, and grant that there is as great, or even a greater difference between the founds of the different *tenfes* of a Latin verb, than there is between the words that are equivalent to them in Englifh.—But as we here confider the variety of founds of the language in general, before any juft conclufion can be drawn, we muft not only compare the different parts of the fame verb, but alfo compare the different verbs with one another in each of thefe languages.—And here, at firft view, we perceive a moft ftriking diftinction in favours of the *analogous* language over the *inflected:* for as it would be impoffible to form a particular fet of inflections different from one another for each particular verb, all thofe languages which have adopted this method have been obliged to reduce their verbs into a fmall number of claffes; all the words of each of which claffes, commonly called *conjugations*, have the feveral variations of the *modes*, *tenfes*, and *perfons*, expreffed

expreſſed exactly in the ſame manner, which muſt of neceſſity introduce a ſimilarity of ſounds into the language in general, much greater than where every particular verb always retains its own diſtinguiſhing ſound.—To be convinced of this, we need only repeat any number of verbs in Latin and Engliſh, and obſerve one which ſide the preference with reſpect to variety of ſounds muſt fall.

Pono,	*I put.*	Moveo,	*I move.*
Dono,	*I give.*	Doleo,	*I ail.*
Cano,	*I ſing.*	Lugeo,	*I mourn.*
Sono,	*I ſound.*	Obeo,	*I die.*
Orno,	*I adorn.*	Gaudeo,	*I rejoice.*
Pugno,	*I fight.*	Incipio,	*I begin.*
Lego,	*I read.*	Faceo,	*I make.*
Scribo,	*I write.*	Fodio,	*I dig.*
Puto,	*I think.*	Odio,	*I hate.*
Vivo,	*I live.*	Rideo,	*I laugh.*
Ambulo,	*I walk.*	Impleo,	*I fill.*
Loqueo,	*I ſpeak.*	Abſtineo,	*I forbear.*

The ſimilarity of ſounds is here ſo obvious in the Latin as to be perceived at the firſt glance: nor can we be ſurpriſed to find it ſo, when we conſider, that all their regular verbs, amounting to four thouſand or upwards, muſt all be reduced to four conjugations, and even theſe differing but little from one another, which muſt of neceſſity produce the ſameneſs of ſounds which we here perceive; whereas every language that follows the natural order, like the Engliſh, inſtead of theſe ſmall number of uniform terminations, have almoſt as many diſtinct ſounds as original verbs in their language.

But if, inſtead of the preſent of the indicative mood, we ſhould take almoſt any other tenſe of the Latin verb, the ſimilarity of ſounds would be ſtill more perceptible, as many of theſe tenſes have the ſame termination in all the four conjugations, particularly in the imperfect of the indicative, as below.

Pona-bam;	*I did put,*	*I put.*
Dona-bam;	*I did give,*	*I gave.*
Cane-bam;	*I did ſing,*	*I ſung.*
Sona-bam;	*I did ſound,*	*I ſounded.*
Orna-bam;	*I did adorn,*	*I adorned.*
Pugna-bam;	*I did fight,*	*I fought.*
Lege-bam;	*I did read,*	*I read.*
Scribe-bam;	*I did write,*	*I wrote.*
Puta-bam;	*I did think,*	*I thought.*
Vive-bam;	*I did live,*	*I lived.*
Ambula-bam	*I did walk,*	*I walked.*
Loque-bam;	*I did ſpeak,*	*I ſpoke.*
Move-bam;	*I did move,*	*I moved.*
Dole-bam;	*I did ail,*	*I ailed.*
Luge-bam;	*I did mourn,*	*I mourned.*
Obie-bam;	*I did die,*	*I died.*
Gaudie-bam;	*I did rejoice,*	*I rejoiced.*
Incipie-bam;	*I did begin,*	*I began.*
Facie-bam;	*I did make,*	*I made.*
Fodie-bam;	*I did dig,*	*I dug.*
Odie-bam;	*I did hate,*	*I hated.*
Ride-bam;	*I did laugh,*	*I laughed.*
Imple-bam;	*I did fill,*	*I filled.*
Abſtinie-bam	*I did forbear,*	*I forbore.*

It is unneceſſary to make any remarks on the Latin words in this example: but in the Engliſh tranſlation we have carefully marked, in the firſt column, the words without any inflection; and, in the ſecond, have put down the ſame meaning by an inflection of our verb; which we have been enabled to do, from a peculiar excellency in our own language unknown to any other, either ancient or modern.—Were it neceſſary to purſue this ſubject farther, we might obſerve, that the *perfect* tenſe in all the conjugations ends univerſally in *I*, the *pluperfect* in ERAM, the *future* in AM or BO; in the ſubjunctive mood, the *imperfect* univerſally in REM, the *perfect* in ERIM, and the *pluperfect* in ISSEM and ERO: and as a ſtill greater ſameneſs is obſervable in the different variations for the perſons in theſe tenſes, ſeeing the firſt perſon plural in all tenſes ends in MUS, and the ſecond perſon in TIS, with little variation in the other perſons; it is evident, that, in reſpect of diverſity of ſounds, this method of conjugating verbs by *inflection*, is greatly inferior to the more natural method of expreſſing the various connections and relations of the verbal attributive by different words, uſually called *auxiliaries*.

The *ſecond* particular by which the different methods of marking the relation of the verbal attributive can affect language, ariſes from the variety of expreſſions, which either of theſe may admit of in uttering the ſame ſentiment.—In this reſpect likewiſe the method of conjugating by inflection ſeems to be deficient. Thus the preſent of the indicative mood in Latin can at moſt be expreſſed only in two ways, *viz.* SCRIBO, and EGO SCRIBO; which ought perhaps in ſtrictneſs to be admitted only as one: whereas, in Engliſh, we can vary it in four different ways, *viz.* *1ſt*, I WRITE; *2dly*, I DO WRITE; *3dly*, WRITE I DO; *4thly*, WRITE DO I*. And if we conſider the further variation which theſe receive in power as well as in ſound, by having the accent placed on the different words; inſtead of four, we will find eleven different variations: thus, *1ſt*, I *write*, with the emphaſis upon the *I*;—*2dly*, *I* WRITE, with the emphaſis upon the word WRITE. Let any one pronounce theſe with the different accent neceſſary, and he will be immediately ſatisfied that they are not only diſtinct from each other with reſpect to meaning, but alſo with regard

* We are ſufficiently aware, that the laſt variation cannot in ſtrictneſs be conſidered as good language: although many examples of this manner of uſing it in ſerious compoſitions, both in poetry and proſe, might be eaſily produced from the beſt authors in the Engliſh language.---But however unjuſtifiable it may be to uſe it in ſerious compoſition; yet, when judiciouſly employed in works of humour, this and other forced expreſſions of the like nature produce a fine effect, by giving a burleſque air to the language, and beautifully contraſting it to the purer diction of ſolid reaſoning. The ſagacious Shakeſpeare has, on many occaſions, ſhewed how ſucceſsfully theſe may be employed in compoſition, particularly in drawing the character of *ancient Piſtol*, in Henry V. Without this liberty, Butler would have found greater difficulty in drawing the inimitable character of Hudibras.--Let this apology ſuffice for our having inſerted this and other variations of the ſame kind; which, although they may be often improper for ſerious compoſition, have ſtill their uſe in language.

regard to found; and the fame muft be underftood of all the other parts of this example.

3. I *do write*,	8. *Write I* DO,
4. *I* DO *write*,	9. WRITE *do I*,
5. *I do* WRITE,	10. *Write* DO *I*,
6. WRITE *I do*,	11. *Write do* I.
7. *Write* I *do*.	

None of the Latin tenfes admit of more variations than the two above mentioned: nor do almoft any of the Englifh admit of fewer than in the above example; and feveral of thefe phrafes, which muft be confidered as exact tranflations of fome of the tenfes of the Latin verb, admit of many more. Thus the imperfect of the fubjunctive mood, which in Latin admits of the above two variations, admits in Englifh of the following:

1. *I might have wrote.*	4. *Wrote might have I.*
2. *Wrote I might have.*	5. *I wrote might have.*
3. *Have wrote I might.*	6. *Have wrote might I.*

And if we likewife confider the variations which may be produced by a variation of the emphafis, they will be as under.

1. I *might have wrote.*	13. WROTE *might have I.*
2. *I* MIGHT *have wrote.*	14. *Wrote* MIGHT *have I.*
3. *I might* HAVE *wrote.*	15. *Wrote might* HAVE *I.*
4. *I might have* WROTE.	16. *Wrote might have* I.
5. WROTE *I might have.*	17 I *wrote might have.*
6. *Wrote* I *might have.*	18. *I* WROTE *might have.*
7. *Wrote I* MIGHT *have.*	19. *I wrote* MIGHT *have.*
8. *Wrote I might* HAVE.	20. *I wrote might* HAVE.
9. HAVE *wrote I might.*	21 HAVE *wrote might I.*
10. *Have* WROTE *I might.*	22. *Have* WROTE *might I.*
11. *Have wrote* I *might.*	23. *Have wrote* MIGHT *I.*
12. *Have wrote I* MIGHT.	24. *Have wrote might* I.

In all twenty-four variations, inftead of two.—If we likewife confider, that the Latins were obliged to employ the fame word, not only to exprefs "I *might* have wrote." but alfo "I *could*, I *would*, or I *fhould* have wrote," each of which would admit of the fame variations as the word *might*, we have in all *ninety-fix* different expreffions in Englifh for the fame phrafe which in Latin admits only of two, unlefs they have recourfe to other forced turns of expreffion, which the defects of their verbs in this particular has compelled them to invent.

But, if it fhould be objected, that the laft circumftance we have taken notice of as a defect, can only be confidered as a defect of the Latin language, and is not to be attributed to the *inflection* of their verbs, feeing they might have had a particular tenfe for each of thefe different words *might*, *could*, *would*, and *fhould*; we anfwer, that, even admitting this excufe as valid, the fuperiority of the analogous language, as fuch, ftill remains in this refpect as twelve to one.—Yet even this conceffion is greater than ought to have been made: For as the difficulty of forming a fufficient variety of words for all the different modifications which a verb may be made to undergo is too great for any rude people to be able to overcome; we find, that every nation which has adopted this mode of inflection, not excepting the Greeks themfelves, has been obliged to remain fatisfied with fewer words than would have been neceffary even to effect this purpofe, and make the fame word ferve a double, treble, or even quadruple office, as in the Latin tenfe which gave rife to thefe obfervations: So that however in phyfical neceffity this may not be chargeable upon this particular mode of conftruction, yet in moral certainty this muft always be the cafe; and therefore we may fafely conclude, that the mode of varying verbs by *inflection* affords lefs variety in the arrangement of the words of the particular phrafes, than the method of varying them by the help of auxiliaries.

But if there fhould ftill remain any fhadow of doubt in the mind of the reader, whether the method of varying the verbs by *inflection*, is inferior to that by *auxiliaries*, with regard to diverfity of founds, or variety of expreffion; there cannot be the leaft doubt, but that, with refpect to precifion, diftinctnefs, and accuracy in expreffing any idea, the latter enjoys a fuperiority beyond all comparifon.—Thus the Latin verb *Amo*, may be Englifhed either by the words *I love*, or *I do love*, and the emphafis placed upon any of the words that the circumftances may require; by means of which, the meaning is pointed out with a force and energy which it is altogether impoffible to produce by the ufe of any fingle word. The following line from Shakefpear's Othello may ferve as an example;

——Excellent wretch!
Perdition catch my foul, but *I* DO *love* thee:

In which the ftrong emphafis upon the word DO, gives it a force and energy which conveys, in an irrefiftible manner, a moft perfect knowledge of the fituation of the mind of the fpeaker at the time.—That the whole energy of the expreffion depends upon this feemingly infignificant word, we may be at once fatisfied of, by keeping it away in this manner;

——Excellent wretch!
Perdition catch my foul, but *I love* thee.

How poor—how tame—how infignificant is this, when compared with the other! Here nothing remains but a tame affertion, ufhered in with a pompous exclamation which could not here be introduced with any degree of propriety. Whereas, in the way that Shakefpear has left it to us, it has a forcible power which nothing can furpafs; for, overpowered with the irrefiftible force of Defdemona's charms, this ftrong exclamation is forced from the foul of Othello in fpite of himfelf. Surprifed at this tender emotion which brings to his mind all thofe amiable qualities for which he had fo much efteemed her, and at the fame time fully impreffed with the firm perfuafion of her guilt, he burfts out into that feemingly inconfiftent exclamation—*Excellent wretch!* And then he adds in the warmth of his furprife,——thinking it a thing moft aftonifhing that any warmth of affection fhould ftill remain in his breaft, he even confirms it with an oath,—"*Perdition catch my foul, but I* DO *love thee.*"—"In fpite of all the falfehoods with which I know thou haft deceived me—in fpite of all the crimes of which I know thee guilty—in fpite of all thefe reafons for which I ought to hate thee—in fpite of myfelf,—ftill I find that I love,—yes, I DO love thee."—We look upon it as a thing altogether impoffible to tranf-

fufe

fuſe the energy of this expreſſion into any language whoſe verbs are regularly inflected.

In the ſame manner we might go through all the other tenſes, and ſhew that the ſame ſuperiority is to be found in each.—Thus in the *perfect tenſe* of the Latins, inſtead of the ſimple AMAVI, we ſay, I HAVE LOVED; and by the liberty we have of putting the emphaſis upon any of the words which compoſe this phraſe, we can in the moſt accurate manner fix the preciſe idea which we mean to excite: for if we ſay *I have loved*, with the emphaſis upon the word I, it at once points out the perſon as the principal object in that phraſe, and makes us naturally look for a contraſt in ſome other perſon, and the other parts of the phraſe become ſubordinate to it;—"HE *has loved* thee much, but I *have loved* thee infinitely more"—The Latins too, as they were not prohibited from joining the pronoun with their verb, were alſo acquainted with this excellence, which Virgil has beautifully uſed in this verſe:

——————Nos *patriam fugimus;*
Tu, *Tytere*, *lentis in umbra*, &c.

But *we* are not only enabled thus to diſtinguiſh the perſon in as powerful a manner as the Latins, but can alſo with the ſame facility point out any of the other circumſtances as principals; for if we ſay, with the emphaſis upon the word *Have*, "I HAVE *loved*," it as naturally points out the time as the principal object, and makes us look for a contract in that peculiarity, *I* HAVE: "I *have* loved indeed;—my imagination *has* been led aſtray—my reaſon *has* been perverted:—but, *now* that time has opened my eyes, I can ſmile at thoſe imaginary diſtreſſes which once perplexed me."—In the ſame manner we can put the emphaſis upon the other word of the phraſe *loved*,—"I *have* LOVED."—Here the paſſion is exhibited as the principal circumſtance; and as this can never be excited without ſome object, we naturally wiſh to know the object of that paſion—"Who! what have you *loved?*" are the natural queſtions we would put in his caſe. "I have LOVED ——Eliza."——In this manner we are, on all occaſions, enabled to expreſs, with the utmoſt preciſion, that particular idea which we would wiſh to excite, ſo as to give an energy and perſpicuity to the language, which can never be attained by thoſe languages whoſe verbs are conjugated by inflection; and if to this we add the inconconvenience which all inflected languages are ſubjected to, by having too ſmall a number of tenſes, ſo as to be compelled to make one word on many occaſions ſupply the place of two, three, or even four, the balance is turned ſtill more in our favours.—Thus, in Latin, the ſame word AMABO ſtands for *ſhall* or *will* love, ſo that the reader is left to gueſs from the context which of the two meanings it was moſt likely the writer had in view.—In the ſame manner, *may* or *can* love are expreſſed by the ſame word AMEM; as is alſo *might*, *could*, *would*, or *ſhould* love, by the ſingle word AMAREM, as we have already obſerved; ſo that the reader is left to gueſs which of theſe four meanings the writer intended to expreſs; which occaſions a perplexity very different from that clear preciſion which our language allows of, by not only pointing out the different words, but alſo by allowing us to put the emphaſis upon any of them we pleaſe, which ſuperadds energy and force to the preciſion it would have had without that of aſſiſtance.

Upon the whole, therefore, after the moſt candid examination, we muſt conclude, that the method of conjugating verbs by *inflection* is inferior to that which is performed by the help of *auxiliaries*;—becauſe it does not afford ſuch a diverſity of ſounds,—nor allow ſuch variety in the arrangement of expreſſion for the ſame thought,—nor give ſo much diſtinction and preciſion in the meaning.——It is, however, attended with one conſiderable advantage above the other method: for as the words of which it is formed are neceſſarily of greater length, and more ſonorous, than in the analogous languages, it admits of a more flowing harmony of expreſſion; for the number of monoſyllables in this laſt greatly checks that pompous dignity which naturally reſults from longer words. Whether this ſingle advantage is ſufficient to counterbalance all the other defects with which it is attended, is left to the judgment of the reader to determine:—but we may remark, before we quit the ſubject, that even this excellence is attended with ſome peculiar inconveniences, which ſhall be more particularly pointed out in the ſequel.

But perhaps it might ſtill be objected, that the compariſon we have made above, although it may be fair, and the concluſion juſt with regard to the Latin and Engliſh languages; yet it does not appear clear, that on that account the method of conjugating verbs by *inflection* is *inferior* to that by *auxiliaries:* for although it be allowed, that the Latin language is defective in point of tenſes; yet if a language were formed which had a ſufficient number of inflected tenſes to anſwer every purpoſe; if it had, for inſtance, a word properly formed for every variation of each tenſe; one for *I love*, another for *I do love;* one for *I ſhall*, another for *I will love;* one for *I might*, another for *I could*, and *would*, and *ſhould* love; and ſo on through all the other tenſes; that this lanouage would not be liable to the objections we have brought againſt the inflection of verbs; and that of courſe, the objections we have brought are only valid againſt thoſe languages which have followed that mode and executed it imperfectly.——We anſwer, that although this would in ſome meaſure remedy the evil, yet it would not remove it entirely. For in the firſt place, unleſs every verb, or a very ſmall number of verbs, was conjugated in one way, having the ſound of the words in each tenſe, and diviſions of tenſes, as we may ſay, different from all the other conjugations,—it would always occaſion a ſameneſs of ſounds which would in ſome meaſure prevent that variety of ſounds ſo proper for a language. And even if this could be effected, it would not give ſuch a latitude to the expreſſion as auxiliaries allow: for although there ſhould be two words, one for *I might*, and another for *I could* love; yet as theſe are ſingle words, they cannot be varied; whereas, by auxilaries, either of theſe can be varied twenty-four different ways, as has been ſhewn above.—In the laſt place, no ſingle word can ever expreſs all that variety of meaning which we can do by the help of our auxilaries and the emphaſis. *I have loved*, if expreſſed by any one word, could only denote at all times one diſtinct meaning; ſo that, to give it

it the power of ours, there behoved to be three diſtinct words at leaſt. However, if all this was done ;—that is, if there was a diſtinct conjugation formed for every forty or fifty verbs;—if each of the tenſes was properly formed, and all of them different from every other tenſe as well as every other verb; and theſe all carried through each of the different perſons, ſo as to be all different from one another;—and if likewiſe there was a diſtinct word to mark each of the ſeparate meanings which the ſame tenſe could be made to aſſume by means of the emphaſis;—and if all this infinite variety of words could be formed in a diſtinct manner, different from each other and harmonious;—this language would have powers greater than any that could be formed by auxiliaries, if it were poſſible for the human powers to acquire ſuch a degree of knowledge as to be able to employ it with facility. But how could this be attained, ſince upwards of ten thouſand words would be neceſſrty to form the variations of any one verb, and a hundred times that number would not include the knowledge of the verbs alone of ſuch a language *?—How much, therefore, ought we to admire the ſimple perſpicuity of our language, which which enables us, by the proper application of ten or twelve ſeemingly trifling words, the meaning and uſe of which can be attained with the utmoſt eaſe, to expreſs all that could be expreſſed by this unwieldy apparatus? What can equal the ſimplicity or the power of the one method, but the well-known powers of the twenty-four letters, the knowledge of which can be obtained with ſo much eaſe—and their power knows no limits?—or what can be compared to the fancied perfection of the other, but the tranſcrpt of it which the Chineſe ſeem to have formed in their unintelligible language?

Having thus conſidered pretty fully the advantages and defects of each of theſe two methods of varying verbs, we cannot help feeling a ſecret wiſh ariſe in our mind, that there had been a people ſagacious enough to have united the powers of the one method with thoſe of the other;—nor can we help being ſurpriſed, that, among the changes which took place in the ſeveral languages of Europe after the downfall of the Roman monarchy, ſome of them did not accidentally ſtumble on the method of doing it.—From many concurring circumſtances, it ſeems probable, that the greateſt part, if not all the Gothic nations that over-ran Italy at that time, had their verbs varied by the help of auxiliaries; and many of the modern European languages which have ſprung from them, have ſo far borrowed from the Latin, as to have ſome of the tenſes of their verbs inflected: yet the Engliſh alone have in any inſtance combined the joint powers of the two: which could only be done by forming inflections for the different tenſes in the ſame manner as the Latins, and at the ſame time retaining the original method of varying them by auxiliaries; by which means either the one or the other method could have been employed as occaſion required. —We have luckily two tenſes formed in that way; the *preſent* of the indicative, and the *paſt*. In almoſt all our verbs theſe can be declined either with or without auxiliaries. Thus the preſent, without an auxiliary, is, *I love*, *I write*, *I ſpeak*; with an auxiliary, *I do write*, *I do love*, *I do ſpeak*. In the ſame manner, the paſt tenſe, by inflection, is, *I loved*, *I wrote*, *I ſpoke*; by auxiliaries, *I did love*, *I did ſpeak*, *I did write*. Every author, who knows any thing of the power of the Engliſh language, knows the uſe which may be made of this diſtinction. What a pity is it that we ſhould have ſtopt ſhort ſo ſoon? how blind was it in ſo many other nations to imitate the defects, without making a proper uſe of that beautiful language which is now numbered among the dead?

After the verbs, the next moſt conſiderable variation we find between the *Analogous* and *tranſpoſitive* languages, is in the nouns; the latter varying the different caſes of theſe by *inflection*; whereas the former expreſs all the different variations of them by the help of other words prefixed, called *prepoſitions*. Now, if we conſider the advantages or diſadvantages of either of theſe methods under the ſame heads as we have done the verbs, we will find, that with regard to the firſt particular, *viz.* variety of ſounds, almoſt the ſame remarks may be made as upon the verbs;—for if we compare any particular noun by itſelf, the variety of ſound appears much greater between the different caſes in the *Tranſpoſitive*, than between the tranſlation of theſe in the *Analogous* language. Thus, REX, REGIS, REGI, REGEM, *&c.* are more diſtinct from one another in point of ſound, than the tranſlation of theſe, *a king*, *of a king*, *to a king*, *a king*, &c. But if we proceed one ſtep further, and conſider the variety which is produced in the language *in general*, by the one or the other of theſe methods, the caſe is entirely reverſed. For as it would have been impoſſible to form diſtinct variations, different from one another, for each caſe of every noun, they have been obliged to reduce all their nouns into a few general claſſes, called *declenſions*, and endowed all of thoſe included under each claſs with the ſame termination in every caſe; which produces a like ſimilarity of ſound with what we already obſerved was occaſioned to the verbs from the ſame cauſe; whereas in the analogous languages, as there is no neceſſity for any conſtraint, there is almoſt as great a variety of ſounds as there are of nouns. The Latins have only five different declenſions, ſo that all the great number of words of this general order muſt be reduced to the very ſmall diverſity of ſounds which theſe few claſſes admit of; and even the ſounds of theſe few claſſes are not ſo much diverſified as they ought to have been, as many of the different *caſes* in the different *declenſions* have exactly the ſame ſounds, as we ſhall have occaſion to remark more fully hereafter.—We might here produce examples to ſhew the great *ſimilarity* of ſounds between different nouns in the Latin language, and *variety* in the Engliſh, in the ſame way as we did of the verbs: but as every reader, in the leaſt acquainted

* This aſſertion may perhaps appear to many very much exaggerated: but if any ſhould think ſo, we only beg the favour that he will ſet himſelf to mark all the variation of tenſes, mode, perſon, and number, which an Engliſh verb can be made to aſſume, varying each of theſe in every way that it will admit, both as to the diverſity of expreſſions, and the emphaſis; he will ſoon be convinced that we have here ſaid nothing more than enough.

acquainted with theſe two languages, can ſatisfy himſelf in this particular, without any further trouble than by marking down any number of Latin nouns, with their tranſlations in Engliſh; we thought it unneceſſary to dwell longer on this particular.

But if the inflection of nouns is a diſadvantage to a language in point of diverſity of ſounds, it is very much the reverſe with regard to the variety it allows in the arranging the words of the phraſe. Here, indeed, the Tranſpoſitive language ſhines forth in all its glory, and the Analogous muſt yield the palm without the ſmalleſt diſpute. For as the *nominative caſe* (or that noun which is the cauſe of that energy expreſſed by the verb) is different from the *accuſative* (or that noun upon which the energy expreſſed by the verb is exerted) theſe may be placed in any ſituation that the writer ſhall think proper, without occaſioning the ſmalleſt confuſion: whereas in the analogous languages, as theſe two different ſtates of the noun are expreſſed by the ſame word, they cannot be diſtinguiſhed but by their poſition alone; ſo that the noun which is the efficient cauſe muſt always precede the verb, and that which is the active ſubject muſt follow; which greatly cramps the harmonious flow of compoſition. —Thus the Latins, without the ſmalleſt perplexity in the meaning, could ſay either *Brutum amavit Caſſius*, or *Caſſius amavit Brutum*, or *Brutum Caſſius amavit*, or *Caſſius Brutum amavit*. As the termination of the word *Caſſius* always points out that it is in the *nominative caſe*, and therefore that he is the perſon from whom the energy proceeds; and in the ſame manner, as the termination of the word *Brutum* points out that it is in the *accuſative caſe*, and conſequently that he is the object upon which the energy is exerted; the meaning continues ſtill diſtinct and clear, notwithſtanding of all theſe ſeveral variations: whereas in the Engliſh language, we could only ſay *Caſſius loved Brutus*, or, by a more forced phraſeology, *Caſſius Brutus loved*: Were we to reverſe the caſe, as in the Latin, the meaning alſo would be reverſed; for if we ſay *Brutus loved Caſſius*, it is evident, that, inſtead of being the perſon beloved, as before, *Brutus* now becomes the perſon from whom the energy proceeds, and *Caſſius* becomes the object beloved.—In this reſpect, therefore, the analogous languages are greatly inferior to the tranſpoſitive; and indeed it is from this ſingle circumſtance alone that they derive their chief excellence.

But although it thus appears evident, that any language, which has a particular variation of its nouns to diſtinguiſh the *accuſative* from the *nominative caſe*, has an advantage over thoſe languages which have none; yet it does not appear that any other of their *caſes* adds to the variety, but rather the reverſe: for, in Latin, we can only ſay *Amor Dei;* in Engliſh the ſame phraſe may be rendered, either,—*the love of God*,—*of God the love*,—or, by a more forced arrangement, *God the love of*. And as theſe oblique caſes, as the Latins called them, except the accuſative, are clearly diſtinguiſhed from one another, and from the nominative, by the prepoſition which accompanies them, we are not confined to any particular arrangement with regard to theſe as with the accuſative, but may place them in what order we pleaſe, as in Milton's elegant invocation at the beginning of Paradiſe Loſt:—

Of man's firſt diſobedience, and the fruit
Of that forbidden tree, whoſe mortal taſte
Brought death into the world, and all our wo,
With loſs of Eden, till one greater Man
Reſtore us, and regain the bliſsful ſeat,
Sing, heavenly muſe.

In this ſentence the tranſpoſition is almoſt as great as the Latin language would admit of, and the meaning as diſtinct as if Milton had begun with the plain language of proſe, thus,—"Heavenly muſe, ſing of man's firſt diſobedience," *&c.*

Before we leave this head, we may remark, that the little attention which ſeems to have been paid to this peculiar advantage derived from the uſe of an accuſative caſe different from the nominative, is ſomewhat ſurpriſing.—The Latins, who had more occaſion to attend to this with care than any other nation, have in many caſes overlooked it, as is evident from the many inſtances we meet with in their language where this is not diſtinguiſhed. For the nominative and accuſative are the ſame in the ſingular number of all thoſe of the firſt declenſion ending in E; as is likewiſe the caſe with thoſe in UM of the ſecond, in E of the third, and in U of the fourth. In the plural number, there is no diſtinction between theſe two caſes in thoſe of the ſecond declenſion ending in UM, nor in all thoſe of the third, fourth, and fifth, of every termination, the number of which is very conſiderable. So that their language reaps no advantage in this reſpect from almoſt one half of their nouns. Nor have any of the modern languages in Europe, however much they may have borrowed from the ancient languages in other reſpects, attempted to copy from them in this particular; from which perhaps more advantage would have been gained, than from copying all the other ſuppoſed excellencies of their language.—But to return to our ſubject.

It remains that we conſider, whether the inflection of nouns gives any advantage over the method of defining them by prepoſitions, in point of diſtinctneſs and preciſion of meaning.—But in this reſpect too the analogous language muſt come off victorious.—Indeed this is the particular in which their greateſt excellence conſiſts; nor was it, we believe, ever diſputed, but that, in point of accuracy and preciſion, this method muſt excel all others, however it may be defective in other reſpects.—We obſerved under this head, when ſpeaking of verbs, that it might perhaps be poſſible to form a language by inflection which ſhould be capable of as great accuracy as in the more ſimple order of auxiliaries: but this would have been ſuch an infinite labour, that it was not to be expected that ever human powers would have been able to accompliſh it. More eaſy would it have been to have formed the ſeveral inflections of the nouns ſo different from one another, as to have rendered it impoſſible ever to miſtake the meaning. Yet even this has not been attempted. And as we find that thoſe languages which have adopted the method of inflecting their verbs are more imperfect in point of preciſion than the other, ſo the ſame may be ſaid of inflecting the nouns: for, not to mention the energy which

which the analogous languages acquire by putting the accent upon the noun, or its prepoſition (when in an oblique caſe), according as the ſubject may require, to expreſs which variation of meaning no particular variety of words have been invented in any inflected language, they are not even complete in other reſpects.—The Latin, in particular, is in many caſes defective, the ſame termination being employed in many inſtances for different caſes of the ſame noun.—Thus the genitive and dative ſingular, and nominative and vocative plural, of the firſt declenſion, are all exactly alike, and can only be diſtinguiſhed from one another by the formation of the ſentences;—as are alſo the nominative, vocative and ablative ſingular, and the dative and ablative plural. In the ſecond, the genitive ſingular, and nominative and vocative plural, are the ſame; as are alſo the dative and ablative ſingular, and dative and ablative plural; except thoſe in UM, whoſe nominative, accuſative, and vocative ſingular, and nominative, accuſative and vocative plural, are alike. The other three declenſions agree in as many of their caſes as theſe do; which evidently tends to perplex the meaning, unleſs the hearer is particularly attentive to, and well acquainted with, the particular conſtruction of the other parts of the ſentence; all of which is totally removed, and the cleareſt certainty exhibited, at once, by the help of prepoſitions in the analogous languages.

It will hardly be neceſſary to enter into ſuch a minute examination of the advantages or diſadvantages attending the variation of *adjectives;* as it will appear evident, from what has been already ſaid, that the endowing them with terminations ſimilar to, and correſponding with the nouns, muſt tend ſtill more and more to increaſe the ſimilarity of ſounds in any language, than any of thoſe particulars we have already taken notice of; and were it not for the liberty which they have, in tranſpoſitive languages, of ſeparating the adjective from the noun, this muſt have occaſioned ſuch a jingle of ſimilar ſounds as behoved to have been moſt diſguſting to the ear: but as it would have been impoſſible in many caſes, in thoſe languages where the verbs and nouns are inflected, to have pronounced the words which ought to have followed each other, unleſs their adjectives could have been ſeparated from the nouns; therefore, to remedy this inconvenience, they were forced to deviſe this unnatural method of inflecting them alſo; by which means it is eaſy to recognize to what noun any adjective has a reference, in whatever part of the ſentence it may be placed.—In theſe languages, therefore, this inflection, both as to gender, number, and caſe, becomes abſolutely neceſſary; and, by the diverſity which it admitted in the arranging the words of the ſeveral phraſes, might counterbalance the jingle of ſimilar ſounds which it introduced into the language.—But what ſhall we ſay of thoſe European nations, who, although poſſeſſed of a language in every reſpect different from the tranſpoſitive idiom, have neverthelefs adopted the variations of their adjectives in the fulleſt ſenſe? for here they have nothing to counterbalance this diſagreeable jingle of ſimilar ſounds, ſo deſtructive of all real harmony.—In the days of monkiſh ignorance, when this cuſtom was probably introduced, the claſhing of words with one another might be eſteemed an ornament; but now that mankind have attained a higher ſenſe of harmony and propriety, we in Britain may felicitate ourſelves to find, that our language has eſcaped this mark of barbarity, which ſo many others are now ſubjected to.

Having thus examined the moſt ſtriking particulars in which the tranſpoſitive and analogous languages differ, and endeavoured to ſhow the general tendency of every one of the particulars ſeparately, it would not be fair to diſmiſs the ſubject without conſidering each of theſe as a whole, and pointing out their general tendency in that light: for we all know, that it often happens in human inventions, that every part which compoſes a whole, taken ſeparately, may appear extremely fine; and yet, when all theſe parts are put together, they may not agree, but produce a jarring and confuſion very different from what we might have expected. We therefore imagine a few remarks upon the genius of each of theſe two diſtinct IDIOMS of language conſidered as a whole will not be deemed uſeleſs.

Although all languages agree in this reſpect, that they are the means of conveying the ideas of one man to another; yet as there are an infinite variety of ways in which we might wiſh to convey theſe ideas, ſometimes by the eaſy and familiar mode of converſation, and at other times by more ſolemn addreſſes to the underſtanding, by pompous declamation, *&c.* it may ſo happen, that the genius of one language may be more properly adapted to the one of theſe than the other, while another language may excel in the oppoſite particular. This is exactly the caſe in the two general IDIOMS of which we now treat.—Every particular in a *tranſpoſitive* language, is peculiarly calculated for that ſolemn dignity which is neceſſary for pompous orations. Long ſounding words, formed by the inflection of the different parts of ſpeech,—flowing periods, in which the attention is kept awake by the harmony of the ſounds, and an expectation of that word which is to unravel the whole,—if compoſed by a ſkilful artiſt, are admirably ſuited to that ſolemn dignity and awful grace which conſtitute the eſſence of a public harangue. On the contrary, in private converſation, where the mind wiſhes to unbend itſelf with eaſe, theſe become ſo many cloggs which encumber and perplex. At theſe moments we wiſh to transfuſe our thoughts with eaſe and facility—we are tired with every unneceſſary ſyllable—and wiſh to be freed of the trouble of attention as much as may be. Like our ſtate-robes, we would wiſh to lay aſide our pompous language, and enjoy ourſelves at home with freedom and eaſe. Here the ſolemnity and windings of the *tranſpoſitive* language are burdenſome; while the facility with which a ſentiment can be expreſſed in the the *analogous* language is the thing that we wiſh to acquire.—In this humble, though moſt engaging ſphere, the analogous language moves unrivalled;—in this it wiſhes to indulge, and never tires. But it in vain attempts to rival the *tranſpoſitive* in dignity and pomp: The number of monoſyllables interrupt the flow of harmony; and altho' they may give a greater variety of ſounds, yet they do not naturally poſſeſs that dignified gravity which ſuits the other language. This, then, muſt be conſidered as the ſtriking particular in the genius of theſe two different IDIOMS, which marks their characters.

If

If we confider the effects which thefe two different characters of language muft naturally produce upon the people who employ them, we will foon perceive, that the genius of the *analogous* language is much more favourable for the moft engaging purpofes of life, the civilizing the human mind by mutual intercourfe of thought, *than the tranfpofitive*. For as it is chiefly by the ufe of fpeech that man is raifed above the brute creation;—as it is by this means he improves every faculty of his mind, and, to the obfervations which he may himfelf have made, has the additional advantage of the experience of thofe with whom he may converfe, as well as the knowledge which the human race have acquired by accumulated experience of all preceding ages;—as it is by the enlivening glow of converfation that kindred fouls catch fire from one another, that thought produces thought, and each improves upon the other, till they foar beyond the bounds which human reafon, if left alone, could ever have afpired to;—we muft furely confider that language as the moft beneficial to fociety, which moft effectually removes thefe bars that obftruct its progrefs. Now, the genius of the *analogous* languages is fo eafy, fo fimple and plain, as to be within the reach of every one who is born in the kingdom where it is ufed, to fpeak it with facility; even the rudeft among the vulgar can hardly fall into any grammatical errors: whereas, in the *tranfpofitive* languages, fo many rules are neceffary to be attended to, and fo much variation is produced in the meaning by the flighteft variations in the found, that it requires a ftudy far above the reach of the illiterate mechanic ever to attain. So that, how perfect foever the language may be when fpoken with purity, the bulk of the nation muft ever labour under the inconvenience of rudenefs and inacurracy of fpeech, and all the evils which this naturally produces.—Accordingly we find, that in Rome, a man, even in the higheft rank, received as much honour, and was as much diftinguifhed among his equals, for being able to converfe with eafe, as a modern author would be for writing in an eafy and elegant ftyle; and Cæfar among his cotemporaries was as much efteemed for his fuperiority in fpeaking the language in ordinary converfation with eafe and elegance, as for his powers of oratory, his fkill in arms, or his excellence in literary compofition. It is needlefs to point out the many inconveniences that this behoved to produce in a ftate. It is fufficient to obferve, that it naturally tends to introduce a vaft diftinction between the different orders of men; to fet an impenetrable barrier between thofe born in a high and thofe born in a low ftation; to keep the latter in ignorance and barbarity, while it elevates the former to fuch a height as muft fubject the other to be eafily led by every popular demagogue.—How far the hiftory of the nations who have followed this IDIOM of language confirms this obfervation, every one is left to judge for himfelf.

Having thus confidered LANGUAGE in general, and pointed out the genius and tendency of the two moft diftinguifhed IDIOMS which have prevailed; we fhall clofe thefe remarks with a few obfervations upon the particular nature and genius of thofe language which are now chiefly ftudied or fpoken in Europe.

Of all the nations whofe memory hiftory has tranfmitted to us, none have been fo eminently diftinguifhed for their literary accomplifhments, as well as acquaintance with the polite arts, as the Greeks; nor are we as yet acquainted with a language poffeffed of fo many advantages, with fo few defects, as that which they ufed, and which continues ftill to be known by their name.—The neceffary connection between the progrefs of knowledge and the improvement of language has been already explained; fo that it will not be furprifing to find their progrefs in the one keep pace with that of the other: but it will be of utility to point out fome advantages which that diftinguifhed people poffeffed, which other nations, perhaps not lefs diftinguifhed for talents or tafte, have not enjoyed, which has contributed to render their language the moft univerfally admired in ancient as well as in modern times.

As it is probable, that many different focieties of men, in the early ages of antiquity, may have found themfelves in fuch circumftances as to be obliged to invent a language to themfelves; each would naturally adopt thofe founds into their language which chance might fuggeft, or were moft agreeable to their perception of harmony, or moft confonant to the difpofition of mind of the original inventors; in the fame manner as we fee that each compofer of mufic has a particular fpecies of founds of which he is fonder than any other, which will predominate through all his compofitions, and give them a certain characteriftic tone by which they may be diftinguifhed from that of other compofers:—So the language of each particular fet of people would have originally a certain characteriftic tone of harmony, which would diftinguifh it from all others; and behoved to be more or lefs perfect, according to the greater or lefs degree of that delicate fenfe of harmony, diftinguifhed by the name of *tafte*, which thefe original inventors were poffeffed of. Thefe founds, then, being once eftablifhed by cuftom, would become familiar to the ear of the defcendents of thefe particular tribes: new words would be invented as knowledge increafed; but thefe behoved to be modulated fo as to be agreeable to the general tenor of their language, from the neceffity of making it confonant as well to the organs of hearing as the organs of fpeech.—Hence it happens, that the characteriftic tones of a language are preferved much longer without variation than any other particular relating to it; and if it change at all, the change muft be flow and imperceptible. Knowledge after this may increafe;—tafte may be improved;—it may be perceived that the language is not copious enough to exprefs the ideas, or harmonious enough to pleafe the ear of the compofer;—he may readily invent words to fupply the deficiency in that refpect; but the founds in a great meafure remain without the reach of his power, and he muft reft fatisfied with thefe, fuch as they are, without attempting innovations.——Happy therefore, in this refpect, muft we deem thofe nations, whofe earlieft anceftors have been fo fortunate as to adopt no unharmonious founds into their language, whereby they are freed from one bar to the cultivating thofe refined pleafures which proceed from the ufe of a delicate tafte, which others may perhaps never be able to furmount:—and in this refpect no nation was ever fo eminently diftinguifhed as the

the Greeks; which no doubt contributed its ſhare to promote that general elegance and harmony of proportion which prevailed in all their arts. The original ſounds and fundamental tones of that language are the moſt harmonious, and the moſt agreable to the ear, of any that have hitherto been invented; inſomuch, that from this principle alone the ſound of their language is agreeable to every nation who have heard it, even when the meaning of the words are not underſtood; whereas almoſt all other languages, till they are underſtood, appear, to an ear which has not been accuſtomed to them, jarring and diſcordant. This is the fundamental excellence of that juſtly admired language; nor have the people failed to improve this to the utmoſt of their power, by many aids of their own invention.—The Greek language is of the *tranſpoſitive* kind: but a people ſo lively, ſo acute, and ſo loquacious, could ill bear the ceremonious reſtraint which that mode of language naturally ſubjected them to; and have therefore, by various methods, freed it in a great meaſure from the ſtiffneſs which that produced. In inflecting their nouns and verbs, they ſometimes prefix a ſyllable, and ſometimes add one; which, beſides the variety that it gives to the ſounds of the language, adds greatly to the diſtinctneſs, and admits of a more natural arrangement of the words than in the Latin, and of conſequence renders it much fitter for the eaſineſs of private converſation: and indeed, the genius of the people ſo far prevailed over the *idiom* of the language, as to render it, in the age of its greateſt perfection, capable of almoſt as much eaſe, and requiring almoſt as little tranſpoſition of words, as thoſe languages which have been called analogous. But as thoſe nations who ſpoke this language were all governed by popular aſſemblies, and as no authority could be obtained among them but by a ſkill in rhetoric and the powers of perſuaſion; it became neceſſary for every one, who wiſhed to acquire power or conſideration in the ſtate, to improve himſelf in the knowledge of that language, in the uſe of which alone he could expect honours or reputation. Hence it happened, that while the vivacity of the people rendered it eaſy, the great men ſtudiouſly improved every excellence that it could reap from its powers as a *tranſpoſitive* language; ſo that, when brought to its utmoſt perfection by the amazing genius of the great Demoſthenes, it attained a power altogether unknown to any other language.—Thus happily circumſtanced, the Greek language arrived at that envied pre-eminence which it ſtill juſtly retains. From the progreſs of arts and ſciences; from the gaiety and inventive genius of the people; from the number of free ſtates into which Greece was divided, each of which invented words of its own, all of which contributed to the general ſtock; and from the natural commutation which took place between theſe ſtates, which excited in the ſtrongeſt degree the talents of the people; it acquired a copiouſneſs unknown to any ancient language, and excelled by few of the moderns.—In point of harmony of numbers, it is altogether unrivalled; and on account of the eaſe as well as dignity which it admitted of from the cauſes aſſigned above, it admits of perfection in a greater number of particular kinds of compoſition than any other language ever known.—The irreſiſtible force and overwhelming impetuoſity of *Demoſthenes* ſeems not more natural to the genius of the language; than the more flowery charms of Plato's calm and harmonious cadences, or the unadorned ſimplicity of Xenophon; nor does the majeſtic pomp of Homer ſeem to be more naturally adapted to the genius of the language, than the more humble ſtrains of Theocritus, or the laughing feſtivity of Anacreon: Equally adapted to all purpoſes, when we peruſe any of theſe authors, we would imagine the language was moſt happily adapted for his particular ſtyle alone The ſame powers it likewiſe in a great meaſure poſſeſſed for converſation; and the dialogue ſeems not more natural for the dignity of Sophocles or Euripides, than for the more eaſy tenderneſs of Menander, or buffoonery of Ariſtophanes.—With all theſe advantages, however, it muſt be acknowledged, that it did not poſſeſs that unexceptionable clearneſs of meaning, which ſome analogous languages enjoy, or that characteriſtic force which the accent has power to give it, were not theſe defects counterbalanced by other cauſes which we ſhall afterwards point out.

The Romans, a people of fierce and warlike diſpoſitions, for many ages during the infancy of their republic, more intent on purſuing conqueſts and military glory, than in making improvements in literature or the fine arts, beſtowed little attention to their language. Of a diſpoſition leſs ſocial and more phlegmatic than the Greeks, they gave themſelves no trouble about rendering their language fit for converſation; and it remained ſtrong and nervous, but, like their ideas, was limited and confined. More diſpoſed to command reſpect by the power of their arms than by the force of perſuaſion, they deſpiſed the more effeminate powers of ſpeech: ſo that, before the Punic wars, their language was perhaps more reſerved and uncourtly than any other at that time known.—But after their rival Carthage was deſtroyed, and they had no longer that powerful curb upon their ambition; when riches flowed in upon them by the multiplicity of that conqueſts;—luxury began to prevail, the ſtern auſterity of their manners to relax, and ſelfiſh ambition to take place of that diſintereſted love for their country ſo eminently conſpicuous among all orders of men before that period.—Popularity began then to be courted: ambitious men, finding themſelves not poſſeſſed of that merit which inſured them ſucceſs with the virtuous ſenate, amuſed the mob with artful and ſeditious harangues; and by making them believe that they were poſſeſſed of all power, and had their ſacred rights encroached upon by the ſenate, led them about at their pleaſure, and got themſelves exalted to honours and riches by theſe inſidious arts. It was then the Romans firſt began to perceive the uſe to which a command of language could be put.—Ambitious men then ſtudied it with care, to be able to accompliſh their ends; while the more virtuous were obliged to acquire a ſkill in this, that they might be able to repel the attacks of their adverſaries.—Thus it happened, that in a ſhort time that people, from having entirely neglected, began to ſtudy their language with the greateſt aſſiduity; and as Greece happened to be ſubjected to the Roman yoke about that time, and a friendly intercourſe was eſtabliſhed between theſe two countries, this greatly conſpired to nouriſh in the minds

minds of the Romans a taste for that art of which they had lately become so much enamoured. Greece had, long before this period, been corrupted by luxury; their taste for the fine arts had degenerated into unnecessary refinement; and all their patriotism consisted in popular harangues and unmeaning declamation. Oratory was then studied as a refined art; and all the subtleties of it were taught by rule, with as great care as the gladiators were afterwards trained up in Rome. But while they were thus idly trying who should be the lord of their own people, the nerves of government were relaxed, and they became an easy prey to every invading power. In this situation they became the *subjects*, under the title of the *allies*, of Rome, and introduced among them the same taste for haranguing which prevailed among themselves. Well acquainted as they were with the powers of their own language, they set themselves with unwearied assiduity to polish and improve that of their new masters: but with all their assiduity and pains they never were able to make it arrive at that perfection which their own language had acquired; and in the Augustan age, when it had arrived at the summit of its glory, Cicero bitterly complains of its want of copiousness in many particulars.

But as it was the desire of all who studied this language with care, to make it capable of that stately dignity and pomp necessary for public harangues; they followed the genius of the language in this particular, and in a great measure neglected those lesser delicacies which form the pleasure of domestic enjoyment; so that, while it acquired more copiousness, more harmony, and precision, it remained stiff and inflexible for conversation; nor could the minute distinction of nice grammatical rules be ever brought down to the apprehension of the vulgar; so that the language spoken among the lower class of people remained rude and unpolished even till the end of the monarchy. The Huns who over run Italy, incapable of acquiring any knowledge of such a difficult and abstruse language, never adopted it; and the native inhabitants being made acquainted with a language more natural and easily acquired, quickly adopted that idiom of speech introduced by their conquerors, although they still retained many of those words which the confined nature of the barbarian language made necessary to allow them, to express their ideas.—And thus it was that the language of Rome, that proud mistress of the world, from an original defect in its formation, although it had been carried to a perfection in other respects far superior to any northern language at that time, easily gave way to them, and in a few ages the knowledge of it was lost among mankind: while, on the contrary, the more easy nature of the Greek language has still been able to keep some slight footing in the world, although the nations in which it has been spoken have been subjected to the yoke of foreign dominion for upwards of two thousand years, and their country has been twice ravaged by barbarous nations, and more cruelly depressed than ever the Romans were.

From the view which we have already given of the Latin language, it appears evident, that its idiom was more strictly transpositive than any other language yet known, and was attended with all the defects to which that idiom is naturally subjected: nor could it boast of such favourable alleviating circumstances as the Greek, the prevailing sounds of the Latin being far less harmonious to the ear: and although the formation of the words are such as to admit of full and distinct sounds, and so modulated as to lay no restraint upon the voice of the speaker; yet, to a person unacquainted with the language, they do not convey that enchanting harmony so remarkable in the Greek language. The Latin is stately and solemn, it does not excite disgust; but at the same time it does not charm the ear, so as to make it listen with pleased attention. To one acquainted with the language indeed, the nervous boldness of the thoughts, the harmonious rounding of the periods, the full solemn swelling of the sounds, so distinguishable in the most eminent writers in that language which have been preserved to us, all conspire to make it pleasing and agreeable.—In these admired works we meet with all its beauties, without perceiving any of its defects; and we naturally admire, as perfect, a language which is capable of producing such excellent works.—Yet with all these seeming excellencies, this language is less copious, and more limited in its style of composition, than many modern languages far less capable of precision and accuracy than almost any of these, and infinitely behind them all in point of easiness in conversation. But these points have been so fully proved already, as to require no further illustration.—Of the compositions in that language which have been preserved to us, the *orations* of Cicero are best adapted to the genius of the language, and we there see it in its utmost perfection. In the *philosophical works* of that great author we perceive some of its defects; and it requires all the powers of that great man, to render his *epistles* agreeable, as these have the genius of the language to struggle with.—Next to oratory, history agrees with the genius of this language; and Cæsar, in his Commentaries, has exhibited the language in its purest elegance, without the aid of pomp or foreign ornament. ——Among the Poets, Virgil has best adapted his works to his language. The flowing harmony and pomp of it is well adapted for the epic strain, and the correct delicacy of his taste rendered him perfectly equal to the task. But Horace is the only poet whose force of genius was able to overcome the bars which the language threw in his way, and succeed in lyric poetry. Were it not for the brilliancy of the thoughts, and acuteness of remarks, which so eminently distinguish this author's compositions, his odes would long ere now have sunk into utter oblivion.—But so conscious have all the Roman poets been of the unfitness of their language for easy dialogue; that almost none of them, after Plautus and Terence, have attempted any dramatic compositions in that language.—Nor have we any reason to regret that they neglected this branch of poetry, as it is probable, if they had ever become fond of these, they would have been obliged to have adopted so many unnatural contrivances to render them agreeable, as would have prevented us (who of course would have considered ourselves as bound to follow them) from making that progress in the drama which so particularly distinguishes the productions of modern times.

The modern *Italian* language, from an inattention quite common in literary subjects, has been usually called a child

child of the Latin language, and is commonly believed to be the ancient Latin a little debased by the mixture of the barbarous language of those people who conquered Italy. The truth is, it is directly the reverse: for this language, in its general idiom, and fundamental principles, is evidently of the analogous kind, first introduced by these fierce invaders, although it has borrowed many of its words, and some of its modes of phraseology, from the Latin, with which they were so intimately blended that this could scarcely be avoided; and it has been from remarking this slight connection so obvious at first sight, that superficial observers have been led to draw this general conclusion, so contrary to fact.

When Italy was over-run with the Lombards, and the empire destroyed by these northern invaders, they, as conquerors, continued to speak their own native language. Fierce and illiterate, they would not stoop to the servility of studying a language so clogged with rules, and difficult of attainment, as the Latin behoved to be to a people altogether unacquainted with nice grammatical distinctions: while the Romans of necessity were obliged to study the language of their conquerors, as well to obtain some relief of their grievances by prayers and supplications, as to destroy that odious distinction which subsisted between the conquerors and conquered while they continued as distinct people. As the language of their new masters, although rude and confined, was natural in its order, and easy to be acquired, the Latins would soon attain a competent skill in it: and as they bore such a proportion to the whole number of people, the whole language behoved to partake somewhat of the general sound of the former: for, in spite of all their efforts to the contrary, the organs of speech could not at once be made to acquire a perfect power of uttering any unaccustomed sounds; and as the language of the barbarians behoved to be much less copious than the Latin, whenever they found themselves at a loss for a word, they would naturally adopt those which most readily presented themselves from their new subjects. Thus a language in time was formed, somewhat resembling the Latin, both in the general tenor of the sounds, and in the meaning of many words: and as the barbarians gave themselves little trouble about language, and in some cases perhaps hardly knew the general analogy of their own language, it is not surprising if their new subjects should find themselves sometimes at a loss on that account, or if, in these situations, they followed, on some occasions, the analogy suggested to them by their own: which accounts for the strange degree of mixture of heterogeneous grammatical analogy we meet with in the Italian as well as Spanish and French languages.—The Idiom of all the Gothic languages is purely analogous; and in all probability, before their mixture with the Latins and other people in their provinces, the several grammatical parts of speech followed the plain simple idea which that supposes; the verbs and nouns were all probably varied by auxiliaries, and their adjectives retained their simple unalterable state:—but by their mixture with the Latins, this simple form has been in many cases altered; their verbs became in some cases inflected; but their nouns in all these languages still retained their original form; although they have varied their adjectives, and foolishly clogged their nouns with gender, according to the Latin idioms. From this heterogeneous, and fortuitous (as we may say, because injudicious) mixture of parts, results a language possessing almost all the defects of each of the languages of which it is composed; with few of the excellencies of either: for it has neither the ease and precision of the *analogous*, nor the pomp and boldness of the *transpositive* languages; at the same time that it is clogged with almost as many rules, and liable to as great abuses.

These observations are equally applicable to the French and Spanish, as to the Italian language.—With regard to this last in particular, we may observe, that as the natural inhabitants of Italy, before the last invasion of the barbarians, were sunk and enervated by luxury and that depression of mind and genius which anarchy always produces; they had become fond of feasting and entertainments, and the enjoyment of sensual pleasures constituted their highest delight; and their language partook of the same debility as their body.——The barbarians too—unaccustomed to the seductions of pleasure—soon fell from their original boldness and intrepidity,—and, like Hannibal's troops of old, were enervated by the sensual gratifications into which a nation of conquerors unaccustomed to the restraint of government freely indulged.—The softness of the air—the fertility of the climate—the unaccustomed flow of riches which they at once acquired,—together with the voluptuous manner of their conquered subjects,—all conspired to enervate their minds, and render them soft and effeminate.—No wonder then, if a language new-moulded should at this juncture partake of the genius of the people who formed it; and instead of participating of the martial boldness and ferocity of either of their ancestors, should be softened and enfeebled by every device which an effeminate people could invent.——The strong consonants which terminated the words, and gave them life and boldness, being thought too harsh for the delicate ears of these sons of sloth, were banished their language;—while sonorous vowels, which could be protracted to any length in music, were substituted in their stead.——Thus the Italian language is formed flowing and harmonious, but destitute of those nerves which constitute the strength and vigour of a language: at the same time, the sounds are neither enough diversified, nor in themselves of such an agreeable tone, as to afford great pleasure without the aid of musical notes;—and the small pleasure which this affords is still lessened by the little variety of measure which the great similarity of the termination of words occasions.—Hence it happens, that this language is fitted for excelling in fewer branches of literature than almost any other:—and although we have excellent historians, and more than ordinary poets, in this language; yet they labour under great inconveniences from the language in which they write,—as it wants nerves and stateliness for the former,—and sufficient variety of modulation for the latter.—It is, more particularly on this account, altogether unfit for an epic poem:—and although attempts have been made in this way by two men, whose genius, if not fettered by the language, might have been crowned with success; yet these, notwithstanding the fame that

with

with ſome they may have acquired, muſt, in point of poetic harmony, be deemed defective by every impartial perſon. Nor is it poſſible that a language which hardly admits of poetry without rhime, can ever be capable of producing a perfect poem of great length; and the ſtanza to which their poets have ever confined themſelves, muſt always produce the moſt diſagreeable effect in a poem where unreſtrained pomp or pathos are neceſſary qualifications. The only ſpecies of poetry in which the Italian language can claim a ſuperior excellence, is the tender tone of elegy: and here it remains unrivalled and alone:—the plaintive melody of the ſounds, and ſmooth flow of the language, ſeem perfectly adapted to expreſs that ſoothing melancholy which this ſpecies of poetry requires.—On this account, the plaintive ſtanzas of the *Paſtor Fido* of *Guarini* have juſtly gained to that poem an univerſal applauſe; although, unleſs on this account alone, it is perhaps inferior to almoſt every other poem of the kind which ever appeared.——We muſt obſerve with ſurpriſe, that the Italians, who have fettered every other ſpecies of poetry with the ſevereſt ſhackles of rhime, have in this ſpecies ſhewed an example of the moſt unreſtrained freedom; the happy effects of which ought to have taught all Europe the powerful charms attending it: yet with amazement we perceive, that ſcarce an attempt to imitate them has been made by any poet in Europe except by Milton in his Lycidas; no dramatic poet, even in Britain, having ever adopted the unreſtrained harmony of numbers to be met with in this and many other of their beſt dramatic compoſitions

Of all the languages which ſprung up from the mixture of the Latins with the northern people on the deſtruction of the Roman empire, none of them approach ſo near to the genius of the Latin as the Spaniſh does. For as the Spaniards have been always remarkable for their military prowefs and dignity of mind, their language is naturally adapted to expreſs ideas of that kind. Sonorous and ſolemn, it admits nearly of as much dignity as the Latin. For converſation, it is the moſt elegant and courteous language in Europe.—The humane and generous order of chivalry was firſt invented and kept its footing longeſt in this nation; and although it run at laſt into ſuch a ridiculous exceſs as deſervedly made it fall into univerſal diſrepute, yet it left ſuch a ſtrong tincture of romantic heroiſm upon the minds of all ranks of people, as made them jealous of their glory, and ſtrongly emulous of cultivating that heroic politeneſs, which they conſidered as the higheſt perfection they could attain. Every man diſdained to flatter, or to yield up any point of honour which he poſſeſſed: at the ſame time, he rigorouſly exacted from others all that was his due. Theſe circumſtances have given riſe to a great many terms of reſpect, and courteous condeſcenſion, without meanneſs or flattery, which give their dialogue a reſpectful politeneſs and elegance unknown to any other European language. This is the reaſon why the characters ſo finely drawn by Cervantes in Don Quixote are ſtill unknown to all but thoſe who underſtand the language in which he wrote.—Nothing can be more unlike the gentle meekneſs and humane heroiſm of the knight, or the native ſimplicity, warmth of affection, and reſpectful loquacity of the ſquire,—than the inconſiſtent follies of the one, or the impertinent forwardneſs and diſreſpectful petulance of the other, as they are exhibited in every Engliſh tranſlation.—Nor is it poſſible to repreſent ſo much familiarity, united with ſuch becoming condeſcenſion in the one, and unfeigned deference in the other, in any other European language, as is neceſſary to paint theſe two admirable characters.

Although this language, from the ſolemn dignity and majeſtic elegance of its ſtructure, is perhaps better qualified than any other modern one for the ſublime ſtrains of epic poetry; yet as the poets of this nation have all along imitated the Italians by a moſt ſervile ſubjection to rhime, they never have produced one poem of this ſort, which in point of poeſy of ſtyle deſerves to be tranſmitted to poſterity. And in any other ſpecies of poetry but this, or the higher tragedy, is it not naturally fitted to excel. But although the drama and other polite branches of literature were early cultivated in this country, and made conſiderable progreſs in it, before the thirſt of gain debaſed their ſouls, or the deſire of univerſal dominion made them forfeit that liberty which they once ſo much prized; ſince they became enervated by an overbearing pride, and their minds enſlaved by ſuperſtition; all the polite arts have been neglected: ſo that, while other European nation have been advancing in knowledge, and improving their language, they have remained in a ſtate of torpid inactivity; and their language has not arrived at that perfection which its nature would admit, or the acute genius of the people would have made us naturally expect.

It will perhaps, by ſome, be thought an unpardonable inſult, if we do not allow the French the preference of all modern languages in many reſpects. But ſo far muſt we pay a deference to truth, as to be obliged to rank it among the pooreſt languages in Europe.—Every other language has ſome ſounds which can be uttered clearly by the voice: even the Italian, although it wants energy, ſtill poſſeſſes diſtinctneſs of articulation. But the French is almoſt incapable of either of theſe beauties; for in that language the vowels are ſo much curtailed in the pronunciation, and the words run into one another in ſuch a manner, as of neceſſity to produce an indiſtinctneſs which renders it incapable of meaſure or harmony. From this cauſe, it is in a great meaſure incapable of poetic modulation, and rhime has been obliged to be ſubſtituted in its ſtead; ſo that this pooreſt of all contrivances which has ever yet been invented to diſtinguiſh poetry from proſe, admitted into all the modern languages when ignorance prevailed over Europe, has ſtill kept ſome footing in the greateſt part of theſe, rather through a deference for eſtabliſhed cuſtoms, than from any neceſſity.—Yet as the French language admits of ſo little poetic modulation, rhime is in ſome meaſure *neceſſary* to it; and therefore they have adopted, and dignified this poor deviation from proſe with the name of Poetry; and, by their blind attachment to this art, have neglected to improve ſo much as they might have done the ſmall powers for harmony that their language is poſſeſſed of; and, by being long accuſtomed to this falſe taſte, have become fond of it to ſuch a ridiculous exceſs, as to have all their tragedies,—nay even their comedies, in rhime. While the poet is obliged to enervate his language, and check the flow of compoſition, for the

the ſake of linking his lines together, the judicious actor finds more difficulty in deſtroying the appearance of that meaſure, and preventing the clinking of the rhimes, than in all the reſt of his taſk.——After this we will not be ſurpriſed to find Voltaire attempt an epic poem in this ſpecies of poetry; although the more judicious Fenelon in his *Telemaque* had ſhewn to his countrymen the only ſpecies of poeſy which their language could admit of for any poem which aſpired to the dignity of the epic ſtrain.——Madam Deſpouliers, in her *Idyllie*, has ſhewn the utmoſt extent of harmony to which their language can attain in ſmaller poems:—indeed in the tenderneſs of an elegy, or the gaiety of a ſong, it may ſucceed; but it is ſo deſtitute of force and energy, that it can never be able to reach the Pindaric, or even perhaps the Lyric ſtrain,—as the ineffectual efforts even of the harmonious Rouſſeau, in his tranſlation of the Pſalms of David of this ſtamp, may fully convince us.

With regard to its power in other ſpecies of compoſition, the ſententious rapidity of Voltaire, and the more nervous dignity of Rouſſeau, afford us no ſmall preſumption, that, in a ſkilful hand, it might acquire ſo much force, as to tranſmit to futurity hiſtorical facts in a ſtyle not altogether unworthy of the ſubject—In attempts at pathetic declamation, the ſuperior abilities of the compoſer may perhaps on ſome occaſions excite a great idea, but this is ever cramped by the genius of the language: and altho' no nation in Europe can boaſt of ſo many orations where this grandeur is attempted; yet perhaps there are few who cannot produce more perfect, although not more laboured, compoſitions of this kind.

But notwithſtanding the French language labours under all theſe inconveniences;—although it can neither equal the dignity or genuine politeneſs of the Spaniſh, the nervous boldneſs of the Engliſh, nor the melting ſoftneſs of the Italian;—although it is deſtitute of poetic harmony, and ſo much cramped in ſound as to be abſolutely unfit for almoſt every ſpecies of muſical compoſition*;—yet the ſprightly genius of that volatile people has been able to ſurmount all theſe difficulties, and render it the language moſt generally eſteemed, and moſt univerſally ſpoken, of any in Europe: for this people, naturally gay and loquacious, and fond to exceſs of thoſe ſuperficial accompliſhments which engage the attention of the fair ſex, have invented ſuch an infinity of words capable of expreſſing vague and unmeaning compliment, now dignified by the name of *politeneſs*, that, in this ſtrain, one who uſes the French can never be at a loſs; and as it is eaſy to converſe *more*, and really ſay *leſs*, in this than any other language, a man of very moderate talents may diſtinguiſh himſelf much more by uſing this than any other that has ever yet been invented.—On this account, it is peculiarly well adapted for that ſpecies of converſation which muſt ever take place in thoſe general and promiſcuous companies, where many perſons of both ſexes are met together for the purpoſes of relaxation or amuſement; and muſt of courſe be naturally admitted into the courts of princes, and aſſemblies of great perſonages; who, having fewer equals with whom they can aſſociate, are more under a neceſſity of converſing with ſtrangers, in whoſe company the tender ſtimulus of friendſhip does not ſo naturally expand the heart to mutual truſt or unreſtrained confidence. In theſe circumſtances, as the heart remaineth diſengaged, converſation muſt neceſſarily flag; and mankind in this ſituation will gladly adopt that language in which they can converſe moſt eaſily without being deeply intereſted—One theſe accounts the French now is, and probably will continue to be reckoned the moſt polite language in Europe, and therefore the moſt generally ſtudied and known: nor ſhould we envy them this diſtinction, if our countrymen would not weaken and enervate their own manly language, by adopting too many of their unmeaning phraſes.

The Engliſh is perhaps poſſeſſed of a greater degree of excellence, blended with a greater number of defects, than any of the languages that we have hitherto mentioned.—As the people of great Britain are a bold, daring, and impetuous race of men; ſubject to ſtrong paſſions, and, from the abſolute freedom and independence which reigns among all ranks of people throughout this happy iſle, little ſolicituous about controuling theſe paſſions;—our language takes its ſtrongeſt characteriſtic diſtinction from the genius of the people; and, being bold, daring, and abrupt, is admirably well adapted to expreſs thoſe great emotions which ſpring up in an intrepid mind at the proſpect of intereſting events. Peculiarly happy too in the full and open ſound of the vowels, which forms the characteriſtic *tone* of the language, and in the ſtrong uſe of the aſpirate H in almoſt all thoſe words which are uſed as exclamations, or marks of ſtrong emotions upon intereſting occaſions, that particular claſs of words called *interjections* have, in our language, more of that fulneſs and unreſtrained freedom of tones, in which their chief power conſiſts, and are puſhed forth from the inmoſt receſſes of the ſoul in a more forcible and unreſtrained manner, than any other language whatever. Hence it is more

* An author of great diſcernment, and well acquainted with the French language, has lately made the ſame remark; and as the loftineſs of his genius often prevents him from bringing down his illuſtrations to the level of ordinary comprehenſion, he has on this, and many other occaſions, been unjuſtly accuſed of being fond of paradoxes.---But as muſic never produces its full effect but when the tones it aſſumes are in uniſon with the idea that the words naturally excite, it of neceſſity follows, that if the words of any language do not admit of that fulneſs of ſound, or of that ſpecies of tones, which the paſſion or affection that may be deſcribed by the words would naturally require to excite the ſame idea in the mind of one who was unacquainted with the language, it will be impoſſible for the muſic to produce its full effect, as it will be cramped and confined by the ſound of the words;---and as the French language does not admit of thoſe full and open ſounds which are neceſſary for pathetic expreſſion in muſic, it muſt of courſe be unfit for muſical compoſition.---It is true indeed, that in modern times, in which ſo little attention is beſtowed on the ſimple and ſublime charms of pathetic expreſſion, and a fantaſtical tingling of unmeaning ſounds is called muſic---where the ſenſe of the words are loſt in fugues, quavers, and unneceſſary repetition of particular ſyllables,---all languages are nearly equally fitted for it; and among theſe the French: nor is it to be doubted, that, in the eaſy gaiety of a ſong, this language can properly enough admit of all the muſical expreſſion which that ſpecies of compoſition may require.

more peculiarly adapted for the great and intereſting ſcenes of the *Drama* than any language that has yet appeared in the globe.—Nor has any other nation ever arrived at that perfection which the Engliſh may juſtly claim in that reſpect; for however faulty our dramatic compoſitions may be in ſome of the critical niceties which relate to this art,—in nervous force of diction, and in the natural expreſſion of thoſe great emotions which conſtitute its ſoul and energy, we claim, without diſpute, an unrivalled ſuperiority.—Our language too, from the great intercourſe that we have had with almoſt all the nations of the globe by means of our extenſive commerce, and from the eminent degree of perfection which we have attained in all the arts and ſciences, has acquired a copiouſneſs beyond what any other modern nation can lay claim to; and even the moſt partial favourers of the Greek language are forced to acknowledge, that in this reſpect it muſt give place to the Engliſh. Nor is it leſs happy in that facility of conſtruction which renders it more peculiarly adapted to the genius of a free people, than any other form of language.—Of an *idiom* purely analogous, is has deviated leſs from the genius of that *idiom*, and poſſeſſes more of the characteriſtic advantages attending it, than any other language that now exiſts: for, while *others*, perhaps by their more intimate connection with the Romans, have adopted ſome of their tranſpoſitions, and clogged their language with unneceſſary fetters, *we* have preſerved ourſelves free from the contagion, and ſtill retain the primitive ſimplicity of our language. Our *verbs* are all varied by auxiliaries (except in the inſtance we have already given, which is ſo much in our favours); our *nouns* remain free from the perplexing embarraſſment of *genders*, and our pronouns mark this diſtinction where neceſſary with the moſt perfect accuracy; our *articles* alſo are of courſe freed from this unnatural encumbrance, and our *adjectives* preſerve their natural freedom and independence. From theſe cauſes, our language follows an order of conſtruction ſo natural and eaſy, and the rules of *ſyntax* are ſo few and obvious, as to be within the reach of the moſt ordinary capacity. So that from this, and the great clearneſs and diſtinctneſs of meaning which this mode of conſtruction neceſſarily is accompanied with, it is much better adapted for the familiar intercourſe of private ſociety, and liable to fewer errors in uſing it, than any other language yet known; and on this account we may boaſt, that in no nation of Europe do the lower claſs of people ſpeak their language with ſo much accuracy, or have their minds ſo much enlightened by knowledge, as thoſe of great Britain.——What then ſhall we ſay of the diſcernment of thoſe grammarians, who are every day echoing back to one another complaints of the poverty of our language on account of the few and ſimple rules which it requires in ſyntax? As juſtly might we complain of an invention in mechanics, which, by means of one or two ſimple movements, obvious to an ordinary capacity, little liable to accidents, and eaſily put in order by the rudeſt hand, ſhould poſſeſs the whole powers of a complex machine, which had required an infinite apparatus of wheels and contrary movements, the knowledge of which could only be acquired, or the various accidents to which it was expoſed by uſing it be repaired, by the powers of an ingenious artiſt, as complain of this characteriſtic excellence of our language as a defect.

But if we thus enjoy in an eminent degree the advantages attending an *analogous* language; we likewiſe feel in a conſiderable meaſure the defects to which it is expoſed; as the number of monoſyllables with which it always muſt be embarraſſed, notwithſtanding the great improvements which have been made in our language ſince the revival of letters in Europe, prevents in ſome degree that ſwelling fulneſs of ſound which ſo powerfully contributes to harmonious dignity and graceful cadences in literary compoſitions.—And as the genius of the people of Britain has always been more diſpoſed to the rougher arts of command, than the ſofter inſinuations of perſuaſion, no pains have been taken to correct theſe natural defects of our language; but on the contrary, by an inattention of which we have hardly a parallel in the hiſtory of any civilized nation, we meet with many inſtances, even within this laſt century, of the harmony of ſound being ſacrificed to that brevity ſo deſireable in converſation, as many elegant words have been curtailed, and harmonious ſyllables ſuppreſſed, to ſubſtitute in their ſtead others, ſhorter indeed, but more barbarous and uncouth.—Nay, ſo little attention have our forefathers beſtowed upon the harmony of ſounds in our language, that one would be tempted to think, on looking back to its primitive ſtate, that they had on ſome occaſions ſtudiouſly debaſed it.—Our language, at its firſt formation, ſeems to have laboured under a capital defect in point of ſound, as ſuch a number of S's enter into the formation of our words, and ſuch a number of letters and combinations of other letters aſſume a ſimilar ſound, as to give a general hiſs through the whole tenor of our language, which muſt be exceedingly diſagreeable to every unprejudiced ear. We would therefore have naturally expected, that at the revival of letters, when our forefathers became acquainted with the harmonious languages of Greece and Rome, they would have acquired a more correct taſte, and endeavoured, if poſſible, to have diminiſhed the prevalence of this diſguſting ſound. But ſo far have they been from thinking of this, that they have multiplied this letter exceedingly. The plurals of almoſt all our nouns were originally formed by adding the harmonious ſyllable *en* to the ſingular, which has given place to the letter *s*; and inſtead of *houſen* formerly, we now ſay *houſes*. In like manner, many of the variations of our verbs were formed by the ſyllable *eth*, which we have likewiſe changed into the ſame diſagreeable letter; ſo that, inſtead of *loveth*, *moveth*, *writeth*, *walketh*, &c. we have changed them into the more modiſh form of *loves*, *moves*, *writes*, *walks*, &c.—Our very auxiliary verbs have ſuffered the ſame change; and inſtead of *hath* and *doth*, we now make uſe of *has* and *does*. From theſe cauſes, notwithſtanding the great improvements which have been made in language, within theſe few centuries, in other reſpects; yet, with regard to the pleaſingneſs of ſound alone, it was perhaps much more perfect in the days of Chaucer than at preſent: and although cuſtom may have rendered theſe ſounds ſo familiar to our ear, as not to affect us much; yet to an unprejudiced perſon, unacquainted with our language, we have

have not the smallest doubt, but the language of *Bacon* or *Sydney* would appear more harmonious than that of *Robertson* or *Hume*.—This is indeed the fundamental defect of our language, and loudly calls for reformation.

But notwithstanding this great and radical defect in our language with regard to pleasingness of sounds, which must be so strongly perceived by every one who is unacquainted with the meaning of our words; yet to those who understand the language, the exceeding copiousness which it allows in the choice of words proper for the occasion, and the nervous force which it derives from the accent, with the perspicuity and graceful elegance the emphasis bestows upon it, makes this defect be totally overlooked; and we could produce such numerous works of prose which excel in almost every different style of composition as would be tiresome to enumerate; and every reader of taste and discernement will be able to recollect a sufficient number of writings which excel in point of style, between the graceful and becoming gravity so conspicuous in all the works of the author of the *Whole Duty of Man*, and the animated and nervous diction of Robertson in his history of Charles the fifth,—the more flowery style of Shaftsbury, or the Attic simplicity and elegance of Addison. But although we can equal, if not surpass, every modern language in works of prose, it is in its poetical powers that our language shines forth with the greatest lustre.—The brevity to which we must here necessarily confine ourselves, prevents us from entering into a minute examination of the poetical powers of our own, compared with other languages; otherwise it would be easy to shew, that every other modern language labours under great restraints in this respect which ours is freed from;—that our language admits of a greater variety of poetic movements, and diversity of cadence, than any of the admired languages of antiquity;—that it distinguishes with the greatest accuracy between accent and quantity, and is possessed of every other poetic excellence which their languages were capable of: so that we are possessed of all the sources of harmony which they could boast; and, besides all these, have one superadded, which is the cause of greater variety and more forcible expression in numbers than all the rest; that is, the unlimited power given to the emphasis over quantity and cadence; by means whereof, a necessary union between sound and sense, numbers and meaning, in versification, unknown to the ancients, has been brought about, which gives our language in this respect a superiority over all those justly admired languages.—But as we cannot here further pursue this subject, we shall only observe, that these great and distinguishing excellencies far more than counterbalance the inconveniencies that we have already mentioned; and although, in mere pleasantness of sounds, or harmonious flow of syllables, our language may be inferior to the Greek, the Latin, Italian, and Spanish; yet in point of manly dignity, graceful variety, intuitive distinctness, nervous energy of expression, unconstrained freedom and harmony of poetic numbers, it will yield the palm to none.—Our immortal Milton, slowly rising, in graceful majesty stands up as equal, if not superior in these respects to any poet, in any other language, that ever yet existed;—while Thomson, with more humble aim, in melody more smooth and flowing, softens the soul to harmony and peace:—the plaintive moan of Hammond calls forth the tender tear and sympathetic sigh; while Gray's more soothing melancholy fixes the sober mind to silent contemplation:—more tender still than these, the amiable Shenston comes; and from his Doric reed, still free from courtly affectation, flows a strain so pure, so simple, and of such tender harmony, as even Arcadian shepherds would be proud to own. But far before the rest, the daring Shakespear steps forth conspicuous, clothed in native dignity; and, pressing forward with unremitting ardour, boldly lays claim to both dramatic crowns, held out to him by Thalia and Melpomene:—his rivals, far behind, look up, and envy him for these unfading glories; and the astonished nations round, with distant awe, behold and tremble at his daring flight.——Thus the language, equally obedient to all, bends with ease under their hands, whatever form they would have it assume; and, like the yielding wax, readily receives, and faithfully transmits to posterity, those impressions which they have stamped upon it.

Such are the principal outlines of the language of Great Britain, such are its beauties, and such its most capital defects; a language more peculiarly circumstanced than any that has ever yet appeared.——It is the language of a great and powerful nation, whose fleets surround the globe, and whose merchants are in every port; a people admired, or revered by all the world;—and yet it is less known in every foreign country, than any other language in Europe.—In it are written more perfect treatises on every art and science, than are to be found in any other language;—yet it is less sought after or esteemed by the literati in any part of the globe, than almost any of these. Its superior powers for every purpose of language are sufficiently obvious from the models of perfection, in almost every particular, which can be produced in it;—yet it is neglected, despised, and vilified by the people who use it; and many of those authors who owe almost the whole of their fame to the excellence of the language in which they wrote, look upon that very language with the highest contempt.—Neglected and despised, it has been trodden under foot as a thing altogether unworthy of cultivation or attention. Yet in spite of all these inconveniences, in spite of the many wounds it has thus received, it still holds up its head, and preserves evident marks of that comeliness and vigour which are its characteristical distinction. Like a healthy oak planted in a rich and fertile soil, it has sprung up with vigour: and although neglected, and suffered to be over-run with weeds; although exposed to every blast, and unprotected from every violence; it still beareth up under all these inconveniences, and shoots up with a robust healthiness and wild luxuriance of growth. Should this plant, so sound and vigorous, be now cleared from those weeds with which it has been so much encumbered;—should every obstacle which now buries it under thick shades, and hides it from the view of every passenger, be cleared away;—should the soil be cultivated with care, and a strong fence be placed around it, to prevent the idle or the wicked from breaking, or distorting its branches;—who can tell with what additional vigour it would flourish, or what amazing magnitude and perfection

tion it might at laſt attain!—How would the aſtoniſhed world behold, with reverential awe, the majeſtic gracefulneſs of that object which they ſo lately deſpiſed!

[N. B. *Some unavoidable circumſtances which attended the printing of the preceding article, have occaſioned ſeveral miſtakes in it, of which the following deſerve immediate notice.*]

LANGUED, in heraldry, expreſſes ſuch animals whoſe tongue apppearing out of the mouth, is borne of a different colour from that of the body.

LANGUEDOC, a province of France, bounded by Lionois, on the north; by the river Rhone, which divides it from Dauphine and Provence, on the eaſt; by the Mediterranean and the the Pyrenees, on the ſouth; and by Guienne and Gaſcony, on the weſt.

LANGUOR, among phyſicians, ſignifies great weakneſs and loſs of ſtrength, attended with a dejection of mind; ſo that the patients can ſcarce walk, or even ſtand upright, but are apt to faint away.

LANIGEROUS, an appellation given to whatever bears wool.

LANIUS, the BUTCHER-BIRD, in ornithology, a genus belonging to the order of accipitres; the characters of which are theſe: The beak is ſomewhat ſtrait, with a tooth on each ſide towards the apex, and naked at the baſe; and the tongue is lacerated. There are twenty-ſix ſpecies, diſtinguiſhed by the ſhape of the tail, and colour.

LANNIERS, or LANNIARDS, in a ſhip, are ſmall ropes reeved into the dead-man's-eyes of all ſhrowds, either to ſlacken them or ſet them taught: the ſtays of all maſts are alſo ſet taught by lanniers.

LANTANA, in botany, a genus of the didynamia angioſpermia claſs. The calix conſiſts of four obſolete teeth; and the drupa has two cells. There are ſeven ſpecies, none of them natives of Britain.

LANUGO, the ſoft down of plants, like that growing on the fruit of the peach tree.

LANZO, a town of Italy, in the territory of Piedmont, ſituated fifteen miles north of Turin.

LAODICEA, an ancient city of the leſſer Aſia, ſituated eaſt of Epheſus, now in ruins.

LAON, a city of France, in the province of the Iſle of France, ſituated in E. long. 3° 45′, lat. 49′ 37.

LAOS, a country of the farther India in Aſia, bounded by China on the north; by Tonquin, on the eaſt; by Siam and Cambodia, on the ſouth; and Ava and Pegu, on the weſt.

LAPATHUM, in botany. See RUMEX.

LAPIDARY, an artificer, who cuts precious ſtones.

The art of cutting precious ſtones is of great antiquity. The French, though they fell into it but lately, have notwithſtanding carried this art to a very great perfection, but not in any degree ſuperior to the Engliſh.

There are various machines employed in the cutting of precious ſtones, according to their quality: the diamond, which is extremely hard, is cut on a wheel of ſoft ſteel, turned by a mill, with diamond-duſt, tempered with olive-oil, which alſo ſerves to poliſh it.

The deſcription of the diamond-cutter's wheel or mill, as repreſented in Plate CIII. fig. 7. is as follows: *a* is the pincers; *b*, the ſcrew of the pincers; *c*, the ſhell that carries the maſtic and the diamond; *d*, the maſtic that ſoftens the diamond at the end of the ſhell; *e*, the diamond preſented to the wheel, to be cut facetwiſe; *f*, the iron-wheel turning on its pivot; *g*, iron-pegs, to fix and keep the pincers ſteady; *h*, ſmall pigs of lead of different weights, wherewith the pincers are loaded at pleaſure to keep them ſteady; *i*, a wooden wheel; *k*, the axis of the wheel. It is bended and makes an elbow under the wheel, to receive the impulſion of a bar that does the office of a turning handle; *l*, the ſole, or ſquare piece of ſteel, wherein the pivot of the tree or axis moves; *m*, the turning handle, that ſets the wheel a-going by means of the elbow of its axis; the elbow of the piercer wherewith a hogſhead is broached, will give an idea of this kind of motion; *n*, the cat-gut ſtring, that goes round both the iron and the wooden wheels. If the wooden wheel is twenty times larger than the iron-one, the latter ſhall make twenty turns upon the diamond, whilſt the large wheel makes but one round its axis; and whilſt the boy gives, without any reſiſtance, a hundred impulſions to the turning handle, the diamond experiences a thouſand times the friction of the whole grinding wheel.

The diamond-cutter follows the work with his eyes, without taking any other ſhare in it than that of changing the place of the diamond to bite on a new ſurface; and of timely thrown upon it, with a few drops of oil, the minute particles of the diamonds firſt ground one againſt the other, to begin the cutting of them.

The oriental ruby, ſapphire, and topaz, are cut on a copper wheel with diamond duſt, tempered with olive-oil, and are poliſhed on another copper-wheel with tripoli and water. The hyacinth, emerald, amethyſt, garnets, agats, and other ſtones, not of an equal degree of hardneſs with the other, are cut on a leaden wheel with ſmalt and water, and poliſhed on a tin-wheel with tripoli. The turquois of the old and new rock, giraſol and opal, are cut and poliſhed on a wooden wheel with tripoli alſo.

The lapidaries of Paris have been a corporation ſince the year 1290. It is governed by four jurats, who ſuperintend their rights and privileges, viſit the maſter-workmen, take care of the maſter-piece of workmanſhip, bind apprentices, and adminiſter the freedom.

LAPIS, in general, is uſed to denote a ſtone of any kind.

LAPLAND, the moſt northerly part of Europe, divided

ded into Norwegian Lapland, Swedish Lapland, and Russian Lapland: it lies between 10° and 35° of E. long. and between 65 and 72° of N. lat.

LAPWING, in ornithology. See FRINGA.

LAQUEUS, in surgery, a kind of ligature, so contrived, that when stretched by any weight, or the like, it draws up close. Its use is to extend broken or disjointed bones, to keep them in their places when they are set, and to bind the parts close together.

LAR-BOARD, among seamen, the left-hand side of the ship, when you stand with your face towards the head.

LARCENY, in law, a felonius carrying away another person's goods; and this, according to the value of the thing stolen, is either grand, or petit larceny; the first being stealing effects above the value of 1 s. and the last such as are either of that value, or under it.

LAREDO, a port-town of Spain, in the province of Biscay, situated on the coast of Biscay: W. lon. 3° 40′, N. lat. 43° 30′.

LARES, certain inferior deities among the ancient Romans, who were the guardians of houses; they were also sometimes taken for the guardians of streets and ways, and Tibullus makes them the guardians of the fields. According to Ovid, they were the sons of Mercury and Lara, whose tongue was cut out by Jupiter, because she revealed his adulteries to Juno; and not contented with this, he delivered her to Mercury, with orders to conduct her to hell; but he falling in love with her by the way, had twins by her, who from their mother were called lares.

These domestic deities were sometimes represented under the figure of a dog, the symbol of fidelity; because dogs have the same function as the lares, which is to guard the house. At other times their images were covered with the skin of a dog, and had the figure of that domestic animal standing by them. The principal sacrifices to the lares, were incense, fruit, and a hog.

LARIX. See PINUS.

LARK, in ornithology. See ALAUDA.

LARUS, the GULL, in ornithology, a genus belonging to the order of anseres, the characters of which are these: The bill is strait, cultrated, a little crooked at the point, and without teeth; the inferior mandible is gibbous below the apex, the nostrils are linear, a little broader before, and situate in the middle of the back. There are 11 species, principally distinguished by their colour.

LARYNX, in anatomy. See ANAT. p. 300.

LASERPITIUM, LASER-WORT, a genus of the pentandria digynia class. The fruit is oblong, with eight membranaceous angles. There are nine species, none of them natives of Britain.

LASSITUDE, or WEARINESS, in medicine, a morbid sensation, that comes on spontaneously, without any previous motion, exercise, or labour. This is a frequent symptom in acute distempers: it arises either from an increase of bulk, a diminution of proper evacuation, or too great a consumption of the fluids necessary to maintain the spring of the solids, or from a vitiated secretion of that juice.

LAST, in general, signifies the burden or load of a ship.

It signifies also a certain measure of fish, corn, wool, leather, *&c.* A last of codfish, white herrings, meal, and ashes for soap, is twelve barrels; of corn or rapeseed, ten quarters; of gun-powder, twenty-four barrels; of red-herrings, twenty cades; of hides, twelve dozen; of leather, twenty dickers; of pich and tar, fourteen barrels; of wool, twelve sacks; of stock-fish, one thousand; of flax or feathers, 1700 lb.

LASTAGE, or LESTAGE, a duty exacted in some fairs and markets, for carrying things bought whither one will. It signifies also the ballast or lading of a ship; and sometimes is used for garbage, rubbish, or such like filth.

LATERAN COUNCILS, those councils held in the basilica of the Latin church at Rome. See COUNCIL,

There have been five councils held in this place. *viz.* in the years 1123, 1139, 1179, 1215, and 1513.

LATH, in building, a long, thin and narrow slip of wood, nailed to the rafters of a roof or ceiling, in order to sustain the covering.

LATHE, in turning, a well-known engine used in turning wood, ivory, and other materials.

LATHRÆA, in botany, a genus of the didynamia angiospermia class. The calix consists of four segments; and the capsule has but one cell. There are four species, only one of which, *viz.* the squamaria, or toothwort, is a native of Britain.

LATHYRUS, in botany, a genus of the diadelphia decandria class. The stylus is plain, villous above, and broader below; and the two superior laciniæ of the calix are shorter than the others. There are 21 species, seven of them natives of Britain; *viz.* the pissolia or crimson grass-vetch; the yellow vetchling; the hirsutus, or rough-codded chickling-vetch; the latifolius, or broad-leaved pease-everlasting; the sylvestris, or narrow-leaved pease-everlasting; the palustris, or marsh chickling-vetch; and the pratensis, or common yellow vetchling.

LATIN, a dead language, first spoken in Latium, and afterwards at Rome; and still used in the Romish church, and among many of the learned. See LANGUAGE.

LATISSIMUS, in anatomy. See ANAT. p. 195.

LATITUDE. See GEOGRAPHY, and ASTRONOMY.

LATITUDINARIAN, a person of moderation with regard to religious opinions, who believes there is a latitude in the road to heaven, which may admit people of different persuasions.

LATTEN, denotes iron-plates tinned over, of which tea-canisters are made.

LAVANDULA, LAVENDER, in botany, a genus of the didynamia-gymnospermia class. The calix is oval, subdentated, and supported by a bractea; and the stamina are within the tube. There are four species, none of them natives of Britain.

LAVATERA, in botany, a genus of the monadelphia polyandria class. The calix is double, the exterior one being divided into three segments; and there are many capsules, containing each a number of seeds. There are nine species, only one of which, *viz.* the arborea,

arborea, or sea tree mallow, is a native of Britain.

LAUBACH, a city of Germany, in the circle of Austria, and the capital of the duchy of Carinthia: E. lon. 14° 40′, and N. lat. 46° 28′.

LAUDANUM. See OPIUM.

LAUDER, a borough town of Scotland, in the shire of Mers, situated twenty-two miles south-east of Edinburgh.

LAVENDER. See LAVENDULA.

LAUGHTER, an affection peculiar to mankind, occasioned by something that tickles the fancy.

In laughter, the eye-brows are raised about the middle, and drawn down next the nose; the eyes are almost shut; the mouth opens, and shews the teeth, the corners of the mouth being drawn back and raised up; the cheeks seem puffed up, and almost hide the eyes; the face is usually red, and nostrils open, and the eyes wet.

LAUNCESTON, the county-town of Cornwal, thirty-six miles west of Exeter; W. lon. 4° 40′, N. lat. 50° 45′.

It sends two members to parliament.

LAUNCH, in the sea language, signifies to put out: as, *launch the ship*, that is, put her out of the dock: *launch aft*, or *forward*, speaking of things that are stowed in the hold, is, put them more forward: *launch, ho!* is a term used when a yard is hoisted high enough, and signifies, *hoist no more*.

LAURA, in church-history, a name given to a collection of little cells, at some distance from each other, in which the hermits, in ancient times, lived together in a wilderness.

These hermits did not live in community, but each monk provided for himself in his distinct cell. The most celebrated lauras mentioned in ecclesiastical history, were in Palestine; as the Laura of St Euthymus, at four or five leagues distance from Jerusalem; the laura of St Saba, near the brook Cedron; the laura of the Towers, near the river Jordan, *&c.*

LAURENTALIA, in Roman antiquity, a festival celebrated in honour of Acca Laurentia, Romulus's nurse.

LAURUS, in botany, a genus of the enneandria monogynia class. It has no calix; the corolla consists of six petals; the nectarium consists of three glands, with two bristles surrounding the germen; and the drupa contains but one seed. There are eleven species, among which are the cinnamonium, or cinnamon-tree; the camphora, or camphor-tree, (see CAMPHOR;) and the sassafras, or sassafras-tree.

The bark of the cinnamon-tree is light, thin, and of a reddish colour, rolled up in long quills or canes; of a fragrant delightful smell, and an aromatic sweet pungent taste, with some degree of astringency. It is generally mixed with the casia bark: this last is easily distinguishable by its breaking over smooth, whilst cinnamon splinters; and by its slimy mucilaginous taste, without any thing of the roughness of the true cinnamon. Cinnamon is a very elegant and useful aromatic, more grateful both to the palate and stomach than most other substances of this class: by its astringent quality it likewise corroborates the viscera, and proves of great service in several kinds of alvine fluxes and immoderate discharges from the uterus. As essential oil, a simple and spirituous distilled water, and a tincture of it, are kept in the shops: it is likewise employed as a spicy ingredient in a great number of compositions.

The root of the sassafras-tree is brought to us in long straight pieces, very light, and of a spongy texture, covered with a rough fungous bark; outwardly of an ash colour, inwardly of the colour of rusty iron. It has a fragrant smell, and a sweetish aromatic subacrid taste: the bark tastes much stronger than any other part; and the small twigs stronger than the large pieces. As to the virtues of this root, it is a warm aperient and corroborant; and frequently employed, with good success, for purifying and sweetening the blood and juices. For these purposes, infusions made from the rasped root or bark may be drank as tea. In some constitutions, these liquors, by their fragrance, are apt, on first taking them, to affect the head: in such cases, they may be advantagiously freed from their flavour by boiling; a decoction of sassafras, boiled down to the consistence of an extract, proves simply bitterish and subastringent. Hoffman assures us, that he has frequently given this extract to the quantity of a scruple at a time, with remarkable success, for strengthening the tone of the viscera in cachexies; as also in the decline of intermittent fevers, and in hypochondriacal spasms. Sassafras yields in distillation an extremely fragrant oil, of a penetrating pungent taste, so ponderous (notwithstanding the lightness of the drug itself) as to sink in water. Rectified spirit extracts the whole taste and smell of sassafras: and elevates nothing in evaporation: hence the spirituous extract proves the most elegant and efficacious preparations, as containing the virtue of the root entire.

The only officinal preparation of sassafras is the essential oil. The sassafras itself is an ingredient in the decoction of the woods and the compound lime waters, and the oil in the elixir guaiacinum.

LAUSANNE, a city of Switzerland, in the canton of Bern, situated on the north side of the lake of Geneva: E. lon. 6° 31′, and N. lat. 46° 33′.

L A W.

LAW may be defined, "The command of the sovereign power, containing a common rule of life for the subjects." It is divided into the law of nature, the law of nations, and civil or municipal law.

1. The law of nature is that which God has prescribed to all men, by the internal dictate of reason alone. It is discovered by a just consideration of the agreeableness or disagreeableness of human actions to the nature of man; and

and comprehends all the duties we owe either to the Supreme Being, to ourfelves, or to our neighbour; as reverence to God, felf-defence, temperance, honour to our parents, benevolence to all, a ftrict adherence to our engagements, gratitude, *&c.* The law of nature, where it either commands or forbids, is immutable, and cannot be controlled by any human authority; but where that law does no more than confer a right, without obliging us to ufe it, the fupreme power may diveft us thereof, in whole or in part.

2. The law of nations is alfo the refult of reafon, and has God for its author; but it fuppofes mankind formed into feveral bodies politic, or ftates; and comprifes all the duties which one ftate owes to another. Thefe muft of neceffity be fimilar to the duties arifing between individuals, fince both are dictated by reafon; fo that what is the law of nature when applied to men confidered fimply as fuch, is indeed the law of nations when applied to kingdoms or ftates. From this fource proceed the rights of war, the fecurity of ambaffadors, the obligations arifing from treaties, *&c.* The particular ufages of nations in their mutual correfpondence which are not neceffarily founded in reafon, are no part of the law of nations in its proper fenfe: for they are arbitrary, and derive their fole authority from compact, either exprefs or prefumed; and may therefore, without violating the law of nature, be altered. For this reafon, they ought to be thrown into the clafs of pofitive laws, whofe obligation lafts no longer than the agreement upon which it is founded. Of this fort, are the ceremonial ufed in receiving and entertaining ambaffadors, the privileges indulged to fome of their fervants, the rules obferved in cartels for exchanging prifoners of war, *&c.*

3. Civil or municipal law, is that which every fovereign kingdom or ftate has appropriated to itfelf. The appellation of municipal was originally confined to the laws of *municipia*, or dependent ftates; but it came by degrees to fignify all civil laws without diftinction. No fovereign ftate can fubfift without a fupreme power, or a right of commanding in the laft refort; the fupreme power of one age cannot therefore be fettered by any enactment of a former age, otherwife it would ceafe to be fupreme. Hence the law laft in date derogates from prior laws.

PRINCIPLES OF THE LAW OF SCOTLAND.

Title I. *General Obfervations.*

1. The municipal law of Scotland, as of moft other countries, confifts partly of ftatutory or written law, which has the exprefs authority of the legiflative power; partly of cuftomary or unwritten law, which derives force from its prefumed or tacit confent.

2. Under our ftatutory or written law is comprehended, (1.) Our acts of parliament: not only thofe which were made in the reign of James I. of Scotland, and from thence down to our union with England in 1707, but fuch of the Britifh ftatutes enacted fince the union as concern this part of the united kingdom.

3. The remains of our ancient written law were publifhed by Sir John Skene clerk-regifter, in the beginning of the laft century, by licence of parliament. The books of *Regiam Majeftatem*, to which the whole collection owes its title, feem to be a fyftem of Scots law, written by a private lawyer at the command of David I.; and though no exprefs confirmation of that treatife by the legiflature appears, yet it is admitted to have been the ancient law of our kingdom by exprefs ftatutes. The borough-laws, which were alfo enacted by the fame king David, and the ftatutes of William, Alexander II. David II. and the three Roberts, are univerfally allowed to be genuine. Our parliaments have once and again appointed commiffions to revife and amend the *Regiam Majeftatem*, and the other ancient books of our law, and to make their report: but, as no report appears to have been made, nor confequently any ratification by parliament, none of thefe remains are received, as of proper authority, in our courts; yet they are of excellent ufe in proving and illuftrating our moft ancient cuftoms.

4. Our written law comprehends, (2.) The acts of federunt, which are ordinances for regulating the forms of proceeding before the court of feffion in the adminiftration of juftice, made by the judges, who have a delegated power from the legiflature for that purpofe. Some of thefe acts dip upon matter of right, which declare what the judges apprehend to be the law of Scotland, and what they are to obferve afterwards as a rule of judgment.

5. The civil or Roman and canon laws, though they are not perhaps to be deemed proper parts of our written law, have undoubtedly had the greateft influence in Scotland. The powers exercifed by our fovereigns and judges have been juftified upon no other ground, than that they were conformable to the civil or canon laws; and a fpecial ftatute was judged neceffary, upon the reformation, to refcind fuch of their conftitutions as were repugnant to the Proteftant doctrine. From that period, the canon law has been little refpected, except in queftions of tithes, patronages, and fome few more articles of ecclefiaftical right: But the Roman continues to have great authority in all cafes where it is not derogated from by ftatute or cuftom, and where the genius of our law fuffers us to apply it.

6. Our unwritten or cuftomary law, is that which, without being exprefsly enacted by ftatute, derives its force from the tacit confent of king and people; which confent is prefumed from the ancient cuftom of the community. Cuftom, as it is equally founded in the will of the lawgiver with written law, has therefore the fame effects: Hence, as one ftatute may be explained by another, fo a ftatute may be explained or repealed by the uniform practice of the community, and even go into difufe by a pofterior contrary cuftom. But this power of cuftom to derogate from prior ftatutes, is generally confined by lawyers to ftatutes concerning private right, and does not extend to thofe which regard public policy.

7. An

7. An uniform tract of the judgments or decisions of the court of session, is commonly considered as part of our customary law; and without doubt, where a particular custom is thereby fixed or proved, such custom of itself constitutes law: But decisions, though they bind the parties litigating, have not, in their own nature, the authority of law in similar cases; yet, where they continue uniform, great weight is justly laid on them. Neither can the judgments of the house of peers of Great Britain reach farther than to the parties in the appeal, since in these the peers act as judges, not as lawgivers.

8. Though the laws of nature are sufficiently published by the internal suggestion of natural light, civil laws cannot be considered as a rule for the conduct of life, till they are notified to those whose conduct they are to regulate. The *Scots* acts of parliament were, by our most ancient custom, proclaimed in all the different shires, boroughs, and baron-courts of the kingdom. But after our statutes came to be printed, that custom was gradually neglected; and at last, the publication of our laws, at the market-cross of Edinburgh, was declared sufficient; and they became obligatory forty days thereafter. *British* statutes are deemed sufficiently notified, without formal promulgation; either because the printing is truly a publication, or because every subject is, by a maxim of the English law, party to them, as being present in parliament, either by himself or his representative. After a law is published, no pretence of ignorance can excuse the breach of it.

9. As laws are given for the rule of our conduct, they can regulate future cases only; for past actions, being out of our power, can admit of no rule. Declaratory laws form no exception to this; for a statute, where it is declaratory of a former law, does no more than interpret its meaning; and it is included in the notion of interpretation, that it must draw back to the date of the law interpreted.

10. By the rules of interpreting statute-law received in Scotland, an argument may be used from the title to the act itself, *a rubro ad nigrum;* at least, where the rubric has been either originally framed, or afterwards adopted by the legislature. The preamble or narrative, which recites the inconveniences that had arisen from the former law, and the causes inducing the enactment, may also lead a judge to the general meaning of the statute. But the chief weight is to be laid on the statutory words.

11. Laws, being directed to the unlearned as well as the learned, ought to be construed in their most obvious meaning, and not explained away by subtle distinctions; and no law is to suffer a figurative interpretation, where the proper sense of the words is as commodious, and equally fitted to the subject of the statute. Laws ought to be explained so as to exclude absurdities, and in the sense which appears most agreeable to former laws, to the intention of the lawgiver, and to the general frame and structure of the constitution. In prohibitory laws, where the right of acting is taken from a person, solely for the private advantage of another, the consent of him, in whose behalf the law was made, shall support the act done in breach of it; but the consent of parties immediately interested has no effect in matters which regard the public utility of a state. Where the words of a statute are capable but of one meaning, the statute must be observed, however hard it may bear on particular persons. Nevertheless, as no human system of laws can comprehend all possible cases, more may be sometimes meant by the lawgiver than is expressed; and hence certain statutes, where extension is not plainly excluded, may be extended beyond the letter, to similar and omitted cases: others are to be confined to the statutory words.

12. A strict interpretation is to be applied, 1. To correctory statutes, which repeal or restrict former laws, and to statutes which enact heavy penalties, or restrain the natural liberties of mankind. 2. Laws, made on occasion of present exigencies in a state, ought not to be drawn to similar cases, after the pressure is over. 3. Where statutes establish certain solemnities as requisite to deeds, such solemnities are not suppliable by equivalents; for solemnities lose their nature, when they are not performed specifically. 4. A statute, which enumerates special cases, is, with difficulty, to be extended to cases not expressed; but, where a law does not descend to particulars, there is greater reason to extend it to similar cases. 5. Statutes, which carry a dispensation or privilege to particular persons or societies, suffer a strict interpretation; because they derogate from the general law, and imply a burden upon the rest of the community. But at no rate can a privilege be explained to the prejudice of those in whose behalf it was granted. As the only foundation of customary law is usage, which consists in fact, such law can go no farther than the particular usage has gone.

13. All statutes, concerning matters specially favoured by law, receive an ample interpretation; as laws for the encouragement of commerce, or of any useful public undertaking, for making effectual the wills of dying persons, for restraining fraud, for the security of creditors, *&c.* A statute, though its subject-matter should not be a favourite of the law, may be extended to similar cases, which did not exist when the statute was made; and for which, therefore, it was not in the lawgiver's power to provide.

14. Every statute, however unfavourable, must receive the interpretation necessary to give it effect: And, on the other hand, in the extension of favourable laws, scope must not be given to the imagination, in discovering remote resemblances; the extension must be limited to the cases immediately similar. Where there is ground to conclude that the legislature has omitted a case out of the statute purposely, the statute cannot be extended to that case, let it be ever so similar to the cases expressed.

Tit. 2. *Of Jurisdiction and Judges in general.*

1. The object of law are persons, things, and actions: among persons, judges, who are invested with jurisdiction, deserve the first consideration. Jurisdiction is a power conferred upon a judge or magistrate, to take cognisance of, and decide causes according to law, and to carry his sentences into execution. That tract of ground, or district, within which a judge has the right of jurisdiction,

is

is called his territory: and every act of jurisdiction, exercised by a judge without his territory, either by pronouncing sentence, or carrying it into execution, is null.

2. The supreme power, which has the right of enacting laws, falls naturally to have the right of erecting courts, and appointing judges, who may apply these laws to particular cases: But, in Scotland, this right has been always intrusted with the Crown, as having the executive power of the state.

3. Jurisdiction is either supreme, inferior, or mixed. That jurisdiction is supreme, from which there lies no appeal to a higher court. Inferior courts are those whose sentences are subject to the review of the supreme courts, and whose jurisdiction is confined to a particular territory. Mixed jurisdiction participates of the nature both of the supreme and inferior: thus, the judge of the high court of Admiralty, and the commissaries of Edinburgh, have an universal jurisdiction over Scotland, and they can review the decrees of inferior admirals and commissaries; but since their own decrees are subject to the review of the courts of Session or Justiciary, they are, in that respect, inferior courts.

4. Jurisdiction is either civil or criminal: by the first, questions of private right are decided; by the other, crimes are punished. But, in all jurisdiction, though merely civil, there is a power inherent in the judge to punish, either corporally, or by a pecuniary fine, those who offend during the proceedings of the court, or who shall afterwards obstruct the execution of the sentence.

5. Jurisdiction is either privative or cumulative. Privative jurisdiction, is that which belongs only to one court, to the exclusion of all others. Cumulative, otherwise called concurrent, is that which may be exercised by any one of two or more courts, in the same cause. In civil cumulative jurisdiction, the private pursuer has the right of election before which of the courts he shall sue; but as, in criminal questions which are prosecuted by a public officer of court, a collision of jurisdiction might happen, through each of the judges claiming the exercise of their right, that judge, by whose warrant the delinquent is first cited or apprehended, (which is the first step of jurisdiction), acquires thereby (*jure præventionis*) the exclusive right of judging in the cause.

6. All rights of jurisdiction, being originally granted in consideration of the fitness of the grantee, were therefore personal, and died with himself. But, upon the introduction of the feudal system, certain jurisdictions were annexed to lands, and descended to heirs, as well as the lands to which they were enexed; but now all heritable jurisdictions, except those of admiralty and a small pittance reserved to barons, are either abolished, or resumed and annexed to the crown.

7. Jurisdiction is either proper or delegated. Proper jurisdiction, is that which belongs to a judge or magistrate himself, in virtue of his office. Delegated, is that which is communicated by the judge to another who acts in his name, called a depute or deputy. Where a deputy appoints one under him, he is called a substitute. No grant of jurisdiction, which is an office requiring personal qualifications, can be delegated by the grantee to another, without an express power in the grant.

8. Civil jurisdiction is founded, 1. *Ratione domicilii*, if the defender has his domicile within the judge's territory. A domicile is the dwelling-place where a person lives with an intention to remain; and custom has fixed it as a rule, that residence for forty days founds jurisdiction. If one has no fixed dwelling-place, *e. g.* a soldier, or a travelling-merchant, a personal citation against him within the territory is sufficient to found the judge's jurisdiction over him, even in civil questions. As the defender is not obliged to appear before a court to which he is not subject, the pursuer must follow the defender's domicile.

9. It is founded, 2. *Ratione rei sitæ*, if the subject in question lie within the teritory. If that subject be immoveable, the judge, whose jurisdiction is founded in this way, is the sole judge competent, excluding the judge of the domicile.

10. Where one, who has not his domicile within the territory, is to be sued before an inferior court *ratione rei sitæ*, the court of session must be applied to, whose jurisdiction is universal, and who, of course, grants letters of supplement to cite the defender to appear before the inferior judge. Where the party to be sued resides in another kingdom, and has an estate in this, the court of session is the only proper court, as the *commune forum* to all persons residing abroad; and the defender, if his estate be heritable, is considered as lawfully summoned to that court, by a citation at the market-cross of Edinburgh, and pier and shore of Leith: but where a stranger, not a native of Scotland, has only a moveable estate in this kingdom, he is deemed to be so little subject to the jurisdiction of our courts, that action cannot be brought against him till his effects be first attached by an arrestment *jurisdictionis fundandæ causa*, *Harc.* 487, which is laid on by a warrant issuing from the supreme courts of session, or admiralty, or from that within whose territory the subject is situated, at the suit of the creditor.

11. A judge may, in special cases, arrest or secure the persons of such as have neither domicile nor estate within his territory, even for civil debts. Thus, on the border between Scotland and England, warrants are granted of course by the judge-ordinary of either side, against those who have their domicile upon the opposite side, for arresting their persons, till they give caution *judicio sisti*: and even the persons of citizens or natives may be so secured, where there is just reason to suspect that they are *in meditatione fugæ*, i. e. that they intend suddenly to withdraw from the kingdom; upon which suspicion, the creditor who applies for the warrant must make oath. An inhabitant of a borough-royal, who has furnished one who lives without the borough in meat, cloaths, or other merchandize, and who has no security for it but his own compt-book, may arrest his debtor, till he give security *judicio sisti*.

12. A judge may be declined, *i. e.* his jurisdiction disowned judicially, 1. *Ratione causæ*, from his incompetency to the special cause brought before him. 2. *Ratione suspecti judicis*; where either the judge himself, or his near kinsman, has an interest in the suit. No judge can vote in the cause of his father, brother, or son, either by consanguinity or affinity; nor in the cause of his uncle or nephew by consanguinity. 3. *Ratione privilegii*;

vilegii; where the party is by privilege exempted from their jurifdiction.

13 Prorogated jurifdiction *(jurifdictio in confentientes)* is that which is, by the confent of parties, conferred upon a judge, who, without fuch confent, would be incompetent. Where a judge is incompetent, every ftep he takes muft be null, till his jurifdiction be made competent by the parties actual fubmiffion to it. It is otherwife where the judge is competent, but may be declined by the party upon privilege.

14. In order to prorogation, the judge muft have jurifdiction, fuch as may be prorogated. Hence, prorogation cannot be admitted where the judge's jurifdiction is excluded by ftatute. Yet where the caufe is of the fame nature with thofe to which the judge is competent, though law may have confined his jurifdiction within a certain fum, parties may prorogate it above that fum unlefs where prorogation is prohibited. Prorogation is not admitted in the king's caufes; for the intereft of the Crown cannot be hurt by the negligence of its officers.

15. All judges muft at their admiffion fwear, 1. The oath of allegiance, and fubfcribe the affurance; 2. The oath of abjuration; 3. The oath of fupremacy; laftly, The oath *de fideli adminiftratione*.

16. A party who has either properly declined the jurifdiction of the judge before whom he had been cited, or who thinks himfelf aggrieved by any proceedings in the caufe, may, before decree, apply to the court of feffion to iffue letters of advocation for calling the action from before the inferior court to themfelves. The grounds therefore, upon which a party may pray for letters of advocation, are incompetency and iniquity. Under incompetency, is comprehended not only defect of jurifdiction, but all the grounds of declining a jurifdiction, in itfelf competent, arifing either from fufpicion of the judge, or privilege in the parties. A judge is faid to commit iniquity, when he either delays juftice, or pronounces fentence, in the exercife of his jurifdiction, contrary to law.

17. That the court of feffion may not wafte their time in trifles, no caufe for a fum below twelve pound Sterling can be advocated to the court of feffion from the inferior judge competent: but if an inferior judge fhall proceed upon a caufe to which he is incompetent, the caufe may be carried from him by advocation, let the fubject be ever fo inconfiderable.

Tit. 3. *Of the fupreme Judges and Courts of* Scotland.

1. The King, who is the fountain of jurifdiction, might by our conftitution have judged in all caufes, either in his own perfon, or by thofe whom he was pleafed to veft with jurifdiction.

2. The parliament of Scotland, as our court of the laft refort, had the right of reviewing the fentences of all our fupreme courts.

3. By the treaty of union, 1707, the parliaments of Scotland and England are united into one parliament of Great Britain. From this period, the Britifh houfe of Peers, as coming in place of the Scots parliament, is become our court of the laft refort, to which appeals lie from all the fupreme courts of Scotland: But that court has no original jurifdiction in civil matters, in which they judge only upon appeal. By *art.* 22. of that treaty, the Scots fhare of the reprefentation in the houfe of Peers is fixed to fixteen Scots peers elective; and in the houfe of Commons, to forty-five commoners, of which thirty are elected by the freeholders of counties, and fifteen by the royal boroughs. The Scots privy council was alfo thereupon abolifhed, and funk into that of Great Britain, which for the future is declared to have no other powers than the Englifh privy council had at the time of the union.

Court of Session.

4. A court was erected in 1425, confifting of certain perfons to be named by the king, out of the three eftates of parliament, which was vefted with the jurifdiction formerly lodged in the privy council, and got the name of the Seffion, becaufe it was ordained to hold annually a certain number of feffions at the places to be fpecially appointed by the king. This court had a jurifdiction, cumulative with the judge ordinary, in fpuilzies, and other poffeffory actions, and in debts; but they had no cognizance in queftions of property of heritable fubjects. No appeal lay from its judgments to the parliament. The judges of this court ferved by rotation, and were changed from time to time, after having fat forty days; and became fo negligent in the adminiftration of juftice, that it was at laft thought neceffary to transfer the jurifdiction of this court to a council to be named by the king, called the daily council.

5. The prefent model of the court of feffion, or college of juftice, was formed in the reign of James V. The judges thereof, who are vefted with an univerfal civil jurifdiction, confifted originally of feven churchmen, feven laymen, and a prefident, whom it behoved to be a prelate; but fpiritual judges were in 1584 partly, and in 1640 totally prohibited. The judges of feffion have been always received by warrants from the crown. Anciently his Majefty feems to have transferred to the court itfelf the right of chufing their own prefident; and in a federunt recorded June 26. 1593, the king condefcended to prefent to the lords, upon every vacancy in the bench, a lift of three perfons, out of which they were to chufe one. But his Majefty foon refumed the exercife of both rights, which continued with the Crown till the ufurpation; when it was ordained, that the king fhould name the judges of the feffion, by the advice of parliament. After the reftoration, the nomination was again declared to be folely in the Sovereign.

6. Though judges may, in the general cafe, be named at the age of twenty-one years, the lords of feffion muft be at leaft twenty-five. No perfon can be named lord of feffion, who has not ferved as an advocate or principal clerk of feffion for five years, or as a writer to the fignet for ten: and in the cafe of a writer to the fignet, he muft undergo the ordinary trials upon the Roman law, and be found qualified two years before he can be named. Upon a vacancy in the bench, the king prefents the fucceffor by a letter addreffed to the lords, wherein he requires them to try and admit the perfon prefented. The powers given them to reject the prefentee upon trial are taken

taken away, and a bare liberty to remonſtrate ſubſtituted in its place.

7. Beſides the fifteen ordinary judges, the king was allowed to name three or four lords of his great council, who might ſit and vote with them. Theſe extraordinary lords were ſuppreſſed in the reign of Geo. I.

8. Though the juriſdiction of the ſeſſion be properly limited to civil cauſes, the judges have always ſuſtained themſelves as competent to the crime of falſehood. Where the falſehood deſerves death or demembration, they, after finding the crime proved, remit the criminal to the court of juſticiary. Special ſtatute has given to the court of ſeſſion juriſdiction in contraventions of law-burrows, deforcements, and breach of arreſtment; and they have been in uſe to judge in battery *pendente lite*, and in uſury.

9. In certain civil cauſes, the juriſdiction of the ſeſſion is excluſive of all inferior juriſdictions; as in declarators of property, and other competitions of heritable rights, provings of the tenor, *ceſſiones bonorum*, reſtitution of minors, reductions of decrees or of writings, ſales of the eſtates of minors or bankrupts, *&c.* In a ſecond claſs of cauſes, their juriſdiction can be only exerciſed in the way of review, after the cauſe is brought from the inferior court; as in maritime and conſiſtorial cauſes, which muſt be purſued in the firſt inſtance before the admiral or commiſſary; and in actions below twelve pounds Sterling, which muſt be commenced before the judge-ordinary. In all civil actions, which fall under neither of theſe claſſes, the juriſdiction of the ſeſſion is concurrent, even in the firſt inſtance, with that of the judge-ordinary. The ſeſſion may proceed as a court of equity by the rules of conſcience, in abating the rigour of law, and giving aid in proper caſes to ſuch as in a court of law can have no remedy: and this power is inherent in the ſupreme court of every country, where ſeparate courts are not eſtabliſhed for law and for equity.

Court of Justiciary.

10. The ſupreme criminal judge was ſtyled the Juſticiar; and he had anciently an univerſal civil juriſdiction, even in matters of heritage. He was obliged to hold two juſtice courts or ayres yearly at Edinburgh or Peebles, where all the free-holders of the kingdom were obliged to attend. Beſides this univerſal court, ſpecial juſtice-ayres were held in all the different ſhires of the kingdom twice in the year. Theſe laſt having gone into diſuſe, eight deputies were appointed, two for every quarter of the kingdom, who ſhould make their circuits over the whole in April and October.

11. The office of deputies was ſuppreſſed in 1972; and five lords of ſeſſion were added, as commiſſioners of Juſticiary, to the juſtice-general and juſtice-clerk. The juſtice-general, if preſent, is conſtant preſident of the court, and in his abſence the juſtice-clerk. The kingdom is divided into three diſtricts, and two of the judges are appointed to hold circuits in certain boroughs of each diſtrict twice in the year; one judge may proceed to buſineſs in the abſence of his collegue.

12. By an old ſtatute, the crimes of robbery, rape, murder, and wilful fire raiſing, (the four pleas of the Crown), are ſaid to be reſerved to the King's court of Juſticiary; but the only crime in which, *de praxi*, the juriſdiction of Juſticiary became at laſt excluſive of all inferior criminal juriſdiction, was that of high treaſon. The court of Juſticiary, when ſitting at Edinburgh, has a power of advocating cauſes from all inferior criminal judges, and of ſuſpending their ſentences.

13. The circuit-court can alſo judge in all criminal cauſes which do not infer death or demembration, upon appeal from any inferior court within their diſtrict; and has a ſupreme civil juriſdiction, by way of appeal, in all cauſes not exceeding twelve pounds Serling, in which their decrees are not ſubject to review; but no appeal is to lie to the circuit, till the cauſe be finally determined in the inferior court.

Court of Exchequer.

14. The court of Exchequer, as the King's chamberlain court, judged in all queſtions of the revenue. In purſuance of the treaty of Union, that court was aboliſhed, and a new court erected, conſiſting of the Lord High Treaſurer of Great Britain, and a chief Baron, with four other Barons of Exchequer; which Barons are to be made of ſerjeants at law, Engliſh barriſters, or Scots advocates of five years ſtanding. This court has a privative juriſdiction conferred upon it, as to the duties of cuſtoms, exciſe, or other revenues appertaining to the King or Prince of Scotland, and as to all honours and eſtates that may accrue to the crown; in which matters, they are to judge by the forms of proceeding uſed in the Engliſh court of Exchequer, under the following limitations; that no debt due to the Crown ſhall affect the debtor's real eſtate in any other manner than ſuch eſtate may be affected by the laws of Scotland, and that the validity of the Crown's titles to any honours or lands ſhall continue to be tried by the court of Seſſion. The Barons have the powers of the Scots court transferred to them, of paſſing the accounts of ſheriffs, or other officers who have the execution of writs iſſuing from, or returnable to the court of Exchequer, and of receiving reſignations, and paſſing ſignatures of charters, gifts of caſualties, *&c.* But though all theſe muſt paſs in Exchequer, it is the court of Seſſion only who can judge of their preference after they are completed.

Admiral Court.

15. The juriſdiction of the Admiral in maritime cauſes was of old concurrent with that of the Seſſion. The High-admiral is declared the King's Juſtice-General upon the ſeas, on freſh water within flood-mark, and in all harbours and creeks. His civil juriſdiction extends to all maritime cauſes, and ſo comprehends queſtions of charter parties, freights, ſalvages, bottomries, *&c.* He exerciſes this ſupreme juriſdiction by a delegate, the judge of the high-court of admiralty; and he may alſo name inferior deputies, whoſe juriſdiction is limited to particular diſtricts, and whoſe ſentences are ſubject to the review of the high court. In cauſes which are declared to fall under the Admiral's cogniſance, his juriſdiction is now ſole; in ſo much that the Seſſion itſelf, though they may review his decrees by ſuſpenſion or reduction, cannot

not carry a maritime queſtion from him by advocation. The Admiral has acquired, by uſage, a juriſdiction in mercantile cauſes, even where they are not ſtrictly maritime, cumulative with that of the judge-ordinary.

16. All our ſupreme courts have ſeals or ſignets, proper to their ſeveral juriſdictions. The courts of Seſſion and Juſticiary uſed formerly the ſame ſignet, which was called the King's, becauſe the writs iſſuing from thence run in the King's name; and though the Juſticiary got at laſt a ſeparate ſignet for itſelf, yet that of the Seſſion ſtill retains the appellation of the *King's Signet*. In this office are ſealed ſummonſes for citation, letters of executorial diligence, or for ſtaying or prohibiting of diligence, and generally whatever paſſes by the warrant of the Seſſion, and is to be executed by the officers of the court. All theſe muſt, before ſealing, be ſigned by the writers or clerks of the ſignet: But letters of diligence, where they are granted in a depending proceſs, merely for probation, though they paſs by the ſignet, muſt be ſubſcribed by a clerk of Seſſion. The clerks of the ſignet alſo prepare and ſubſcribe all ſignatures of charters, or other royal grants, which paſs in Exchequer.

Tit. 4. *Of the inferior Judges and Courts of* Scotland.

Sheriff.

Sheriff, from *reeve*, governor, and *ſheer*, to cut or divide, is the judge ordinary conſtituted by the Crown over a particular diviſion or county. The Sheriff's juriſdiction, both civil and criminal, was, in ancient times, nearly as ample within his own territory as that of the ſupreme courts of Seſſion and Juſticiary was over the whole kingdom.

2. His civil juriſdiction now extends to all actions upon contracts, or other perſonal obligations, forthcomings, poindings of the ground, mails and duties, and to all poſſeſſory actions, as removings, ejections, ſpuilzies, *&c.* to all brieves iſſuing from the chancery, as of inqueſt, terce, diviſion, tutory, *&c.* and even to adjudications of land-eſtates, when proceeding on the renunciation of the apparent heir. His preſent criminal juriſdiction extends to certain capital crimes, as theft, and even murder, though it be one of the pleas of the Crown; and he is competent to moſt queſtions of public police, and has a cumulative juriſdiction with juſtices of the peace in all riots and breaches of the peace.

3. Sheriffs have miniſterial power, in virtue of which, they return juries, in order to the trial of cauſes that require juries. The writs for electing members of parliament have been, ſince the union, directed to the Sheriffs, who, after they are executed, return them to the crown-office from whence they iſſued. They alſo execute writs iſſuing from the court of Exchequer; and in general, take care of all eſtates, duties, or caſualties that fall to the Crown within their territory, for which they muſt account to the Exchequer.

Lord of Regality.

4. A Lord of Regality was a magiſtrate, who had a grant of lands from the Sovereign, with royal juriſdiction annexed thereto. His civil juriſdiction was equal to that of a Sheriff; his criminal extended to the four pleas of the crown. He had a right to repledge or reclaim all criminals, ſubject to his juriſdiction, from any other competent court, though it were the Juſticiary itſelf, to his own. He had alſo right, according to the moſt common opinion, to the ſingle eſcheat of all denounced perſons reſiding within his juriſdiction, even though ſuch privilege had not been expreſſed in the grant of regality.

Stewart.

5. The Stewart was the magiſtrate appointed by the King over ſuch regality lands as happened to fall to the Crown by forfeiture, *&c.* and therefore the ſtewart's juriſdiction was equal to that of a regality. The two ſtewartries of Kircudbright, and of Orkney and Zetland, make ſhires or counties by themſelves, and ſend each a repreſentative to parliament.

Bailie.

6. Where lands, not erected into a regality, fell into the King's hands, he appointed a Bailie over them, whoſe juriſdiction was equal to that of a Sheriff.

7. By the late juriſdiction act 20. *Geo.* II. all heritable regalities and bailieries, and all ſuch heritable ſheriffſhips and ſtewartries as were only parts of a ſhire, are diſſolved; and the powers formerly veſted in them are made to devolve upon ſuch of the King's courts as theſe powers would have belonged to if the juriſdictions diſſolved had never been granted. All ſheriffſhips and ſtewartries that were no part of a ſhire, where they had been granted, either heritably or for life, are reſumed and annexed to the crown. No High Sheriff or Stewart can hereafter judge perſonally in any cauſe. One Sheriff or Stewart-depute is to be appointed by the King in every ſhire, who muſt be an advocate of three years ſtanding; and after a certain term not yet expired, all commiſſions to theſe deputies are to be granted for life.

Prince of Scotland.

8. The appanage, or patrimony, of the Prince of Scotland, has been long erected into a regality-juriſdiction, called the Principality. It is perſonal to the King's eldeſt ſon, upon whoſe death or ſucceſſion it returns to the Crown. The prince has, or may have, his own chancery, from which his writs iſſue, and may name his own chamberlain and other officers for receiving and managing his revenue. The vaſſals of the Prince are intitled to elect, or to be elected members of Parliament for counties, equally with thoſe who hold of the Crown.

Justices of the Peace.

9. Juſtices of the Peace are magiſtrates named by the Sovereign over the ſeveral counties of the kingdom, for the ſpecial purpoſe of preſerving the public peace. Anciently their power reached little farther than to bind over diſorderly perſons for their appearance before the Privy Council or Juſticiary; afterwards they were authoriſed to judge in breaches of the peace, and in moſt of the laws concerning public policy. They may compel workmen or labourers to ſerve for a reaſonable fee, and

they

they can condemn masters in the wages due to their servants. They have power to judge in questions of highways, and to call out the tenants with their cotters and servants to perform six days work yearly for upholding them.

10. Since the Union, our justices of the peace, over and above the powers committed to them by the laws of Scotland, are authorised to exercise whatever belonged to the office of an English justice of the peace, in relation to the public peace. From that time, the Scots and the English commissions have run in the same style, which contain powers to inquire into, and judge in all capital crimes, witchcrafts, felonies, and several others specially enumerated, with this limitation subjoined, *of which justices of the peace may lawfully inquire.* Two justices can constitute a court. Special statute has give the cognisance of several matters of excise to the justices, in which their sentences are final.

Boroughs.

11. A borough is a body-corporate, made up of the inhabitants of a certain tract of ground erected by the Sovereign, with jurisdiction annexed to it. Boroughs are erected, either to be holden of the Sovereign himself, which is the general case of royal boroughs; or of the superior of the lands erected, as boroughs of regality and barony. Boroughs-royal have power, by their charters, to chuse annually certain office-bearers or magistrates; and in boroughs of regality and barony, the nomination of magistrates is, by their charter, lodged sometimes in the inhabitants, sometimes in the superior. Bailies of boroughs have jurisdiction in matters of debt, services, and questions of possession betwixt the inhabitants. Their criminal jurisdiction extends to petty riots, and reckless fire-raising. The Dean of Guild is that magistrate of a royal borough, who is head of the merchant-company: he has the cognisance of mercantile causes within borough, and the inspection of buildings, that they incroach neither on private property, nor on the public streets; and he may direct insufficient houses to be pulled down. His jurisdiction has no dependance on the court of the borough, or bailie-court.

Barons.

12. A Baron, in the large sense of that word, is one who holds his lands immediately of the Crown; and, as such, had, by our ancient constitution, right to a seat in parliament, however small his freehold might have been. The lesser Barons were exempted from the burden of attending the service of parliament. This exemption grew insensibly into an utter disability in all the lesser Barons from sitting in parliament, without election by the county; though no statute is to be found expresly excluding them.

13. To constitute a Baron in the strict law-sense, his lands must have been erected, or at least confirmed by the King, *in liberam baroniam:* and such Baron had a certain jurisdiction, both civil and criminal, which he might have exercised, either in his own person, or by his bailie.

14. By the late jurisdiction-act, the civil jurisdiction of a Baron is reduced to the power of recovering, from his vassals and tenants, the rents of his lands, and of condemning them in mill-services; and of judging in causes where the debt and damages do not exceed 40 s. Sterling. His criminal jurisdiction is, by the same statute, limited to assaults, batteries, and other smaller offences, which may be punished by a fine not exceeding 20 s. Sterling, or by setting the offender in the stocks in the day-time not above three hours; the fine to be levied by poinding, or one month's imprisonment. The jurisdiction formerly competent to proprietors of mines, and coal or salt works, over their workmen, is reserved; and also that which was competent to proprietors who had the right of fairs or markets, for correcting the disorders that might happen during their continuance; provided they shall exercise no jurisdiction inferring the loss of life or demembration.

Constabularies.

15. The High Constable of Scotland had no fixed territorial jurisdiction, but followed the court; and had, jointly with the Marischal, the cognisance of all crimes committed within two leagues of it. All other constabularies were dependant on him: These had castles, and sometimes boroughs subject to their jurisdiction, as Dundee, Montrose, *&c.* and amongst other powers, now little known, they had the right of exercising criminal jurisdiction within their respective territories during the continuance of fairs. By the late jurisdiction-act, all jurisdictions of constabulary are dissolved, except that of High Constable.

Lyon King of Arms.

16. The office of the Lyon King of Arms was chiefly ministerial, to denounce war, proclaim peace, carry public messages, *&c.* But he has also a right of jurisdiction, whereby he can punish all who usurp arms contrary to the law of arms, and deprive or suspend messengers, heralds, or pursuivants, (who are officers named by himself;) but he has no cognisance of the damage arising to the private party through the messenger's fault. Messengers are subservient to the supreme courts of session and justiciary; and their proper business is to execute all the King's letters either in civil or criminal causes.

17. Our judges had, for a long time, no other salaries or appointments than what arose from the setences they pronounced. Our criminal judges applied to their own use the fines or issues of their several courts; and regalities had a right to the single escheat of all persons denounced, who resided within their jurisdiction; and our civil judges got a certain proportion of the sum contained in the decree pronounced. But these were all prohibited upon regular salaries being settled upon our judges.

Tit. 5. *Of Ecclesiastical Persons.*

The Pope, or bishop of Rome, was long acknowledged, over the western part of Christendom, for the head of the Christian church. The papal jurisdiction was abolished in Scotland *anno* 1560. The King was, by act 1669, declared to have supreme authority over all persons,

perſons, and in all cauſes eccleſiaſtical; but this act was repealed by 1690, as inconſiſtent with Preſbyterian church-government, which was then upon the point of being eſtabliſhed.

2. Before the reformation from Popery, the clergy was divided into ſecular and regular. The ſecular had a particular tract of ground given them in charge, within which they exerciſed the paſtoral office of biſhop, preſbyter, or other church officer. The regular clergy had no cure of ſouls, but were tied down to reſidence in their abbacies, priories, or other monaſteries: And they got the name of regular, from the rules of mortification to which they were bound, according to the inſtitution of their ſeveral orders. Upon the vacancy of any benefice, whether ſecular or regular, Commendators were frequently appointed to levy the fruits, as factors or ſtewards during the vacancy. The Pope alone could give the higheſt benefices *in commendam*; and at laſt, from the plenitude of his power, he came to name commendators for life, and without any obligation to account. After the reformation, ſeveral abbacies and priories were given by James VI. *in perpetuam commendam*, to laics.

3. Upon aboliſhing the Pope's authority, the regular clergy was totally ſuppreſſed; and, in place of all the different degrees which diſtinguiſhed the ſecular clergy, we had at firſt only parochial Preſbyters or Miniſters, and ſuperintendants, who had the overſight of the church within a certain diſtrict. Soon thereafter the church-government became epiſcopal, by Archbiſhops, Biſhops, *&c.* and after ſome intermediate turns, is now Preſbyterian by kirk-ſeſſions, preſbyteries, ſynods, and general aſſemblies.

4. Prelate, in our ſtatutes, ſignifies a Biſhop, Abbot, or other dignified clergyman, who in virtue of his office had a ſeat in parliament. Every Biſhop had his Chapter, which conſiſted of a certain number of the miniſters of the dioceſe, by whoſe aſſiſtance he managed the affairs of the church within that diſtrict. The nomination of Biſhops to vacant ſees has been in the crown ſince 1540, though under the appearance of continuing the ancient right of election, which was in the Chapter. The confirmation by the Crown under the great ſeal, of the Chapter's election, confirmed a right to the ſpirituality of the benefice; and a ſecond grant, upon the conſecration of the Biſhop-elect, gave a title to the temporality; but this ſecond grant fell ſoon into diſuſe.

5. He who founded or endowed a church was intitled to the right of patronage thereof, or *advocatio eccleſiæ*; whereby, among other privileges, he might preſent a churchman to the cure, in caſe of a vacancy. The preſentee, after he was received into the church, had a right to the benefice *proprio jure*; and if the church was parochial, he was called a parſon. The Pope claimed the right of patronage of every kirk, to which no third party could ſhew a ſpecial title; and ſince the reformation, the Crown, as coming in place of the Pope, is conſidered as univerſal patron, where no right of patronage appears in a ſubject. Where two churches are united, which had different patrons, each patron preſents by turns.

6. Gentlemen of eſtates frequently founded colleges or collegiate churches, the head of which got the name of Provoſt, under whom were certain Prebendaries or Canons, who had their ſeveral ſtalls in the church, where they ſung maſſes. Others of leſſer fortunes founded chaplainries, within the precincts of a parochial church; or altarages, which were donations granted for the ſinging of maſſes for deceaſed friends at particular altars in a church. Though all theſe were ſuppreſſed upon the reformation, their founders continued patrons of the endowments; out of which they were allowed to provide burſars, to be educated in any of the univerſities.

7. Where a fund is gifted for the eſtabliſhment of a ſecond miniſter in a pariſh where the cure is thought too heavy for one, the patronage of ſuch benefice does not belong to the donor, but to him who was patron of the church, unleſs either where the donor has reſerved to himſelf the right of patronage in the donation, or where he and his ſucceſſors have been in the conſtant uſe of preſenting the ſecond miniſter, without challenge from the patron. The right of preſenting incumbents was by 1690, *c.* 23. taken from patrons, and veſted in the heritors and elders of the pariſh, upon payment to be made by the heritors to the patron of 600 merks; but it was again reſtored to patrons, 10. *An. c.* 12. with the exception of the preſentations ſold in purſuance of the former act.

8. Patrons were not ſimply adminiſtrators of the church; for they held the fruits of the vacant benefice as their own, for ſome time after the reformation. But that right is now no more than a truſt in the patron, who muſt apply them to pious uſes within the pariſh, at the ſight of the heritors, yearly as they fall due. If he fail, he loſes his right of adminiſtring the vacant ſtipend for that and the next vacancy. The king, who is exempted from this rule, may apply the vacant ſtipend of his churches to any pious uſe, though not within the pariſh. If one ſhould be ordained to a church, in oppoſition to the preſentee, the patron, whoſe civil right cannot be affected by any ſentence of a church court, may retain the ſtipend as vacant. Patrons are to this day intitled to a ſeat and burial-place in the churches of which they are patrons; and to the right of all the teinds of the pariſh not heritably diſponed.

9. That kirks may not continue too long vacant, the patron muſt preſent to the preſbytery, (formerly to the Biſhop), a fit perſon for ſupplying the cure, within ſix months from his knowledge of the vacancy, otherwiſe the right of preſentation accrues to the preſbytery *jure devoluto*. Upon preſentation by the patron, the Biſhop collated or conferred the benefice upon the preſentee by a writing, in which he appointed certain miniſters of the dioceſe to induce or inſtitute him into the church; which induction completed his right, and was performed by their placing him in the pulpit, and delivering him the bible and the keys of the church. The biſhop collated to the churches of which himſelf was patron, *pleno jure*, or without preſentation; which he alſo did in menſal churches, whoſe patronages were ſunk, by the churches being appropriated to him, as part of his patrimony. Since the revolution, a judicial act of admiſſion by the preſbytery, proceeding either upon a preſentation, or up-

on a call from the heritors and elders, or upon their own *jus devolutum*, compleats the minister's right to the benefice.

10. Soon after the reformation, the Popish churchmen were prevailed upon to resign in the sovereign's hands, a third of their benefices, which was appropriated, in the first place, for the subsistence of the reformed clergy. To make this fund effectual, particular localities were assigned in every benefice, to the extent of a third, called the assumption of thirds; and for the farther support of ministers, Queen Mary made a grant in their favour of all the small benefices not exceeding 300 merks. Bishops, by the act which restored them to the whole of their benefices, were obliged to maintain the ministers within their dioceses, out of the thirds; and in like manner, the lay titulars, who got grants of the teinds, became bound, by their acceptation thereof, to provide the kirks within their erections in competent stipends.

11. But all these expedients for the maintenance of the clergy having proved ineffectual, a commission of parliament was appointed in the reign of James VI. for planting kirks, and modifying stipends to ministers out of the teinds; and afterwards several other commissions were appointed, with the more ample powers of dividing large parishes, erecting new ones, *&c.* all of which were, in 1707, transferred to the court of Session, with this limitation, that no parish should be disjoined, nor new church erected, nor old one removed to a new place, without the consent of three fourths of the heritors, computing the votes, not by their numbers, but by the valuation of their rents within the parish. The Judges of Session, when sitting in that court, are considered as a commission of Parliament, and have their proper clerks, macers, and other officers of court, as such.

12. The lowest stipend that could be modified to a minister by the first commission was 500 merks, or five chalders of victual, unless where the whole teinds of the parish did not extend so far. And the highest was 1000 merks, or ten chalders. The parliament 1633 raised the *minimum* to eight chalders of victual, and proportionably in silver; but as neither the commission appointed by that act, nor any of the subsequent ones, was limited as to the *maximum*, the commissioners have been in use to augment stipends considerably above the old *maximum*, where there is sufficiency of free teinds, and the cure is burdensome, or living expensive.

13. Where a certain quantity of stipend is modified to a minister out of the teinds of a parish without proportioning that stipend among the several heritors, the decree is called *a decree of modification*: But where the commissioners also fix the particular proportions payable by each heritor, it is a decree of *modification and locality*. Where a stipend is only modified, it is secured on the whole teinds of the parish; so that the minister can insist against any one heritor to the full extent of his teinds, such heritor being always entitled to relief against the rest, for what he shall have paid above his just share: But where the stipend is also localled, each heritor is liable in no more than his own proportion.

14. Few of the reformed ministers were, at first, provided with dwelling houses: most of the Popish clergy having, upon the first appearance of the reformation, let their manses in feu, or in long tacks: Ministers therefore got a right, by 1563, to as much of these manses as would serve them, notwithstanding such feus or tacks. Where there was no parson's nor vicar's manse, one was to be built by the heritors, at the sight of the bishop, (now the Presbytery), the charge not exceeding L. 1000 Scots, nor below 500 merks. Under a manse are comprehended stable, barn, and byre, with a garden; for all which, it is usual to allow half an acre of ground.

15. Every incumbent is intitled at his entry to have his manse put into good condition; for which purpose, the presbytery may appoint a visitation by tradesmen, and order estimates to be laid before them of the sums necessary for the repairing, which they may proportion among the heritors according to their valuations. The presbytery, after the manse is made sufficient, ought, upon application of the heritors, to declare it a free manse, which lays the incumbent under an obligation to uphold it in good condition during his incumbency; otherwise, he or his executors shall be liable in damages. But they are not bound to make up the loss arising from the necessary decay of the building by the waste of time.

16. All ministers, where there is any landward or country parish, are, over and above their stipend, intitled to a glebe, which comprehends four acres of arable land, or sixteen sowms of pasture-ground where there is no arable land, (a sowm is what will graze ten sheep or one cow), and is to be designed or marked by the bishop or presbytery out of such kirk-lands within the parish as lie nearest to the kirk, and, in default of kirk-lands, out of temporal lands.

17. A right of relief is competent to the heritors, whose lands are set off for the manse or glebe, against the other heritors of the parish. Manses and glebes, being once regularly designed, cannot be feued or sold by the incumbent in prejudice of his successors; which is in practice extended even to the case where such alienation evidently appears profitable to the benefice.

18. Ministers, besides their glebe, are intitled to grass for a horse and two cows. And, if the lands out of which the grass may be designed, either lie at a distance, or are not fit for pasture, the heritors are to pay to the minister L. 20 Scots yearly as an equivalent. Ministers have also freedom of foggage, pasturage, fewel, feal, divot, loaning, and free ish and entry, according to use and wont: What these privileges are, must be determined by the local custom of the several parishes.

19. The legal terms at which stipends become due to ministers, are Whitsunday and Michaelmas. If the incumbent be admitted to his church before Whitsunday, till which term the corns are not presumed to be fully sown, he has right to that whole year's stipend; and, if he is received after Whitsunday, and before Michaelmas, he is intitled to the half of that year; because, tho' the corns were sown before his entry, he was admitted before the term at which they are presumed to be reaped. By the same reason, if he dies or is transported before Whitsunday, he has right to no part of that year; if before Michaelmas, to the half; and if not till after Michaelmas, to the whole.

20. After the miniſter's death, his executors have right to the annat; which, in the ſenſe of the canon law, was a right reſerved to the Pope, of the firſt year's fruits of every benefice. Upon a threatened invaſion from England *anno* 1547, the annat was given by our Parliament, notwithſtanding this right in the Pope, to the executors of ſuch churchmen as ſhould fall in battle in defence of their country: But the word annat or ann, as it is now underſtood, is the right which law gives to the executors of miniſters, of half a year's benefice, over and above what was due to the miniſter himſelf for his incumbency.

21. The executors of a miniſter need make up no title to the ann by confirmation: Neither is the right aſſignable by the miniſter, or affectable with his debts; for it never belonged to him, but is a mere gratuity given by law to thoſe whom it is preſumed the deceaſed could not ſufficiently provide; and law has given it expreſsly to *executors*: And if it were to be governed by the rules of ſucceſſion in executory, the widow, in caſe of no children, would get one half, the other would go to the next of kin; and where there are children, ſhe would be intitled to a third, and the other two thirds would fall equally among the children. But the court of Seſſion, probably led by the general practice, have in this laſt caſe divided the ann into two equal parts, of which one goes to the widow, and the other among the children *in capita*.

22. From the great confidence that was, in the firſt ages of Chriſtianity, repoſed in churchmen, dying perſons frequently committed to them the care of their eſtates, and of their orphan children: but theſe were ſimply rights of truſt, not of juriſdiction. The clergy ſoon had the addreſs to eſtabliſh to themſelves a proper juriſdiction, not confined to points of eccleſiaſtical right, but extending to queſtions that had no concern with the church. They judged, not only in teinds, patronages, teſtaments, breach of vow, ſcandal, *&c.*; but in queſtions of marriage and divorce, becauſe marriage was a ſacrament; in tochers, becauſe theſe were given in conſideration of marriage; in all queſtions where an oath intervened, on pretence that oaths were a part of religious worſhip, *&c.* As churchmen came, by the means of this extenſive juriſdiction, to be diverted from their proper functions, they committed the exerciſe of it to their officials or commiſſaries: Hence the Commiſſary-court was called the Biſhops court, and *Curia Chriſtianitatis*; it is alſo ſtyled the Conſiſtorial Court, from *Conſiſtory*, a name firſt given to the court of appeals of the Roman Emperors and afterwards to the courts of judicature held by churchmen.

23. At the reformation, all epiſcopal juriſdiction, exerciſed under the authority of the Biſhop of Rome, was aboliſhed. As the courſe of juſtice in conſiſtorial cauſes was thereby ſtopped, Q. Mary, beſides naming a Commiſſary for every dioceſe, did, by a ſpecial grant, eſtabliſh a new Commiſſary-court at Edinburgh, conſiſting of four judges or commiſſaries. This court is veſted with a double juriſdiction; one dioceſan, which is exerciſed in the ſpecial territory contained in the grant, *viz.* the counties of Edinburgh, Haddington, Linlithgow, Peebles, and a part part of Stirling-ſhire; and another univerſal, by which the judges confirm the teſtaments of all who die in foreign parts, and may reduce the decrees of all inferior Commiſſaries, provided the reduction be purſued within a year after the decree: Biſhops, upon their re-eſtabliſhment in the reign of James VI. were reſtored to the right of naming their ſeveral Commiſſaries.

24. As the clergy, in times of Popery, aſſumed a juriſdiction independent of the civil power or any ſecular court, their ſentences could be reviewed only by the Pope, or judges delegated by him; ſo that, with regard to the courts of Scotland, their juriſdiction was ſupreme. But by an act 1560, the appeals from our Biſhops courts, that were then depending before the Roman conſiſtories, were ordained to be decided by the court of Seſſion: And by a poſterior act 1609, the Seſſion is declared the King's great Conſiſtory, with power to review all ſentences pronounced by the Commiſſaries. Nevertheleſs, ſince that court had no inherent juriſdiction in conſiſtorial cauſes, prior to this ſtatute; and ſince the ſtatute gives them a power of judging only by way of advocation, they have not, to this day, any proper conſiſtorial juriſdiction in the firſt inſtance: neither do they pronounce ſentence, in any conſiſtorial cauſe brought from the Commiſſaries, but remit it back to them with inſtructions. By the practice immediately ſubſequent to the act before quoted, they did not admit advocations from the inferior Commiſſaries, till the cauſe was brought before the Commiſſaries of Edinburgh; but that practice is now in diſuſe.

25. The Commiſſaries retain to this day an excluſive power of judging in declarators of marriage, and of the nullity of marriage; in actions of divorce and of non-adherence, of adultery, baſtardy, and confirmation of teſtaments; becauſe all theſe matters are ſtill conſidered to be properly conſiſtorial. Inferior Commiſſaries are not competent to queſtions of divorce, under which are comprehended queſtions of baſtardy and adherence, when they have a connection with the lawfulneſs of marriage, or with adultery.

26. Commiſſaries have now no power to pronounce decrees in abſence for any ſum above L. 40 Scots, except in cauſes properly conſiſtorial: but they may authenticate tutorial and curatorial inventories; and all bonds, contracts, *&c.* which contain a clauſe for regiſtration in the books of any judge competent, and proteſts on bills, may be regiſtred in their books.

Tit. 6. *Of Marriage.*

PERSONS, when conſidered in a private capacity, are chiefly diſtinguiſhed by their mutual relations; as huſband and wife, tutor and minor, father and child, maſter and ſervant. The relation of huſband and wife is conſtituted by marriage; which is the conjunction of man and wife, vowing to live inſeparably till death.

2. Marriage is truly a contract, and ſo requires the conſent of parties. Ideots, therefore, and furious perſons cannot marry. As no perſon is preſumed capable of conſent within the years of pupillarity, which, by our law, laſts till the age of fourteen in males, and twelve in females, marriage cannot be contracted by pupils; but if the married pair ſhould cohabit after puberty, ſuch acquieſcence

acquiescence gives force to the marriage. Marriage is fully perfected by consent; which, without consummation, founds all the conjugal rights and duties. The consent requisite to marriage must be *de præsenti*. A promise of marriage, (*stipulatio sponsalitia*,) may be resiled from, as long as matters are entire; but if any thing be done by one of the parties, whereby a prejudice arises from the non-performance, the party resiling is liable in damages to the other. The canonists, and after them our courts of justice, explain a *copula* subsequent to a promise of marriage into actual marriage.

3. It is not necessary, that marriage should be celebrated by a clergymen. The consent of parties may be declared before any magistrate, or simply before witnesses: And though no formal consent should appear, marriage is presumed from the cohabitation, or living together at bed and board, of a man and woman who are generally reputed husband and wife. One's acknowledgment of his marriage to the midwife whom he called to his wife, and to the minister who baptized his child, was found sufficient presumptive evidence of marriage, without the aid, either of cohabitation, or of *habite and repute*. The father's consent was, by the Roman law, essential to the marriage of children *in familia*: But, by our law, children may enter into marriage, without the knowledge, and even against the remonstrances of a father.

4. Marriage is forbidden within certain degrees of blood. By the law of Moses, *Levit. c.* 18. which is made ours, seconds in blood, and all remoter degrees, may lawfully marry. By seconds in blood are meant first cousins. Marriage in the direct line is forbidden *in infinitum*; as it is also in the collateral line, in the special case where one of the parties is *loco parentis* to the other, as grand uncle, great grand-uncle, *&c.* with respect to his grand-niece, *&c.* The same degrees that are prohibited in consanguinity, are prohibited in affinity; which is the tie rising from marriage, betwixt one of the married pair and the blood-relations of the other. Marriage also, where either of the parties is naturally unfit for generation, or stands already married to a third person, is *ipso jure* null.

5. To prevent bigamy and incestuous marriages, the church has introduced proclamation of banns; which is the ceremony of publishing the names and designations of those who intend to intermarry, in the churches where the bride and bridegroom reside, after the congregation is assembled for divine service; that all persons who know any objection to the marriage, may offer it. When the order of the church is observed, the marriage is called regular; when otherwise, clandestine.

6. By marriage, a society is created between the married pair, which draws after it a mutual communication of their civil interests, in as far as is necessary for maintaining it. As the society lasts only for the joint lives of the *socii*; therefore rights that have the nature of a perpetuity, which our law styles heritable, are not brought under the partnership or communion of goods; as a land-estate, or bonds bearing a yearly interest: It is only moveable subjects, or the fruits produced by heritable subjects during the marriage, that become common to man and wife.

7. The husband, as the head of the wife, has the sole right of managing the goods in communion, which is called *jus mariti*. This right is so absolute, that it bears but little resemblance to a right of administring a common subject; for the husband can, in virtue thereof, sell, or even gift at pleasure, the whole goods falling under communion; and his creditors may affect them for the payment of his proper debts: So that the *jus mariti* carries all the characters of an assignation by the wife to the husband, of her moveable estate. It arises *ipso jure* from the marriage; and therefore needs no other constitution. But a stranger may convey an estate to a wife, so as it shall not be subject to the husband's administration; or the husband himself may, in the marriage-contract, renounce his *jus mariti* in all or any part of his wife's moveable estate.

8. From this right are excepted paraphernal goods, which, as the word is understood in our law, comprehends the wife's wearing apparel, and the ornaments proper to her person, as necklaces, ear-rings, breast or arm jewels, buckles, &c. These are neither alienable by the husband, nor affectable by his creditors. Things of promiscuous use to husband and wife, as plate, medals, &c. may become paraphernal, by the husband's giving them to the wife, at or before marriage; but they are paraphernal only in regard to that husband who gave them as such, and are esteemed common moveables, if the wife, whose *paraphernalia* they were, be afterwards married to a second husband; unless he shall in the same manner appropriate them to her.

9. The right of the husband to the wife's moveable estate, is burdened with the moveable debts contracted by her before marriage: And as his right is universal, so is his burden; for it reaches to her whole moveable debts, though they should far exceed her moveable estate. Yet the husband is not considered as the true debtor in his wife's debts. In all actions for payment, she is the proper defender: the husband is only cited for his interest, that is, as curator to her, and administrator of the society-goods. As soon therefore as the marriage is dissolved, and the society goods thereby suffer a division, the husband is no farther concerned in the share belonging to his deceased wife; and consequently is no longer liable to pay her debts, which must be recovered from her representatives, or her separate estate.

10. This obligation upon the husband is perpetuated against him 1. Where his proper estate, real or personal, has been affected, during the marriage, by complete legal diligence; in which case, the husband must, by the common rules of law, relieve his property from the burden with which it stands charged: But the utmost diligence against his person, is not sufficient to perpetuate the obligation; nor even incomplete diligence against his estate. 2. The husband continues liable. even after the wife's death, in so far as he is *lucratus* or profited by her estate. As he was at no time the proper debtor in his wife's moveable debts; therefore, though he should be *lucratus*, he is, after the dissolution, only liable for them

them *subsidiarie*, i. e. if her own separate estate is not sufficient to pay them off.

11. Where the wife is debtor in that sort of debt, which, if it had been due to her, would have excluded the *jus mariti*, *e. g.* in bonds bearing interest, the husband is liable only for the bygone interests, and those that may grow upon the debt during the marriage; because his obligations for her debts must be commensurated to the interest he has in her estate. It is the husband alone who is liable in personal diligence for his wife's debts, while the marriage subsists: The wife, who is the proper debtor, is free from all personal execution upon them while she is *vestita viro*.

12. The husband by marriage becomes the perpetual curator of the wife. From this right it arises, 1. That no suit can proceed against the wife, till the husband be cited for his interest. 2. All deeds, done by a wife without the husband's consent, are null; neither can she sue in any action without the husband's concurrence. Where the husband refuses, or by reason of forfeiture, *&c.* cannot concur; or where the action is to be brought against the husband himself, for performing his part of the marriage articles; the judge will authorise her to sue in her own name. The effects arising from this curatorial power discover themselves even before marriage, upon the publication of banns; after which the bride, being no longer *sui juris*, can contract no debt, nor do any deed, either to the prejudice of her future husband, nor even to her own.

13. If the husband should either withdraw from his wife, or turn her out of doors; or if, continuing in family with her, he should by severe treatment endanger her life; the Commissaries will authorise a separation *a mensa et toro*, and give a separate alimony to the wife, suitable to her husband's estate, from the time of such separation, until either a reconciliation or a sentence of divorce.

14. Certain obligations of the wife are valid, notwithstanding her being *sub cura mariti*; *ex. gr.* obligations arising from delict; for wives have no privilege to commit crimes. But if the punishment resolves into a pecuniary mulct, the execution of it must, from her incapacity to fulfil, be suspended till the dissolution of the marriage, unless the wife has a separate estate exempted from the *jus mariti*.

15. Obligations arising from contract, affect either the person or the estate. The law has been so careful to protect wives, while *sub cura mariti*, that all personal obligations granted by a wife, though with the husband's consent, as bonds, bills, *&c.* are null; with the following exceptions: 1. Where the wife gets a separate *peculium* or stock, either from her father or a stranger, for her own or her children's alimony, she may grant personal obligations in relation to such stock; and by stronger reason, personal obligations granted by a wife are good, when her person is actually withdrawn from her husband's power, by a judicial separation. 2. A wife's personal obligation, granted in the form of a deed *inter vivos*, is valid, if it is not to take effect till her death. 3. Where the wife is by the husband *præposita negotiis*, entrusted with the management, either of a particular branch of business, or of his whole affairs, all the contracts she enters into in the exercise of her *præpositura*, are effectual, even though they be not reduced to writing, but should arise merely *ex re*, from furnishings made to her: But such obligations have no force against the wife; it is the husband only, by whose commission she acts, who is thereby obliged.

16. A wife, while she remains in family with her husband, is considered as *præposita negotiis domesticis*; and consequently may provide things proper for the family, for the price whereof the husband is liable, though they should be misapplied, or though the husband should have given her money to provide them elsewhere. A husband, who suspects that his wife may hurt his fortune by high living, may use the remedy of inhibition against her; by which all persons are interpelled from contracting with her, or giving her credit. After the completing of this diligence, whereby the *præpositura* falls, the wife cannot bind the husband, unless for such reasonable furnishings as he cannot instruct that he provided her with *aliunde*. As every man, and consequently every husband, has a right to remove his managers at pleasure, inhibition may pass at the suit of the husband against the wife, though he should not offer to justify that measure by an actual proof of the extravagance or profuseness of her temper.

17. As to rights granted by the wife affecting her estate; she has no moveable estate, except her *paraphernalia*; and these she may alien or impignorate, with consent of the husband. She can, without the husband, bequeath by testament her share of the goods in communion; but she cannot dispose of them *inter vivos*. A wife can lawfully oblige herself, in relation to her heritable estate, with consent of her husband; for though her person is in some sense sunk by the marriage, she continues capable of holding a real estate; and in such obligations, her estate is considered, and not her person. A husband, though he be curator to his wife, can, by his acceptance or intervention, authorise rights granted by her in his own favour: for a husband's curatory is not intended only for the wife's advantage, but is considered as a mutual benefit to both.

18. All donations, whether by the wife to the husband, or by the husband to the wife, are revocable by the donor; but if the donor dies without revocation, the right becomes absolute. Where the donation is not pure, it is not subject to revocation: Thus, a grant made by the husband, in consequence of the natural obligation that lies upon him to provide for his wife, is not revocable, unless in so far as it exceeds the measure of a rational settlment; neither are remuneratory grants revocable, where mutual grants are made in consideration of each other, except where an onerous cause is simulated, or where what is given *hinc inde* bears no proportion to each other. All voluntary contracts of separation, by which the wife is provided in an yearly alimony, are effectual as to the time past, but revocable either by the husband or wife.

19. As wives are in the strongest degree subject to the influence of their husbanda, third parties, in whose favours they had made grants, were frequently vexed with actions of reduction, as if the grant had been extorted from the wife, through the force or fear of the husband.

husband. To secure the grantees against this danger, ratifications were introduced, whereby the wife, appearing before a judge, declares upon oath, her husband not present, that she was not induced to grant the deed *ex vi aut metu*. A wife's ratification is not absolutely necessary for securing the grantee: Law indeed allows the wife to bring reduction of any deed she has not ratified, upon the head of force or fear; of which, if she brings sufficient evidence, the deed will be set aside; but if she fails in the proof, it will remain effectual to the receiver.

20. Marriage, like other contracts, might, by the Roman law, be dissolved by the contrary consent of parties; but, by the law of Scotland, it cannot be dissolved till death, except by divorce, proceeding either upon the head of adultery, or of wilful desertion.

21. Marriage is dissolved by death, either within year and day from its being contracted, or after year and day. If it is dissolved within year and day, all rights granted in consideration of the marriage (unless guarded against in the contract) become void, and things return to the same condition in which they stood before the marriage; with this restriction, that the husband is considered as a *bona fide* possessor, in relation to what he has consumed upon the faith of his right; but he is liable to repay the tocher, without any deduction in consideration of his family expence during the marriage. If things cannot be restored on both sides, equity hinders the restoring of one party, and not the other.

22. Upon the dissolution of a marriage, after year and day, the surviving husband becomes the irrevocable proprietor of the tocher and the wife, where she survives, is intitled to her jointure, or to her legal provisions. She has also right to mournings, suitable to the husband's quality; and to alimony from the day of his death, till the term at which her liferent provision, either legal or conventional, commences. If a living child be procreated of the marriage, the marriage has the same effect as if it had subsisted beyond the year. A day is adjected to the year, *in majorem evidentiam*, that it may clearly appear that the year itself is elapsed; and therefore, the running of any part of the day, after the year, has the same effect as if the whole were elapsed. The legal right of courtesy competent to the surviving husband is explained below, Tit. xvi 28.

23. Divorce is such a separation of married persons, during their lives, as looses them from the nuptial tie, and leaves them at freedom to intermarry with others. But neither adultery, nor wilful desertion, are grounds which must necessarily dissolve marriage; they are only handles, which the injured party may take hold of, to be free. Cohabitation, therefore, by the injured party, after being in the knowledge of the acts of adultery, implies a passing from the injury; and no divorce can proceed, which is carried on by collusion betwixt the parties, lest, contrary to the first institution of marriage, they might disengage themselves by their own consent: and though after divorce, the guilty person, as well as the innocent, may contract second marriages; yet in the case of divorce upon adultery, marriage is by special statute prohibited betwixt the two adulterers.

24. Where either party has deserted from the other for four years together, that other may sue for adherence. If this has no effect, the church is to proceed, first by admonition, then by excommunication; all which previous steps are declared to be a sufficient ground for pursuing a divorce. *De praxi*, the Commissaries pronounce sentence in the adherence, after one year's desertion; but four years must intervene between the first desertion and the decree of divorce.

25. The legal effects of divorce on the head of desertion are, that the offending husband shall restore the tocher, and forfeit to the wife all her provisions, legal and conventional; and on the other hand, the offending wife shall forfeit to the husband her tocher, and all the rights that would have belonged to her, in the case of her survivance. This was also esteemed the rule in divorces upon adultery. But by a decision of the court of Session 1762, founded on a tract of ancient decisions recovered from the records, the offending husband was allowed to retain the tocher.

Tit. 7. *Of Minors, and their Tutors and Curators.*

1. The stages of life principally distinguished in law are, *pupillarity*, *puberty* or *minority*, and *majority*. A child is under pupillarity, from the birth till fourteen years of age, if a male, and till twelve, if a female. Minority begins where pupillarity ends, and continues till majority, which, by the law of Scotland, is the age of twenty-one years complete, both in males and females: But minority, in a large sense, includes all under age, whether pupils, or *puberes*. Because pupils cannot in any degree act for themselves, and minors seldom with discretion, pupils are put by law under the power of tutors, and minors may put themselves under the direction of curators. Tutory is a power and faculty to govern the person, and administer the estate of a pupil. Tutors are either nominate, of law, or dative

2. A tutor nominate is he who is named by a father, in his testament or other writing, to a lawful child. Such tutor is not obliged to give caution for the faithful discharge of his office; because his fidelity is presumed to have been sufficiently known to the father.

3. If there be no nomination by the father, or if the tutors nominate do not accept, or if the nomination falls by death or otherwise, there is place for a tutor of law. This sort of tutory devolves upon the next agnate; by which we understand he who is nearest related by the father, though females intervene.

4. Where there are two or more agnates equally near to the pupil, he who is intitled to the pupil's legal succession falls to be preferred to the others. But as the law suspects, that he may not be over careful to preserve a life which stands in the way of his own interest, this sort of tutor is excluded from the custody of the pupil's person, which is commonly committed to the mother, while a widow, until the pupil be seven years old; and, in default of the mother, to the next cognate, *i. e.* the nighest relation by the mother. The tutor of law must be at least twenty-five years of age. He is served or declared by a jury of sworn men, who are called upon a brief issuing

ing from the Chancery, which is directed to any judge having jurisdiction. He must give security before he enters upon the management.

5. If no tutor of law demands the office, any person, even a stranger, may apply for a tutory-dative. But because a tutor in law ought to be allowed a competent time to deliberate whether he will serve or not, no tutory-dative can be given till the elapsing of a year from the time at which the tutor of law had first a right to serve. It is the king alone, as the father of his country, who gives tutors-dative, by his court of exchequer; and no gift of tutory can pass in exchequer, without the citation or consent of the next of kin to the pupil, both by the father and mother, nor till the tutor give security, recorded in the books of exchequer. There is no room for a tutor of law, or tutor dative, while a tutor nominate can be hoped for: and tutors of law, or dative, even after they have begun to act, may be excluded by the tutor nominate, as soon as he offers to accept, unless he has expressly renounced the office. If a pupil be without tutors of any kind, the court of Session will, at the suit of any kinsman, name a factor (steward) for the management of the pupil's estate.

6. After the years of pupillarity are over, the minor is considered as capable of acting by himself, if he has confidence enough of his own capacity and prudence. The only two cases in which curators are imposed upon minors are, first, where they are named by the father, in a state of health. 2. Where the father is himself alive; for a father is *ipso jure*, without any service, administrator, that is, both tutor and curator of law to his children, in relation to whatever estate may fall to them during their minority. This right in the father does not extend to grand-children, nor to such even of his immediate children as are forisfamiliated. Neither has it place in subjects which are left by a stranger to the minor, exclusive of the father's administration. If the minor chuses to be under the direction of curators, he must raise and execute a summons, citing at least two of his next of kin, to appear before his own judge-ordinary, upon nine days warning. At the day and place of appearance, he offers to the judge a list of those whom he intends for his curators: such of them as resolve to undertake the office, must sign their acceptance, and give caution; upon which an act of curatory is extracted.

7. These curators are styled *ad negotia*, to distinguish them from another sort called curators *ad lites*, who are authorised by the judge to concur with a pupil or minor in actions of law, either where he is without tutors and curators, or where his tutors or curators are parties to the suit. This sort is not obliged to give caution, because they have no intermeddling with the minor's estate: they are appointed for a special purpose; and when that is over, their office is at an end. Women are capable of being tutors and curators, under the following restrictions; 1. The office of a female tutor or curator falls by her marriage, even though the nomination should provide otherwise; 2. No woman can be tutor of law. Papists are declared incapable of tutory or curatory. Where the minor has more tutors and curators than one, who are called in the nomination to the joint management, they must all concur in every act of administration: where a certain number is named for a quorum, that number must concur: where any one is named *sine quo non*, no act is valid without that one's special concurrence. But if they are named without any of these limitations, the concurrence of the majority of the nominees then alive is sufficient.

8. In this, tutory differs from curatory, that as pupils are incapable of consent, they have no person capable of acting; which defect the tutor supplies: but a minor *pubes* can act for himself. Hence, the tutor subscribes alone all deeds of administration: but in curatory, it is the minor who subscribes as the proper party; the curator does no more than consent. Hence also, the persons of pupils are under the power, either of their tutors or of their nearest cognates; but the minor, after pupillarity, has the disposal of his own person, and may reside where he pleases. In most other particulars, the nature, the powers, and the duties of the two offices coincide. Both tutors and curators must, previous to their administration, make a judicial inventory, subscribed by them and the next of kin, before the minor's judge-ordinary, of his whole estate, personal and real; of which, one subscribed duplicate is to be kept by the tutors or curators themselves; another, by the next of kin on the father's side; and a third, by the next of kin on the mother's. If any estate belonging to the minor shall afterwards come to their knowledge, they must add it to the inventory within two months after their attaining possession thereof. Should they neglect this, the minor's debtors are not obliged to make payment to them; they may be removed from their offices as suspected, and they are intitled to no allowance for the sums disbursed by them in the minor's affairs, except the expence laid out upon the minor's entertainment, upon his lands and houses, and upon completing his titles.

9. Tutors and curators cannot grant leases of the minor's lands, to endure longer than their own office; nor under the former rental, without either a warrant from the court of Session, or some apparent necessity.

10. They have power to sell the minor's moveables; but cannot sell their pupil's land estate, without the authority of a judge. But the alienation of heritage by a minor, with consent of his curators, is valid.

11. Tutors and curators cannot, contrary to the nature of their trust, authorise the minor to do any deed for their own benefit; nor can they acquire any debt affecting the minor's estate: and, where a tutor or curator makes such acquisition, in his own name, for a less sum than the right is intitled to draw, the benefit thereof accrues to the minor.

12. By the Roman law, tutory and curatory, being *munera publica*, might be forced upon every one who had not a relevant ground of excuse; but, with us, the persons named to these offices may either accept or decline: and where a father, in *liege poustie*, names certain persons both as tutors and curators to his children, though they have acted as tutors, they may decline the office of curatory. Tutors and curators having once accepted, are liable *in diligence*, that is, are accountable for the consequences of their neglect in any part of their duty

duty from the time of their acceptance. They are accountable *ſinguli in ſolidum*; i. e. every one of them is anſwerable, not only for his own diligence, but for that of his co-tutors; and any one may be ſued without citing the reſt: But he who is condemned in the whole, has action of relief againſt his co-tutors.

13 From this obligation to diligence, we may except, 1. Fathers or adminiſtrators in law, who, from the preſumption that they act to the beſt of their power for their children, are liable only for actual intromiſſions. 2. Tutors and curators named by the father, with the ſpecial proviſos, that they ſhall be liable barely for intromiſſions, not for omiſſions; and that each of them ſhall be liable only for himſelf, and not *in ſolidum* for the co-tutors: But this power of exemption from diligence, is limited to the eſtate deſcending from the father himſelf. Tutors or curators are not intitled to any ſalary or allowance for pains, unleſs a ſalary has been expreſsly contained in the teſtator's nomination; for their office is preſumed gratuitous.

14. Though no perſon is obliged to accept the office of tutor or curator, yet having once accepted, he cannot throw it up or renounce it, without ſufficient cauſe; but, if he ſhould be guilty of miſapplying the minor's money, or fail in any other part of his duty, he may be removed at the ſuit of the minor's next in kin, or by a co-tutor, or co-curator. Where the miſconduct proceeds merely from indolence, or inattention, the court, in place of removing the tutor, either join a curator with him, or, if he be a tutor-nominate, they oblige him to give caution for his paſt and future management.

15 The offices of tutory and curatory expire by the pupil's attaining the age of puberty, or the minor's attaining the age of twenty-one years complete; and by the death either of the minor, or of his tutor or curator.

16. Deeds either by pupils, or by minors having curators without their conſent, are null; but they oblige the granters, in as far as relates to ſums profitably applied to their uſe. A minor under curators can indeed make a teſtament by himſelf; but whatever is executed in the form of a deed *inter vivos*, requires the curator's conſent. Deeds by a minor who has no curators, are as effectual as if he had curators, and ſigned them with their conſent; he may even alien his heritage, without the interpoſition of a judge.

17. Minors may be reſtored againſt all deeds granted in their minority, that are hurtful to them. Deeds, in themſelves void, need not the remedy of reſtitution; but where hurtful deeds are granted by a tutor in his pupil's affairs, or by a minor who has no curators, as theſe deeds ſubſiſt in law, reſtitution is neceſſary: And even where a minor, having curators, executes a deed hurtful to himſelf with their conſent, he has not only action againſt the curators, but he has the benefit of reſtitution againſt the deed itſelf. The minor cannot be reſtored, if he does not raiſe and execute a ſummons for reducing the deed, *ex capite minorennitatis et læſionis*, before he be twenty-five years old. Theſe four years, between the age of twenty-one and twenty-five, called *quadriennium utile*, are indulged to the minor, that he may have a reaſonable time, from that period, when he is firſt preſumed to have the perfect uſe of his reaſon, to conſider with himſelf what deeds done in his minority have been truly prejudicial to him.

18. Queſtions of reſtitution are proper to the court of Seſſion. Two things muſt be proved by the minor, in order to the reduction of the deed; 1. That he was minor when it was ſigned; 2. That he is hurt or leſed by the deed. This leſion muſt not proceed merely from accident; for the privilege of reſtitution was not intended to exempt minors from the common misfortunes of life; it muſt be owing to the imprudence or negligence of the minor, or his curator.

19 A minor cannot be reſtored againſt his own delict or fraud. 2. Reſtitution is excluded, if the minor, at any time after majority, has approved of the deed, either by a formal ratification, or tacitly by payment of intereſt, or by other acts inferring approbation. 3. A minor, who has taken himſelf to buſineſs, as a merchant ſhopkeeper, *&c* cannot be reſtored againſt any deed granted by him, in the courſe of that buſineſs, eſpecially if he was *proximus majorennitati* at ſigning the deed. 4. According to the more common opinion, a minor cannot be reſtored in a queſtion againſt a minor, unleſs ſome groſs unfairneſs ſhall be qualified in the bargain.

20. The privilege of reſtitution does not always die with the minor himſelf. 1 If a minor ſucceeds to a minor, the time allowed for reſtitution is governed by the minority of the heir, not of the anceſtor. 2. If a minor ſucceeds to a major, who was not full twenty-five, the privilege continues with the heir during his minority; but he cannot avail himſelf of the *anni utiles*, except in ſo far as they were unexpired at the anceſtor's death. 3. If a major ſucceeds to a minor, he has only the *quadriennium utile* after the minor's death; and if he ſucceeds to a major dying within the *quadriennium*, no more of it can be profitable to him than what remained when the anceſtor died,

21. No minor can be compelled to ſtate himſelf as a defender, in any action, whereby his heritable eſtate flowing from aſcendants may be evicted from him, by one pretending a preferable right.

22 This privilege is intended merely to ſave minors from the neceſſity of diſputing upon queſtions of preference; it does not therefore take place, 1. Where the action is purſued on the father's falſhood or delict. 2. Upon his obligation to convey heritage. 3. On his liquid bond for a ſum of money, though ſuch action ſhould have the effect to carry off the minor's eſtate by adjudication 4. Nor in actions purſued by the minor's ſuperior, upon feudal caſualties. 5. This privilege cannot be pleaded in bar of an action which had been firſt brought againſt the father and is only continued againſt the minor; nor where the father was not in the peaceable poſſeſſion of the heritable ſubject at his death Before the minor can plead it, he muſt be ſerved heir to his father. The perſons of pupils are protected from impriſonment on civil debts.

23. Curators are given, not only to minors, but in general to every one who, either through defect of judgment, or unfitneſs of diſpoſition, is incapable of rightly

rightly managing his own affairs. Of the first sort, are idiots and furious persons. Idiots, or *fatui*, are entirely deprived of the faculty of reason. The distemper of the furious person does not consist in the defect of reason, but in an overheated imagination, which obstructs the application of reason to the purposes of life. Curators may be also granted to lunatics, and even to persons dumb and deaf, though they are of sound judgment, where it appears that they cannot exert it in the management of business. Every person, who is come of age, and is capable of acting rationally, has a natural right to conduct his own affairs. The only regular way, therefore, of appointing this sort of curators, is by a jury summoned upon a brief from the chancery; which is not, like the brief of common tutory, directed to any judge-ordinary, but to the judge of the special territory where the person alledged to be fatuous or furious resides; that if he is truly of sound judgment, he may have an opportunity to oppose it: And, for this reason, he ought to be made a party to the brief. The curatory of idiots and furious persons belongs to the nearest agnate; but a father is preferred to the curatory of his fatuous son, and the husband to that of his fatuous wife, before the agnate.

24. A clause is inserted in the brief, for inquiring how long the fatuous or furious person has been in that condition; and the verdict to be pronounced by the inquest, is declared a sufficient ground, without farther evidence, for reducing all deeds granted after the period at which it appeared by the proof that the fatuity or furiosity began. But, as fatuous and furious persons are, by their very state, incapable of being obliged, all deeds done by them may be declared void, upon proper evidence of their fatuity at the time of signing, though they should never have been cognosced idiots by an inquest.

25. We have some few instances of the Sovereign's giving curators to idiots, where the next agnate did not claim; but such gifts are truly deviations from our law, since they pass without an inquiry into the state of the person upon whom the curatory is imposed. Hence the curator of law to an idiot, serving *quandocunque*, is preferred as soon as he offers himself, before the curator-dative. This sort of curatory does not determine by the lucid intervals of the person *sub cura*; but it expires by his death, or perfect return to a sound judgment; which last ought regularly to be declared by the sentence of a judge.

26. Persons, let them be ever so profuse, or liable to be imposed upon, if they have the exercise of reason, can effectually oblige themselves, till they are fettered by law. Interdiction is a legal restraint laid upon such persons from signing any deed to their own prejudice, without the consent of their curators or interdictors.

27. There could be no interdiction, by our ancient practice, without a previous inquiry into the person's condition. But as there were few who could bear the shame that attends judicial interdiction, however necessary the restraint might have been, voluntary interdiction has received the countenance of law; which is generally executed in the form of a bond, whereby the granter obliges himself to do no deed that may affect his estate, without the consent of certain friends therein mentioned. Though the reasons inductive of the bond should be but gently touched in the recital, the interdiction stands good. Voluntary interdiction, though it be imposed by the sole act of the person interdicted, cannot be recalled at his pleasure: But it may be taken off, 1. By a sentence of the court of Session, declaring, either that there was, from the beginning, no sufficient ground for the restraint; or that the party is, since the date of the bond, become *rei suæ providus*. 2. It falls, even without the authority of the Lords, by the joint act of the person interdicted, and his interdictors, concurring to take it off 3. Where the bond of interdiction requires a certain number as a quorum, the restraint ceases, if the interdictors shall be by death reduced to a lesser number.

28. Judicial interdiction is imposed by a sentence of the court of Session. It commonly proceeds on an action brought by a near kinsmen to the party; and sometimes from the *nobile officium* of the court, when they perceive, during the pendency of a suit, that any of the litigants is, from the facility of his temper, subject to imposition. This sort must be taken off by the authority of the same court that imposed it.

29. An interdiction need not be served against the person interdicted; but it must be executed, or published by a messenger, at the market-cross of the jurisdiction where he resides, by publicly reading the interdiction there, after three oyesses made for convocating the lieges. A copy of this execution must be affixed to the cross; and thereafter, the interdiction, with its execution, must be registred in the books, both of the jurisdiction where the person interdicted resides, and where his lands lie, or in the general register of the session, within forty days from the publication. An interdiction, before it is registred, has no effect against third parties, though they should be in the private knowledge of it; but it operates against the interdictors themselves, as soon as it is delivered to them.

30. An interdiction, duly registred, has this effect, that all deeds, done thereafter, by the person interdicted, without the consent of his interdictors, affecting his heritable estate, are subject to reduction. Registration, in the general register, secures all his lands from alienation, where-ever they lie; but where the interdiction is recorded in the register of a particular shire, it covers no lands, except those situated in that shire. But persons interdicted have full power to dispose of their moveables, not only by testament, but by present deeds of alienation: And creditors, in personal bonds granted after interdiction, may use all execution against their debtor's person and moveable estate; such bonds being only subject to reduction, in so far as diligence against the heritable estate may proceed upon them.

31. All onerous or rational deeds granted by the person interdicted, are as effectual, even without the consent of the interdictor, as if the granter had been laid under no restraint; but he cannot alter the succession of his heritable estate, by any settlement, let it be ever so rational. No deed, granted with consent of the interdictors, is reducible, though the strongest lesion or prejudice to the granter should appear: The only remedy competent, in such case, is an action by the granter against his interdictors,

tors, for making up to him what he has loſt through their undue conſent. It is no part of the duty of interdictors, to receive ſums, or manage any eſtate; they are given merely *ad auctoritatem præſtandam*, to interpoſe their authority to reaſonable deeds; and ſo are accountable for nothing but their fraud or fault, in conſenting to deeds hurtful to the perſon under their care.

32. The law concerning the ſtate of children falls next to be explained. Children are either born in wedlock, or out of it. All children, born in lawful marriage or wedlock, are preſumed to be begotten by the perſon to whom the mother is married; and conſequently to be lawful children. This preſumption is ſo ſtrongly founded, that it cannot be defeated but by direct evidence that the mother's huſband could not be the father of the child, *e.g.* where he is impotent, or was abſent from the wife till within ſix lunar months of the birth. The canoniſts indeed maintain, that the concurring teſtimony of the huſband and wife that the child was not procreated by the huſband, is ſufficient to elide this legal preſumption for legitimacy: but it is an agreed point, that no regard is to be paid to ſuch teſtimony, if it be made after they have owned the child to be theirs. A father has the abſolute right of diſpoſing of his childrens perſon, of directing their education, and of moderate chaſtiſement; and even after they become *puberes*, he may compel them to live in family with him, and to contribute their labour and induſtry, while they continue there, towards his ſervice. A child who gets a ſeparate ſtock from the father for carrying on any trade or employment, even though he ſhould continue in the father's houſe, may be ſaid to be emancipated or foriſfamiliated, in ſo far as concerns that ſtock; for the profits ariſing from it are his own. Foriſfamiliation, when taken in this ſenſe, is alſo inferred by the child's marriage, or by his living in a ſeparate houſe, with his father's permiſſion or goodwill. Children, after their full age of twenty-one years, become, according to the general opinion, their own maſters; and from that period are bound to the father only by the natural ties of duty, affection, and gratitude. The mutual obligations between parents and children to maintain each other, are explained afterwards, Tit. 20.

33. Children, born out of wedlock, are ſtyled natural children, or baſtards. Baſtards may be legitimated or made lawful, either, 1. By the ſubſequent intermarriage of the mother of the child with the father. And this ſort of legitimation, intitles the child to all the rights of lawful children. The ſubſequent marriage, which produces legitimation, is conſidered by the law to have been entered into when the child legitimated was begotten; and hence, if he be a male he excludes, by his right of primogeniture, the ſons procreated after the marriage, from the ſucceſſion of the father's heritage, though theſe ſons were lawful children from the birth. Hence alſo, thoſe children only can be thus legitimated, who are begotten of a woman whom the father might at that period have lawfully married. 2. Baſtards are legitimated by letters of legitimation from the ſovereign. See Tit. 29.

34. As to the power of maſters over their ſervants: All ſervants now enjoy the ſame rights and privileges with other ſubjects, unleſs in ſo far as they are tied down by their engagements of ſervice. Servants are either neceſſary or voluntary. Neceſſary are thoſe whom law obliges to work without wages, of whom immediately. Voluntary ſervants engage without compulſion, either for mere ſubſiſtence, or alſo for wages. Thoſe who earn their bread in this way, if they ſhould ſtand off from engaging, may be compelled to it by the Juſtices of the peace, who have power to fix the rate of their wages.

35. Colliers, coal-bearers, and ſalters, and other perſons neceſſary to collieries and ſaltworks, as they are particularly deſcribed by act 1661, are tied down to perpetual ſervice at the works to which they have once entered. Upon a ſale of the works, the right of their ſervice is transferred to the new proprietor. All perſons are prohibited to receive them into their ſervice, without a teſtimonial from their laſt maſter; and if they deſert to another work, and are redemanded within a year thereafter, he who has received them is obliged to return them within twenty-four hours, under a penalty. But though the proprietor ſhould neglect to require the deſerter within the year, he does not, by that ſhort preſcription, loſe his property in him. Colliers, *&c.* where the colliery to which they are aſtricted, is either given up, or not ſufficient for their maintenance, may lawfully engage with others; but if that work ſhall be again ſet a going, the proprietor may reclaim them back to it.

36. The poor make the loweſt claſs or order of perſons. Indigent children may be compelled to ſerve any of the king's ſubjects without wages, till their age of thirty years. Vagrants and ſturdy beggars may be alſo compelled to ſerve any manufacturer. And becauſe few perſons were willing to receive them into their ſervice, public work-houſes are ordained to be built for ſetting them to work. The poor who cannot work, muſt be maintained by the pariſhes in which they were born; and where the place of their nativity is not known, that burden falls upon the pariſhes where they have had their moſt common reſort, for the three years immediately preceeding their being apprehended, or their applying for the public charity. Where the contributions collected at the churches to which they belong, are not ſufficient for their maintenance, they are to receive badges from the miniſter and kirk ſeſſion, in virtue of which they may aſk alms at the dwelling houſes of the inhabitants of the pariſh.

Tit. 8. *Of the Diviſion of Rights, and the ſeveral ways by which a Right may be acquired.*

The things or ſubjects to which perſons have right, are the ſecond object of law. The right of enjoying and diſpoſing of a ſubject at one's pleaſure, is called property. Proprietors are reſtrained by law from uſing their property emulouſly to their neighbour's prejudice. Every ſtate or ſovereign has a power over private property, called, by ſome lawyers, *dominium eminens*, in virtue of which, the proprietor may be compelled to ſell his property for an adequate price, where an evident utility on the part of the public demands it.

2. Certain things are by nature itſelf incapable of appropriation, as the air, the light, the ocean, *&c.*; none of

of which can be brought under the power of any one perſon, though their uſe be common to all: Others are by law exempted from private commerce, in reſpect of the uſes to which they are deſtined. Of this laſt kind are, 1. *Res publicæ*, as navigable rivers, highways, bridges, *&c.*: the right of theſe is veſted in the King, chiefly for the benefit of his people, and they are called *regalia*. 2. *Res univerſitatis*, things which belong in property to a particular corporation or ſociety, and whoſe uſe is common to every individual in it; but both property and uſe are ſubject to the regulations of the ſociety; as town-houſes, corporation-halls, market-places, church yards, *&c.* The lands or other revenue belonging to a corporation do not fall under this claſs, but are *juris privati*.

3. Property may be acquired, either by occupation or acceſſion; and transferred by tradition or preſcription: But preſcription, being alſo a way of loſing property, falls to be explained under a ſeparate title. OCCUPATION, or occupancy, is the appropriating of things which have no owner, by apprehending them, or ſeizing their poſſeſſion. This was the original method of acquiring property, and continued, under certain reſtrictions, the doctrine of the Roman law, *Quod nullius eſt, fit occupantis;* but it can have no room in the feudal plan, by which the King is looked on as the original proprietor of all the lands within his dominions.

4. Even in that ſort of moveable goods which are preſumed to have once had an owner, this rule obtains by the law of Scotland, *Quod nullius eſt, fit domini regis*. Thus, the right of treaſures hid under ground, is not acquired by occupation, but accrues to the King. Thus alſo, where one finds ſtrayed cattle or other moveables, which have been loſt by the former owner, the finder acquires no right in them, but muſt give public notice thereof; and if within year and day after ſuch notice, the proprietor does not claim his goods, they fall to the King, Sheriff, or other perſon, to whom the King has made a grant of ſuch eſcheats.

5. In that ſort of moveables which never had an owner, as wild beaſts, fowls, fiſhes, or pearls found on the ſhore, the original law takes place, that he who firſt apprehends, becomes proprietor; in ſo much, that though the right of hunting, fowling, and fiſhing, be reſtrained by ſtatute, under certain penalties, yet all game, even what is catched in contravention of the law, becomes the property of the catcher, unleſs where the confiſcation thereof is made part of the penalty: But whales thrown in or killed on our coaſts, belong neither to thoſe who kill them, nor to the proprietor of the grounds on which they are caſt, but to the King, providing they are ſo large as that they cannot be drawn by a wane with ſix oxen.

6. ACCESSION is that way of acquiring property, by which, in two things which have a connection with, or dependence on one another, the property of the principal thing draws after it the property of its acceſſory. Thus the owner of a cow becomes the owner of the calf; a houſe belongs to the owner of the ground on which it ſtands, though built with materials belonging to, and at the charge of another. The Romans excepted from this rule the caſe of paintings drawn on another man's board or canvas, in conſideration of the excellency of the art; which exception our practice has for a like reaſon extended to ſimilar caſes.

7. Under acceſſion is comprehended SPECIFICATION; by which is meant, a perſon's making a new ſpecies or ſubject, from materials belonging to another. Where the new ſpecies can be again reduced to the matter of which it was made, law conſiders the former maſs as ſtill exiſting; and therefore, the new ſpecies, as an acceſſory to the former ſubject, belongs to the proprietor of that ſubject: But where the thing made cannot be ſo reduced, as in the caſe of wine, which cannot be again turned into grapes, there is no place for the *fictio juris*; and therefore the workmanſhip draws after it the property of the materials.

8. Though the new ſpecies ſhould be produced from the COMMIXTION or confuſion of different ſubſtances belonging to different proprietors, the ſame rule holds; but where the mixture is made by the common conſent of the owners, ſuch conſent makes the whole a common property, according to the ſhares that each proprietor had formerly in the ſeveral ſubjects. Where things of the ſame ſort are mixed without the conſent of the proprietors, which cannot again be ſeparated, *e. g.* two hogſheads of wine, the whole likewiſe becomes a common property; but in the after diviſion, regard ought to be had to the different quality of the wines: If the things ſo mixed admit of a ſeparation, *e. g.* two flocks of ſheep, the property continues diſtinct.

9. Property is carried from one to another by TRADITION; which is the delivery of poſſeſſion by the proprietor, with an intention to transfer the property to the receiver. Two things are therefore requiſite, in order to the tranſmitting of property in this way: 1. The intention or conſent of the former owner to transfer it on ſome proper title of alienation, as ſale, exchange, gift, *&c.* 2. The actual delivery in purſuance of that intention. The firſt is called the *cauſa*, the other the *modus transferendi dominii:* Which laſt is ſo neceſſary to the acquiring of property, that he who gets the laſt right, with the firſt tradition, is preferred, according to the rule, *Traditionibus, non nudis pactis, transferuntur rerum dominia*.

10. Tradition is either real, where the *ipſa corpora* of moveables are put into the hands of the receiver; or ſymbolical, which is uſed where the thing is incapable of real delivery, or even when actual delivery is only inconvenient. Where the poſſeſſion or cuſtody of the ſubject has been before with him to whom the property is to be transferred, there is no room for tradition.

11. Poſſeſſion, which is eſſential both to the acquiſition and enjoyment of property, is defined, the detention of a thing, with a deſign or *animus* in the detainer of holding it as his own. It cannot be acquired by the ſole act of the mind, without real detention; but. being once acquired, it may be continued *ſolo animo*. Poſſeſſion is either natural, or civil. Natural poſſeſſion is, when one poſſeſſes by himſelf: Thus, we poſſeſs lands by cultivating them and reaping their fruits, houſes by inhabiting them, moveables by detaining them in our hands. Civil poſſeſſion is our holding the thing, either by the ſole act of

of the mind, or by the hands of another who holds it in our name: Thus, the owner of a thing lent possesses it by the borrower; the proprietor of lands, by his tacksman, trustee, or steward; *&c.* The same subject cannot be possessed entirely, or *in solidum*, by two different persons at one and the same time; and therefore possession by an act of the mind ceases, as soon as the natural possession is so taken up by another, that the former possessor is not suffered to re-enter. Yet two persons may, in the judgment of law, possess the same subject, at the same time, on different rights: thus, in the case of a pledge, the creditor possesses it in his own name, in virtue of the right of impignoration; while the proprietor is considered as possessing, in and through the creditor, in so far as is necessary for supporting his right of property. The same doctrine holds in liferenters, tacksmen, and, generally, in every case where there are rights affecting a subject, distinct from the property.

12. A *bona fide* possessor is he, who, though he is not really proprietor of the subject, yet believes himself proprietor on probable grounds. A *mala fide* possessor knows, or is presumed to know, that what he possesses is the property of another. A possessor *bona fide* acquired right, by the Roman law, to the fruits of the subject possessed, that had been reaped and consumed by himself, while he believed the subjects his own. By our customs, perception alone, without consumption, secures the possessor: Nay, if he has sown the ground, while his *bona fides* continued, he is intitled to reap the crop, *propter curam et culturam*. But this doctrine does not reach to civil fruits, *e. g.* the interest of money, which the *bona fide* receiver must restore, together with the principal, to the owner.

13. *Bona fides* necessarily ceaseth by the *conscientia rei alienæ* in the possessor, whether such consciousness should proceed from legal interpellation, or private knowledge. *Mala fides* is sometimes induced, by the true owner's bringing his action against the possessor, sometimes not till litiscontestation, and, in cases uncommonly favourable, not till sentence be pronounced against the possessor.

14. The property of moveable subjects is presumed by the bare effect of possession, until the contrary be proved; but possession of an immoveable subject, though for a century of years together, if there is no seisin, does not create even a presumptive right to it: *Nulla sasina, nulla terra*. Such subject is considered as caduciary, and so accrues to the sovereign. Where the property of a subject is contested, the lawful possessor is intitled to continue his possession, till the point of right be discussed; and, if he has lost it by force or stealth, the judge will, upon summary application, immediately restore it to him.

15. Where a possessor has several rights in his person, affecting the subject possessed, the general rule is, that he may ascribe his possession to which of them he pleases; but one cannot ascribe his possession to a title other than that on which it commenced, in prejudice of him from whom his title flowed.

Tit. 9. *Of heritable and moveable Rights.*

For the better understanding the doctrine of this title, it must be known, that by the law of Scotland, and indeed of most nations of Europe, since the introduction of feus, where ever there are two or more in the same degree of consanguinity to one who dies intestate, and who are not all females, such rights belonging to the deceased as are either properly feudal, or have any resemblance to feudal rights, descend wholly to one of them, who is considered as his proper heir; the others, who have the name of next of kin or executors, must be contented with that portion of the estate which is of a more perishable nature. Hence has arisen the division of rights to be explained under this title: the subjects descending to the heir, are styled heritable; and those that fall to the next of kin, moveable.

2. All rights of, or affecting lands, under which are comprehended houses, mills, fishings, teinds; and all rights of subjects that are *fundo anexa*, whether compleated by seisin or not, are heritable *ex sua natura*. On the other hand, every thing that moves itself, or can be moved, and in general whatever is not united to land, is moveable; as household-furniture, corns, cattle, cash, arrears of rent and of interest, even though they should be due on a right of annualrent: For though the arrears last mentioned are secured on land, yet being presently payable, they are considered as cash.

3. Debts, *(nomina debitorum)*, when due by bill, promissory note, or account, are moveable. When constituted by bond, they do not all fall under any one head; but are divided into heritable and moveable, by the following rules. All debts constituted by bond bearing an obligation to infeft the creditor in any heritable subject in security of the principal sum and annualrent, or annualrent only, are heritable; for they not only carry a yearly profit, but are secured upon land.

4. Bonds merely personal, though bearing a clause of interest, are moveable as to succession; i. e. they go not to the heir, but to the next of kin or executors: but they are heritable with respect to the fisk, and to the rights of husband and wife; that is, though, by the general rule, moveable rights fall under the communion of goods consequent upon marriage, and the moveables of denounced persons fall to the crown or fisk, by single escheat, yet such bonds do neither, but are heritable in both respects

5. Bonds taken payable to heirs and assignees, secluding executors, are heritable in all respects, from the destination of the creditor. But a bond, which is made payable to heirs, without mention of executors, descends, not to the proper heir in heritage, though heirs are mentioned in the bond, but to the executor; for the word *heir*, which is a generic term, points out him who is to succeed by law in the right; and the executor, being the heir *in mobilibus*, is considered as the person to whom such bond is taken payable. But where a bond is taken to heirs male, or to a series of heirs, one after another, such bond is heritable, because its destination necessarily excludes executors.

6 Subjects originally moveable become heritable: 1. By the proprietor's destination. Thus, a jewel, or any other moveable subject, may be provided to the heir, from the right competent to every proprietor to settle his property on whom he pleases. 2. Moveable rights

rights may become heritable, by the ſupervening of an heritable ſecurity: Thus, a ſum due by a perſonal bond becomes heritable, by the creditor's accepting an heritable right for ſecuring it, or by adjudging upon it,

7. Heritable rights do not become moveable by acceſſory moveable ſecurities, the heritable right being in ſuch caſe the *jus nobilius*, which draws the other after it.

8. Certain ſubjects partake, in different reſpects, of the nature both of heritable and moveable. Perſonal bonds are moveable in reſpect of ſucceſſion, but heritable as to the fiſk, and huſband and wife. All bonds, whether merely perſonal, or even heritable, on which no ſeiſin has followed, may be affected at the ſuit of creditors, either by adjudication, which is a diligence proper to heritage; or by arreſtment, which is peculiar to moveables. Bonds ſecluding executors, though they deſcend to the creditor's heir, are payable by the debtor's executors, without relief againſt the heir; ſince the debtor's ſucceſſion cannot be affected by the deſtination of the creditor.

9. All queſtions, whether a right be heritable or moveable, muſt be determined according to the condition of the ſubject at the time of the anceſtor's death. If it was heritable at that period, it muſt belong to the heir; if moveable, it muſt fall to the executor; without regard to any alterations that may have affected the ſubject in the intermediate period between the anceſtor's death and the competition.

Tit. 10. *Of the Conſtitution of heritable Rights by Charter and Seiſin.*

Heritable rights are governed by the feudal law, which owed its origin, or at leaſt its firſt improvements, to the Longobards; whoſe kings, upon having penetrated into Italy, the better to preſerve their conqueſts, made grants to their principal commanders of great part of the conquered provinces, to be again ſubdivided by them among the lower officers, under the conditions of fidelity and military ſervice.

2. The feudal conſtitutions and uſages were firſt reduced into writing, about the year 1150, by two lawyers of Milan, under the title of *Conſuetudines Feudorum*. None of the German Emperors appear to have expreſsly confirmed this collection by their authority; but it is generally agreed, that it had their tacit approbation, and was conſidered as the cuſtomary feudal law of all the countries ſubject to the empire. No other country has ever acknowledged theſe books for their law; but each ſtate has formed to itſelf ſuch a ſyſtem of feudal rules, as beſt agreed with the genius of its own conſtitution. In feudal queſtions, therefore, we are governed, in the firſt place, by our own ſtatutes and cuſtoms; where theſe fail us, we have regard to the practice of neighbouring countries, if the genius of their law appears to be the ſame with ours; and ſhould the queſtion ſtill remain doubtful, we may have recourſe to thoſe written books of the feus, as to the original plan on which all feudal ſyſtems have proceeded.

3. This military grant got the name, firſt of *beneficium*, and afterwards of *feudum*; and was defined a gratuitous right to the property of lands, made under the conditions of fealty and military ſervice, to be performed to the granter by the receiver; the radical right of the lands ſtill remaining in the granter. Under lands, in this definition, are comprehended all rights or ſubjects ſo connected with land, that they are deemed a part thereof; as houſes, mills, fiſhings, juriſdictions, patronages, *&c.* Though feus in their original nature were gratuitous, they ſoon became the ſubject of commerce; ſervices of a civil or religious kind were freqeuntly ſubſtituted in place of military; and now, of a long time, ſervices of every kind have been entirely diſpenſed with, in certain feudal tenures. He who makes the grant is called the ſuperior, and he who receives it the vaſſal. The ſubject of the grant is commonly called the feu; though that word is at other times, in our law, uſed to ſignify one particular tenure. See Tit. 11. The intereſt retained by the ſuperior in the feu is ſtyled *dominium directum*, or the ſuperiority; and the intereſt acquired by the vaſſal, *dominium utile*, or the property. The word *fee* is promiſcuouſly applied to both.

4. Allodial goods are oppoſed to feus; by which are underſtood, goods enjoyed by the owner, independent of a ſuperior. All moveable goods are allodial; lands only are ſo, when they are given without the condition of fealty or homage. By the feudal ſyſtem, the ſovereign, who is the fountain of feudal rights, reſerves to himſelf the ſuperiority of all the lands of which he makes the grant; ſo that, with us, no lands are allodial, except thoſe of the King's own property, the ſuperiorities which the King reſerves in the property-lands of his ſubjects, and manſes and glebes, the right of which is compleated by the preſbytery's deſignation, without any feudal grant.

5. Every perſon who is in the right of an immoveable ſubject, provided he has the free adminiſtration of his eſtate, and is not debarred by ſtatute, or by the nature of his right, may diſpoſe of it to another. Nay, a vaſſal, though he has only the *dominium utile*, can ſubfeu his property to a ſubvaſſal by a ſubaltern right, and thereby raiſe a new *dominium directum* in himſelf, ſubordinate to that which is in his ſuperior; and ſo *in infinitum*. The vaſſal who thus ſubfeus, is called the ſubvaſſal's immediate ſuperior, and the vaſſal's ſuperior is the ſubvaſſal's mediate ſuperior.

6. All perſons who are not diſabled by law, may acquire and enjoy feudal righs. Papiſts cannot purchaſe a land eſtate by any voluntary deed. Aliens, who owe allegiance to a foreign prince, cannot hold a feudal right without naturalization; and therefore, where ſuch privilege was intended to be given to favoured nations or perſons, ſtatutes of naturalization were neceſſary, either general, or ſpecial; or at leaſt, letters of naturalization by the ſovereign.

7. Every heritable ſubject, capable of commerce, may be granted in feu. From this general rule is excepted, 1. The annexed property of the Crown, which is not alienable without a previous diſſolution in parliament. 2. Tailzied lands, which are deviſed under condition that they ſhall not be aliened. 3. An eſtate *in hereditate jacente* cannot be effectually aliened by the heir-apparent (*i. e.* not entered); but ſuch alienation becomes

becomes effectual upon his entry, the supervening right accruing in that case to the purchaser; which is a rule applicable to the alienation of all subjects not belonging to the vender at the time of the sale.

8. The feudal right, or, as it is called, investiture, is constituted by charter and seisin. By the charter, we understand that writing which contains the grant of the feudal subject to the vassal, whether it be executed in the proper form of a charter, or of a disposition. Charters by subject-superiors are granted, either, 1. *A me de superiore meo*, when they are to be holden, not of the granter himself, but of his superior. This sort is called a public holding, because vassals were in ancient times publicly received in the superior's court before the *pares curiæ* or co-vassals. Or, 2. *De me*, where the lands are to be holden of the granter. These were called sometimes base rights, from *bas*, *lower*; and sometimes private, because, before the establishment of our records, they were easily concealed from third parties; the nature of all which will be more fully explained, Tit. 14. An original charter is that by which the fee is first granted: A charter by progress is a renewed disposition of that fee to the heir or assigney of the vassal. All doubtful clauses in charters by progress ought to be construed agreeably to the original grant; and all clauses in the original charter are understood to be implied in the charters by progress, if there be no express alteration.

9. The first clause in an original charter, which follows immediately after the name and designation of the granter, is the narrative or recital, which expresses the causes inductive of the grant. If the grant be made for a valuable consideration, it is said to be onerous; if for love and favour, gratuitous. In the dispositive clause of a charter, the subjects made over are described either by special boundaries or march-stones, (which is called a bounding charter), or by such other characters as may sufficiently distinguish them. A charter regularly carries right to no subjects but what are contained in this clause, though they should be mentioned in some other clause of the charter.

10. The clause of *tenendas* (from its first words, *tenendas prædictas terras*) expresses the particular tenure by which the lands are to be holden. The clause of *reddendo* (from the words, *reddendo inde annuatim*) specifies the particular duty or service which the vassal is to pay or perform to the superior.

11. The clause of warrandice is that by which the granter obliges himself that the right conveyed shall be effectual to the receiver. Warrandice is either personal or real. Personal warrandice, where the granter is only bound personally, is either, 1. Simple, that he shall grant no deed in prejudice of the right; and this sort, which is confined to future deeds, is implied even in donations. 2. Warrandice from fact and deed, by which the granter warrants that the right neither has been, nor shall be hurt by any fact of his. Or, 3. Absolute warrandice *contra omnes mortales*, whereby the right is warranted against all legal defects in it, which may carry it off from the receiver, either wholly or in part. Where a sale of lands proceeds upon an onerous cause, the granter is liable in absolute warrandice, though no warrandice be expressed; but in assignations to debts or decrees, no higher warrandice than from fact and deed is implied.

12. Gratuitous grants by the Crown imply no warrandice; and though warrandice should be expressed, the clause is ineffectual, from a presumption, that it has crept in by the negligence of the Crown's officers. But where the Crown makes a grant, not *jure coronæ*, but for an adequate price, the sovereign is in the same case with his subjects.

13. Absolute warrandice, in case of eviction, affords an action to the grantee, against the granter, for making up to him all that he shall have suffered through the defect of the right; and not simply for his indemnification, by the granter's repayment of the price to him. But as warrandice is penal, and consequently *stricti juris*, it is not easily presumed, nor is it incurred from every light servitude that may affect the subject, far less does it extend to burdens which may affect the subject posterior to the grant, nor to those imposed by public statute, whether before or after, unless specially warranted against.

14. Real warrandice is either, 1. Express, whereby, in security of the lands principally conveyed, other lands, called warrandice-lands, are also made over, to which the receiver may have recouse in case the principal lands be evicted. Or, 2. Tacit, which is constituted by the exchange or excambion of one piece of ground with another; for, if the lands exchanged are carried off from either of the parties, the law itself, without any paction, gives that party immediate recourse upon his own first lands, given in exchange for the lands evicted.

15. The chapter concludes with a precept of seisin, which is the command of the superior granter of the right to his bailie, for giving seisin or possession to the vassal, or his attorney, by delivering to him the proper symbols. Any person, whose name may be inserted in the blank, left in the precept for that purpose, can execute the precept as bailie; and whoever has the precept of seisin in his hands, is presumed to have a power of attorney from the vassal, for receiving possession in his name.

16. A seisin is the instrument or attestation of a notary, that possession was actually given by the superior or his bailie, to the vassal or his attorney; which is considered as so necessary a solemnity, as not to be suppliable, either by a proof of natural possession, or even of the special fact that the vassal was duly entered to the possession by the superior's bailie.

17. The symbols, by which the delivery of possession is expressed, are, for lands, earth and stone; for rights of annualrent payable forth of land, it is also earth and stone, with the addition of a penny money; for parsonage-teinds, a sheaf of corn; for jurisdictions, the book of the court; for patronages, a psalm book, and the keys of the church; for fishings, net and coble; for mills, clap and happer, *&c.* The seisin must be taken upon the ground of the lands, except where there is a special dispensation in the charter from the Crown.

18. All seisins must be registred within sixty days after their date, either in the general register of seisins at Edinburgh; or in the register of the particular shire appointed by the act 1617; which, it must be observed, is not, in every case, the shire within which the lands lie. Burgage-

gage seisins are ordained to be registred in the books of the borough.

19. Unregistred seisins are ineffectual against third parties, but they are valid against the granters and their heirs. Seisins regularly recorded, are preferable, not according to their own dates, but the dates of their registration.

20. Seisin necessarily supposes a superior by whom it is given; the right therefore which the sovereign, who acknowledges no superior, has over the whole lands of Scotland, is constituted, *jure coronæ*, without seisin. In several parcels of land, that lie contiguous to one another, one seisin serves for all, unless the right of the several parcels be either holden of different superiors, or derived from different authors, or enjoyed by different tenures under the same superior. In discontiguous lands, a separate seisin must be taken on every parcel, unless the sovereign has united them into one tenandry, by a charter of union; in which case, if there is no special place expressed, a seisin taken on any part of the united lands will serve for the whole, even though they be situated in different shires. The only effect of union is, to give the discontiguous lands the same quality as if they had been contiguous, or naturally united; union, therefore, does not take off the necessity of separate seisins, in lands holden by different tenures, or the rights of which flow from different superiors, these being incapable of natural union.

21. The privilege of barony carries a higher right than union does, and consequently includes union in it as the lesser degree. This right of barony can neither be given, nor transmitted, unless by the Crown; but the quality of simple union, being once conferred on lands by the sovereign, may be communicated by the vassal to a subvassal. Though part of the lands united or erected into a barony, be sold by the vassal to be holden *a me*, the whole union is not thereby dissolved: what remains unsold retains the quality.

22. A charter, not perfected by seisin, is a right merely personal, which does not transfer the property, (see Tit. xx. 1.) and a seisin of itself bears no faith, without its warrant: It is the charter and seisin joined together that constitutes the feudal right, and secures the receiver against the effect of all posterior seisins, even though the charters on which they proceed should be prior to his.

23. No quality which is designed as a lien or real burden on a feudal right, can be effectual against singular successors, if it be not inserted in the investiture. If the creditors in the burden are not particularly mentioned, the burden is not real; for no perpetual unknown incumbrance can be created upon lands. Where the right itself is granted with the burden of the sum therein mentioned, or where it is declared void, if the sum be not paid against a day certain, the burden is real; but where the receiver is simply obliged by his acceptance to make payment, the clause is effectual only against him and his heirs.

Tit. II. *Of the several kinds of Holding.*

Feudal subjects are chiefly distinguished by their different manners of holding, which were either ward, blanch, feu, or burgage. Ward holding, which is now abolished by 20. *Geo.* II. *c.* 50. was that which was granted for military service. Its proper *reddendo* was, *services*, or *services used and wont*; by which last was meant the performance of service whenever the superior's occasions required it. As all feudal rights were originally held by this tenure, ward-holding was *in dubio*. Hence, though the *reddendo* had contained some special service, or yearly duty, the holding was presumed ward, if another holding was not particularly expressed.

2. Feu holding is that whereby the vassal is obliged to pay to the superior a yearly rent in money or grain, and sometimes also in services proper to a farm, as ploughing, reaping, carriages for the superior's use, *&c. nomine feudi firmæ*. This kind of tenure was introduced for the encouragement of agriculture, the improvement of which was considerably obstructed by the vassal's obligation to military service. It appears to have been a tenure known in Scotland as far back as *leges burgorum*.

3. Blanch-holding is that whereby the vassal is to pay to the superior an elusory yearly duty, as a penny money, a rose, a pair of gilt spurs, *&c.* merely in acknowledgment of the superiority, *nomine albæ firmæ*. This duty, where it is a thing of yearly growth, if it be not demanded within the year, cannot be exacted thereafter; and where the words, *si petatur tantum*, are subjoined to the *reddendo*, they imply a release to the vassal, whatever the quality of the duty may be, if it is not asked within the year.

4. Burgage holding is that, by which boroughs-royal hold of the sovereign the lands which are contained in their charters of erection. This, in the opinion of *Craig*, does not constitute a separate tenure, but is a species of ward-holding; with this speciality, that the vassal is not a private person, but a community: And indeed, watching and warding, which is the usual service contained in the *reddendo* of such charters, might be properly enough said, some centuries ago, to have been of the military kind. As the royal borough is the King's vassal, all burgage-holders hold immediately of the Crown: The magistrates therefore, when they receive the resignations of the particular burgesses, and give seisin to them, act, not as superiors, but as the King's bailies specially authorised thereto.

5. Feudal subjects, granted to churches, monasteries, or other societies for religious or charitable uses, are said to be mortified, or granted *ad manum mortuam*; either because all casualties must necessarily be lost to the superior, where the vassal is a corporation, which never dies: or because the property of these subjects is granted to a dead hand, which cannot transfer it to another. In lands mortified in times of Popery to the church, whether granted to prelates for the behoof of the church, or *in puram eleemosynam*; the only services prestable by the vassal were prayers, and singing of masses for the souls of the deceased, which approaches nearer to blanch-holding than ward. The purposes of such grants having been, upon the reformation, declared superstitious, the lands mortified were annexed to the Crown: But mortifications

to

to univerſities, hoſpitals, *&c.* were not affected by that annexation; and lands may, at this day, be mortified to any lawful purpoſe, either by blanch or by feu holding.

Tit. 12. *Of the Caſualties due to the Superior.*

THE right of the ſuperior continues unimpaired, notwithſtanding the feudal grant, unleſs in ſo far as the *dominium utile*, or property, is conveyed to his vaſſal. The ſuperiority carries a right to the ſervices and annual duties contained in the *reddendo* of the vaſſal's charter. The duty payable by the vaſſal is a *debitum fundi*; *i. e.* it is recoverable, not only by a perſonal action againſt himſelf, but by a real action againſt the lands.

2. Beſides the conſtant fixed rights of ſuperiority, there are others, which, becauſe they depend upon uncertain events, are called caſualties.

3. The caſualties proper to a ward holding, while that tenure ſubſiſted, were ward, recognition, and marriage, which it is now unneceſſary to explain, as by the late ſtatutes 20 and 25 *Geo.* II. for aboliſhing ward-holdings, the tenure of the lands holden ward of the Crown or Prince is turned into *blanch*, for payment of one penny Scots yearly, *ſi petatur tantum*; and the tenure of thoſe holden of ſubjects, into *feu*, for payment of ſuch yearly feu-duty in money, victual, or cattle, in place of all ſervices, as ſhall be fixed by the court of Seſſion. And accordingly that court, by act of ſederunt Feb. 8. 1749, laid down rules for aſcertaining the extent of theſe feu-duties.

4. The only caſualty, or rather forfeiture, proper to feu-holdings, is the loſs or tinſel of the feu-right, by the neglect of payment of the feu-duty for two full years. Yet where there is no conventional irritancy in the feu-right, the vaſſal is allowed to purge the legal irritancy at the bar; that is, he may prevent the forfeiture, by making payment before ſentence: but where the legal irritancy is fortified by a conventional, he is not allowed to purge, unleſs where he can give a good reaſon for the delay of payment.

5. The caſualties common to all holdings are, non-entry, relief, liferent-eſcheat, diſclamation, and purpreſture. NON-ENTRY is that caſualty which ariſes to the ſuperior out of the rents of the feudal ſubject, through the heir's neglecting to renew the inveſtiture after his anceſtor's death. The ſuperior is intitled to this caſualty, not only where the heir has not obtained himſelf infeft, but where his retour is ſet aſide upon nullities. The heir, from the death of the anceſtor, till he be cited by the ſuperior in a proceſs of general declarator of non-entry, loſes only the retoured duties of his lands, (ſee next parag.); and he forfeits theſe, though his delay ſhould not argue any contempt of the ſuperior, becauſe the caſualty is conſidered to fall, as a condition implied in the feudal right, and not as a penalty of tranſgreſſion: But, where the delay proceeds not from the heir, but from the ſuperior, nothing is forfeited.

6. For underſtanding the nature of retoured duties, it muſt be known, that there was anciently a general valuation of all the lands in Scotland, deſigned both for regulating the proportion of public ſubſidies, and for aſcertaining the quantity of non-entry and relief-duties payable to the ſuperior; which appears, by a contract betwixt K. R. Bruce and his ſubjects *anno* 1327, preſerved in the library of the faculty of advocates, to have been ſettled at leaſt as far back as the reign of Alexander III. This valuation became in the courſe of time, by the improvement of agriculture, and perhaps alſo by the heightning of the nominal value of our money, from the reign of Robert I. downwards to that of James III. much too low a ſtandard for the ſuperior's caſualties: Wherefore, in all ſervices of heirs, the inqueſt came at laſt to take proof likewiſe of the preſent value of the lands contained in the brief (*quantum nunc valent*) in order to fix theſe caſualties. The firſt was called the old, and the other the new extent. Though both extents were ordained to be ſpecified in all retours made to the Chancery upon brieves of inqueſt; yet by the appellation of retoured duties in a queſtion concerning caſualties, the new extent is always underſtood. The old extent continued the rule for levying public ſubſidies, till a tax was impoſed by new proportions, by ſeveral acts made during the uſurpation. By two acts of Cromwell's parliament, held at Weſtminſter 1656, impoſing taxations on Scotland, the rates laid upon the ſeveral counties are preciſely fixed. The ſubſidy granted by the act of convention 1667, was levied on the ſeveral counties, nearly in the ſame proportions that were fixed by the uſurper in 1656; and the ſums to which each county was ſubjected were ſubdivided among the individual land-holders in that county, according to the valuations already ſettled, or that ſhould be ſettled by the commiſſion appointed to carry that act into execution. The rent fixed by theſe valuations is commonly called the valued rent; according to which the land tax, and moſt of the other public burdens, have been levied ſince that time.

7. In feu-holdings, the feu-duty is retoured as the rent, becauſe the feu-duty is preſumed to be, and truly was at firſt, the rent. The ſuperior therefore of a feu-holding gets no non-entry, before citation in the general declarator; for he would have been intitled to the yearly feu-duty, though the fee had been full, *i. e.* though there had been a vaſſal infeft in the lands. The ſuperior of teinds gets the fifth part of the retoured duty as non-entry, becauſe the law conſiders teinds to be worth a fifth part of the rent. In rights of annualrent which are holden of the granter, the annualrenter becomes his debtor's vaſſal; and the annualrent contained in the right is retoured to the blanch or other duty contained in the right before declarator.

8. It is becauſe the retoured duty is the preſumed rent, that the non-entry is governed by it. If therefore no retour of the lands in non-entry can be produced, nor any evidence brought of the retoured duty, the ſuperior is intitled to the real, or at leaſt to the valued rent, even before citation. In lands formerly holden ward of the King, the heir, in place of the retoured duties, is ſubjected only to the annual payment of one *per cent.* of the valued rent.

9. The heir, after he is cited by the ſuperior in the action of general declarator, is ſubjected to the full rents till

till his entry, because his neglect is less excusable after citation. The decree of declarator, proceeding on this action, intitles the superior to the possession, and gives him right to the rents, downward from the citation. As this sort of non-entry is properly penal, our law has always restricted it to the retoured duties, if the heir had a probable excuse for not entering.

10. Non entry does not obtain in burgage-holdings, because the incorporation of inhabitants holds the whole incorporated subjects of the King; and there can be no non-entry due in lands granted to communities, because there the vassal never dies: This covers the right of particulars from non-entry; for if non-entry be excluded with regard to the whole, it cannot obtain with regard to any part. It is also excluded, as to a third of the lands, by the terce, during the widow's life; and as to the whole of them, by the courtesy, during the life of the husband. But it is not excluded by a precept of seisin granted to the heir, till seisin be taken thereon.

11. RELIEF is that casualty which intitles the superior to an acknowledgement or consideration from the heir, for receiving him as vassal. It is called relief, because, by the entry of the heir, his fee is relieved out of the hands of the superior. It is not due in feu-holdings flowing from subjects, unless where it is expressed in the charter by a special clause for doubling the feu-duty at the entry of an heir; but in feu rights, holden of the crown, it is due, though there should be no such clause in the charter. The superior can recover this casualty, either by a poinding of the ground, as a *debitum fundi*, or by a personal action against the heir. In blanch and feu-holdings, where this casualty is expresly stipulated, a year's blanch or feu-duty is due in name of relief, beside the current year's duty payable in name of blanch or feu farm.

12. ESCHEAT (from *echeoir*, *to happen* or *fall*) is that forfeiture which falls through a person's being denounced rebel. It is either single or liferent. Single escheat, though it does not accrue to the superior, must be explained in this place, because of its coincidence with liferent.

13. After a debt is constituted, either by a formal decree, or by registration of the ground of debt, which to the special effect of execution, is in law accounted a decree; the creditor may obtain letters of horning, issuing from the signet, commanding messengers to charge the debtor to pay or perform his obligation, within a day certain. Where horning proceeds on a formal decree of the Session, the time indulged by law to the debtor is fifteen days; if upon a decree of the commission of teinds or admiral, it is ten; and upon the decrees of all inferior judges, fifteen days. Where it proceeds on a registred obligation, which specifies the number of days, that number must be the rule; and, if no precise number be mentioned, the charge must be given on fifteen days, which is the term of law, unless where special statute interposes; as in bills, upon which the debtor may be charged on six days.

14. The messenger must execute these letters (and indeed all summonses) against the debtor, either personally, or at his dwelling house; and, if he get not access to the house, he must strike six knocks at the gate, and thereafter affix to it a copy of his execution. If payment be not made within the days mentioned in the horning, the messenger, after proclaiming three oyesses at the market-cross of the head borough, of the debtor's domicile, and reading the letters there, blows three blasts with a horn, by which the debtor is understood to be proclaimed rebel to the King for contempt of his authority; after which, he must affix a copy of the execution to the market-cross: This is called the publication of the diligence, or a denounciation at the horn. Where the debtor is not in Scotland, he must be charged on sixty days, and denounced at the market cross of Edinburgh, and pier and shore of Leith.

15. Denunciation, if registered within fifteen days, either in the Sheriff's books, or in the general register, drew after it the rebel's single escheat, *i. e.* the forfeiture of his moveables to the Crown. Persons denounced rebels have not a *persona standi in judicio*; they can neither sue nor defend in any action. But this incapacity, being unfavourable, is personal to the rebel, and cannot be pleaded against his assignee.

16. Persons cited to the court of Justiciary may be also denounced rebels, either for appearing there with too great a number of attendants; or, if they fail to appear, they are declared fugitives from the law. Single escheat falls without denunciation, upon sentence of death pronounced in any criminal trial; and by special statute, upon one's being convicted of certain crimes, though not capital; as perjury, bigamy, deforcement, breach of arrestment, and usury. By the late act abolishing wardholdings, the casualties both of single and liferent escheat are discharged, when proceeding upon denunciation for civil debts; but they still continue, when they arise from criminal causes. All moveables belonging to the rebel at the time of his rebellion, (whether proceeding upon denunciation, or sentence in a criminal trial), and all that shall be afterwards acquired by him until relaxation, fall under single escheat. Bonds bearing interest, because they continue heritable *quoad fiscum*, fall not under it, nor such fruits of heritable subjects as become due after the term next ensuing the rebellion, these being reserved for the liferent escheat.

17. The King never retains the right of escheat to himself, but makes it over to a donatory, whose gift is not perfected, till, upon an action of general declarator, it be declared that the rebel's escheat has fallen to the crown by his denunciation, and that the right of it is now transferred to the pursuer by the gift in his favour: Every creditor therefore of the rebel, whose debt was contracted before rebellion, and who has used diligence before declarator, is preferable to the donatory. But the escheat cannot be affected by any debt contracted, nor by any voluntary deed of the rebel after rebellion.

18. The rebel, if he either pays the debt charged for, or suspends the diligence, may procure letters of relaxation from the horn, which, if published in the same place, and registred fifteen days thereafter in the same register with the denunciation, have the effect to restore him to his former state; but they have no retrospect, as to the

moveables already fallen under escheat, without a special clause for that purpose.

19. The rebel, if he continues unrelaxed for year and day after rebellion, is construed to be civilly dead: And therefore, where he holds any feudal right, his superiors, as being without a vassal, are entitled, each of them, to the rents of such of the lands belonging to the rebel as holds of himself, during all the days of the rebel's natural life, by the casualty of LIFERENT-ESCHEAT; except where the denunciation proceeds upon treason or proper rebellion, in which case the liferent falls to the King.

20. It is that estate only, to which the rebel has a proper right of liferent in his own person, that falls under his liferent escheat.

21. Though neither the superior nor his donatory can enter into possession in consequence of this casualty, till decree of declarator; yet that decree, being truly declaratory, has a retrospect, and does not so properly confer a new right, as declare the right formerly constituted to the superior, by the civil death of his vassal. Hence, all charters or heritable bonds, though granted prior to the rebellion, and all adjudications, though led upon debts contracted before that period, are ineffectual against the liferent escheat, unless seisin be taken thereon within year and day after the granter's rebellion.

22. Here, as in single escheat, no debt contracted after rebellion can hurt the donatory, nor any voluntary right granted after that period, though in security or satisfaction of prior debts.

23. DISCLAMATION is that casualty whereby a vassal forfeits his whole feu to his superior, if he disowns or disclaims him without ground, as to any part of it. PURPRESTURE draws likewise a forfeiture of the whole feu after it, and is incurred by the vassal's incroaching upon any part of his superior's property, or attempting, by building, inclosing, or otherwise, to make it his own. In both these feudal delinquencies, the least colour of excuse saves the vassal.

24. All grants from the crown, whether charters, gifts of casualties, or others, proceed on signatures which pass the signet. When the King resided in Scotland, all signatures were superscribed by him; but, on the accession of James VI. to the crown of England, a cachet or seal was made, having the King's name engraved on it, in pursuance of an act of the Privy Council, *April* 4. 1603, with which all signatures were to be afterwards sealed, that the Lords of exchequer were impowered to pass; and these powers are transferred to the court of Exchequer, which was established in Scotland after the union of the two kingdoms in 1707. Grants of higher consequence, as remissions of crimes, gifts proceeding upon forfeiture, and charters of *novodamus*, must have the King's sign-manual for their warrant.

25. If lands holding of the Crown were to be conveyed, the charter passed, before the union of the kingdoms in 1707, by the great seal of Scotland; and now by a seal substituted in place thereof. Grants of church-dignities, during episcopacy, passed also by the great seal; and the commissions to all the principal officers of the Crown, as Justice Clerk, King's Advocate, Solicitor, *&c.* do so at this day. All rights which subjects may transmit by simple assignation, the King transmits by the privy seal; as gifts of moveables, or of casualties that require no seisin. The quarter seal, otherwise called the testimonial of the great seal, is appended to gifts of tutory, commissions of brieves issuing from the chancery, and letters of presentation to lands holding of a subject, proceeding upon forfeiture, bastardy, or *ultimus hæres*.

26. Seals are to royal grants, what subscription is to rights derived from subjects, and give them authority: They serve also as a check to gifts procured (*subreptione vel obreptione*) by concealing the truth, or expressing a falsehood; for, where this appears, the gift may be stopped before passing the seals, though the signature should have been signed by the King. All rights passing under the great or privy seal must be registered in the registers of the great or privy seal *respectivé*, before appending the seal.

Tit. 13. *Of the Right which the Vassal acquires by getting the Feu.*

UNDER the *dominium utile* which the vassal acquires by the feudal right, is comprehended the property of whatever is considered as part of the lands, whether of houses, woods, inclosures, *&c.* above ground; or of coal, limestone, minerals, *&c.* under ground. Mills have, by the generality of our lawyers, been deemed a separate tenement, and so not carried by a charter or disposition, without either a special clause conveying mills, or the erection of the lands into a barony. Yet it is certain, that, if a proprietor builds a mill on his own lands, it will be carried by his entail, or by a retour, without mentioning it, although the lands are not erected into a barony. If the lands disponed be astricted, or thirled to another mill, the purchaser is not allowed to build a new corn-mill on his property, even though he should offer security that it shall not hurt the thirle; which is introduced for preventing daily temptations to fraud.

2. Proprietors are prohibited to build dove-cotes, unless their yearly rent, lying within two miles thereof, extend to ten chalders of victual. A purchaser of lands, with a dove-cote, is not obliged to pull it down, though he should not be qualified to build one; but, if it becomes ruinous, he cannot rebuild it. The right of brewing, though not expressed in the grant, is implied in the nature of property; as are also the rights of fishing, fowling, and hunting, in so far as they are not restrained by statute.

3. There are certain rights naturally consequent on property, which are deemed to be reserved by the crown as *regalia*: unless they be specially conveyed. Gold and silver mines are of this sort: The first universally; and the other, where three half-pennies of silver can be extracted from the pound of lead, by act 1424, (three half-pennies at that time was equal to about two shillings five pennies of our present Scots money.) These were by our ancient law annexed to the Crown; but they are now dissolved from it; and every proprietor is intitled to a grant of the mines within his own lands, with the burden of delivering to the crown a tenth of what shall be brought up.

4. Salmon-

4. Salmon-fishing is likewise a right understood to be reserved by the Crown, if it be not expresly granted; but forty years possession thereof, where the lands are either erected into a barony, or granted with the general clause of fishings, establish as the full right of the salmon fishing in the vassal. A charter of lands, within which any of the king's forests lie, does not carry the property of such forest to the vassal.

5. All the subjects, which were by the Roman law accounted *res publicæ*, as rivers, high ways, ports, *&c.* are, since the introduction of feus, held to be *inter regalia*, or *in patrimonio principis*; and hence incroachment upon a highway is said to infer purpresture. No person has the right of a free port without a special grant, which implies a power in the grantee to levy anchorage and shore dues, and an obligation upon him to uphold the port in good condition. In this class of things, our forefathers reckoned fortalices, or small places of strength, originally built for the defence of the country, either against foreign invasions, or civil commotions; but these now pass with the lands in every charter,

6. The vassal acquires right by his grant, not only to the lands specially contained in the charter, but to those that have been possessed forty years as pertinent thereof. But, 1. If the lands in the grant are marked out by special limits, the vassal is circumscribed by the tenor of his own right, which excludes every subject without these limits from being pertinent of the lands. 2. A right possessed under an expres infeftment is preferable, *cæteris paribus*, to one possessed only as pertinent, 3. Where neither party is infeft *per expressum*, the mutual promiscuous possession by both, of a subject as pertinent, resolves into a commonty of the subject possessed: But if one of the parties has exercised all the acts of property of which the subject was capable, while the possession of the other was confined to pasturage only, or to casting feal and divot, the first is to be deemed sole proprietor, and the other to have merely a right of servitude.

7. As barony is a *nomen universitatis*, and unites the several parts contained in it into one individual right, the general conveyance of a barony carries with it all the different tenements of which it consists, though they should not be specially enumerated, (and this holds, even without erection into a barony, in lands that have been united under a special name.) Hence likewise, the possession by the vassal of the smallest part of the barony lands preserves to him the right of the whole.

8. The vassal is intitled, in consequence of his property, to levy the rents of his own lands, and to recover them from his tenants by an action for rent before his own court; and from all other possessors and intromitters, by an action of mails and duties before the Sheriff. He can also remove from his lands, tenants who have no leases, and he can grant tacks or leases to others. A tack is a contract of location, whereby the use of land or any other immoveable subject, is set to the lessee or tacksman for a certain yearly rent, either in money, the fruits of the ground, or services. It ought to be reduced into writing, as it is a right concerning lands; tacks therefore, that are given verbally, to endure for term of years, are good against neither party, for more than one year. An obligation to grant a tack is as effectual against the granter, as a formal tack. A liferenter, having a temporary property in the fruits, may grant tacks to endure for the term of his own liferent.

9. The tacksman's right is limited to the fruits which spring up annually from the subject set, either naturally, or by the industry of the tacksman; he is not therefore intitled to any of the growing timber above ground, and far less to the minerals, coal, clay, *&c.* under ground, the use of which consumes the substance. Tacks are, like other contracts, personal rights in their own nature, and consequently ineffectual against singular successors in the lands; but, for the encouragement of agriculture, they were, by act 1449, declared effectual to the tacksman for the full time of their endurance, into whose hands soever the lands might come.

10. To give a written tack the benefit of this statute, it must mention the special tack duty payable to the proprietor, which though small, if it be not elusory, secures the tacksman; and it must be followed by possession, which supplies the want of a seisin. If a tack does not expres the term of entry, the entry will commence at the next term after its date, agreeable to the rule, *Quod puré debetur, præsenti die debetur*. If it does not mention the ish, *i. e.* the term at which it is to determine, it is good for one year only; but, if the intention of parties to continue it for more than one year, should appear from any clause in the tack, it is sustained for two years as the *minimum*. Tacks granted to perpetuity, or with an indefinite ish, have not the benefit of the statute. Tacks of houses within borough do not fall within this act.

11. Tacks necessarily imply a *delectus personæ*, a choice by the setter of a proper person for his tenant. Hence the conveyance of a tack, which is not granted to assignees, is ineffectual without the landlord's consent. A right of tack, though it be heritable, falls under the *jus mariti*, because it cannot be separated from the labouring cattle and implements of tillage, which are moveable subjects. A tack therefore granted to a single woman without the liberty of assigning, falls by her marriage, because the marriage, which is a legal conveyance thereof to the husband, cannot be annulled. This implied exclusion of assignees, is however limited to voluntary, and does not extend to necessary assignments, as an adjudication of a tack by the tacksman's creditor; but a tack, expresly excluding assignees, cannot be carried even by adjudication. But tacksmen may subset, unless subtenants are expresly excluded; and liferent tacks, because they import a higher degree of right in the tacksman, than tacks for a definite term, may be assigned, unless assignees be specially excluded.

12. If neither the setter nor tacksman shall properly discover their intention to have the tack dissolved at the term fixed for its expiration, they are understood, or presumed, to have entered into a new tack upon the same terms with the former, which is called *tacit relocation*, and continues till the landlord warns the tenant to remove, or the tenant renounces his tack to the landlord: This obtains also in the case of moveable tenants, who possess from year to year without written tacks.

13. In tacks of land, the setter is commonly bound to put

put all the houses and office houses, necessary for the farm, in good condition at the tenant's entry; and the tenant must keep them and leave them so at his removal. But in tacks of houses, the setter must not only deliver to the tenant the subject set, in tenantable repair at his entry, but uphold it in that repair during the whole years of the tack.

14. If the inclemency of the weather, inundation, or calamity of war, should have brought upon the crop an extraordinary damage *(plus quam tolerabile)*, the landlord had, by the Roman law, no claim for any part of the tack-duty: If the damage was more moderate, he might exact the full rent. It is no where defined, what degree of sterility or devastation makes a loss not to be borne; but the general rule of the Roman law seems to be made ours. Tenants are obliged to pay no public burdens, to which they are not expresly bound by their tacks, except mill-services.

15. Tacks may be evacuated during their currency, 1. In the same manner as feu-rights, by the tacksman's running in arrear of his tack-duty for two years together. This irritancy may be prevented by the tenant's making payment at the bar before sentence. 2. Where the tenant either runs in arrear of one year's rent, or leaves his farm uncultivated at the usual season; in which case he may be ordained to give security for the arrears, and for the rent of the five following crops, if the tack shall subsist so long; otherwise, to remove, as if the tack were at an end. 3. Tacks may be evacuated at any time, by the mutual consent of parties.

16. The landlord, when he intends to remove a tenant whose tack is expiring, or who possesses without a tack, must, upon a precept signed by himself, warn the tenant forty days preceding the term of Whitsunday, at or immediately preceding the ish, personally, or at his dwelling house, to remove at that term, with his family and effects. This precept must be also executed on the ground of the lands, and thereafter read in the parish-church where the lands lie, after the morning service, and affixed to the most patent door thereof. Whitsunday, though it be a moveable feast, is, in questions of removing, fixed to the 15th of May. In warnings from tenements within borough, it is sufficient that the tenant be warned forty days before the ish of the tack, whether it be Whitsunday or Martinmas; and in these the ceremony of chalking the door is sustained as warning, when proceeding upon a verbal order from the proprietor.

17. This process of warning was precisely necessary for founding an action of removing against tenants, till act of sederunt of the court of Session, *Dec.* 14. 1756, which leaves it in the option of the proprietor, either to use the former method, or to bring his action of removing before the Judge ordinary; which, if it be called forty days before the said term of Whitsunday, shall be held as equal to a warning. Where the tenant is bound, by an express clause of his tack, to remove at the ish without warning, such obligation is, by the said act, declared to be a sufficient warrant for letters of horning, upon which, if the landlord charge his tenant forty days before the said Whitsunday, the judge is authorised to eject him within six days after the term of removing expressed in the tack.

18. Actions of removing might, even before this act of sederunt, have been pursued without any previous warning, 1. Against vicious possessors, *i. e.* persons who had seized the possession by force, or who, without any legal title, had intruded into it, after the last possessor had given it up. 2. Against possessors who had a naked tolerance. 3. Against tenants who had run in arrear of rent, during the currency of their tacks. 4. Again such as had sold their lands, and yet continued to possess after the term of the purchaser's entry. Upon the same ground, warning was not required, in removings against possessors of liferented lands, after the death of the liferenter who died in the natural possession: But if he possessed by tenants, these tenants could not be disturbed in their possessions till the next Whitsunday, that they might have time to look out for other farms; but they might be compelled to remove at that term, by an action of removing, without warning.

19. A landlord's title in a removing, let it be ever so lame, cannot be brought under question by a tenant whose tack flows immediately from him; but, if he is to insist against tenants not his own, his right must be perfected by infeftment, unless it be such as requires no infeftment, as terce, *&c.*

20. The defender, in a removing, must, before offering any defence which is not instantly verified, give security to pay to the setter the violent profits, if they should be awarded against him. These are so called, because the law considers the tenant's possession after the warning as violent. They are estimated, in tenements within borough, to double the rent; and in lands, to the highest profits the pursuer could have made of them, by possessing them either by a tenant, or by himself.

21. If the action of removing shall be passed from, or if the landlord shall, after using warning, accept of rent from the tenant, for any term subsequent to that of the removal, he is presumed to have changed his mind, and tacit relocation takes place. All actions of removing against the principal or original tacksman, and decrees thereupon, if the order be used, which is set forth *supra*, § 17. are, by the act of sederunt 1755, declared to be effectual again the assignees to the tack, or subtenants.

22. The landlord has, in security of his tack-duty, over and above the tenant's personal obligation, a tacit pledge or hypothec, not only in the fruits, but in the cattle pasturing on the ground. The corn, and other fruits, are hypothecated for the rent of that year whereof they are the crop; for which they remain affected, though the landlord should not use his right for years together.

23. The whole cattle on the ground, considered as a quantity, are hypothecated for a year's rent, one after another successively. The landlord may apply this hypothec payment of the past year's rent, at any time within three months from the last conventional term of payment, after which it ceases for that year. As the tenant may increase the subject of this hypothec. by purchasing oxen, sheep, *&c.* so he can impair it, by selling part of his stock; but if the landlord suspects the tenant's management, he may, by sequestration or poinding, make his right, which was before general upon the whole stock, special upon every individual. A superior has also a hypothec

pothec for his feu-duty, of the fame kind with that juft explained.

24. In tacks of houfes, breweries, fhops, and other tenements, which have no natural fruits, the furniture and other goods brought into the fubject fet are hypothecated to the landlord for one year's rent. But the tenant may by fale impair this hypothec, as he might that of cattle in rural tenements; and indeed, in the particular cafe of a fhop, the tenant rents it for no other purpofe, than as a place of fale.

Tit. 14. *Of the Tranfmiffion of Rights, by Confirmation and Refignation.*

A VASSAL may tranfmit his feu either to univerfal fucceffors, as heirs; or to fingular fucceffors, *i. e.* thofe who acquire by gift, purchafe, or other fingular title. This laft fort of tranfmiffion is either voluntary, by difpofition; or neceffary, by adjudication.

2. By the firft feudal rules, no fuperior could be compelled to receive any vaffal in the lands, other than the heir expreffed in the inveftiture; for the fuperior alone had the power of afcertaining to what order of heirs the fee granted by himfelf was to defcend. But this right of refufal in the fuperior did not take place, 1. In the cafe of creditors apprifers or adjudgers, whom fuperiors were obliged to receive upon payment of a year's rent. 2. In the cafe of purchafers of bankrupt eftates, who were put on the fame footing with adjudgers. The Crown refufes no voluntary difponee, on his paying a compofition to the exchequer of a fixth part of the valued rent. Now fuperiors are directed to enter all fingular fucceffors (except incorporations) who fhall have got from the vaffal a difpofition, containing procuratory of refignation; they always receiving the fees or cafualties that law entitles them to on a vaffal's entry, *i. e.* a year's rent.

3. Bafe rights, *i. e.* difpofitions to be holden of the difponer, are tranfmiffions only of the property, the fuperiority remaining as formerly. As this kind of right might, before eftablifhing the regifters, have been kept quite concealed from all but the granter and receiver, a public right was preferable to it, unlefs cloathed with poffeffion: But as this diftinction was no longer neceffary after the eftablifhment of the records, all infeftments are declared preferable, according to the dates of their feveral regiftrations; without refpect to the former diftinction of bafe and public, or of being cloathed and not cloathed with poffeffion.

4. Public rights, *i. e.* difpofitions to be holden of the granter's fuperior, may be perfected either by confirmation or refignation; and therefore, they generally contain both precept of feifin and procuratory of refignation. When the receiver is to complete his right in the firft way, he takes feifin upon the precept; but fuch feifin is ineffectual without the fuperior's confirmation; for the difponee cannot be deemed a vaffal, till the fuperior receive him as fuch, or confirm the holding. By the ufual ftyle in the tranfmiffion of lands, the difpofition contains an obligation and precept of infeftment, both *a me* and *de me*, in the option of the difponee; upon which, if feifin is taken indefinitely, it is conftrued in favour of the difponee to be a bafe infeftment, becaufe a public right is null without confirmation: But, if the receiver fhall afterwards obtain the fuperior's confirmation, it is confidered as if it had been from the beginning a public right.

5. Where two feveral public rights of the fame fubject are confirmed by the fuperior, their preference is governed by the dates of the confirmations, not of the infeftments confirmed; becaufe it is the confirmation which compleats a public right.

6. Though a public right becomes, by the fuperior's confirmation, valid from its date; yet if any mid impediment intervene betwixt that period and the confirmation, to hinder the two from being conjoined, *e. g.* if the granter of a public right fhould afterwards grant a bafe right to another, upon which feifin is taken before the fuperior's confirmation of the firft, the confirmation will have effect only from its own date; and confequently the bafe right firft compleated, will carry the *property* of the lands preferable to the public one.

7. Refignation is that form of law, by which a vaffal furrenders his feu to his fuperior; and it is either *ad perpetuam remanentiam*, or *in favorem*. In refignations *ad remanentiam*, where the feu is refigned, to the effect that it may remain with the fuperior, the fuperior, who before had the fuperiority, acquires, by the refignation, the property alfo of the lands refigned: and as his infeftment in the lands ftill fubfifted, notwithftanding the right by which he had given his vaffal the property; therefore, upon the vaffals refignation, the fuperior's right of property revives, and is confolidated with the fuperiority, without the neceffity of a new infeftment; but the inftrument of refignation muft be recorded.

8. Refignations *in favorem* are made, not with an intention that the property refigned fhould remain with the fuperior, but that it fhould be again given by him, in favour either of the refigner himfelf, or of a third party; confequently the fee remains in the refigner, till the perfon in whofe favour refignation is made gets his right from the fuperior perfected by feifin And becaufe refignations *in favorem*, are but incompleat perfonal deeds, our law has made no provifion for recording them. Hence, the firft feifin on a fecond refignation is preferable to the laft feifin upon the firft refignation; but the fuperior, accepting a fecond refignation, whereupon a prior feifin may be taken in prejudice of the firft refignatory, is liable in damages.

9. By our former decifions, one who was vefted with a perfonal right of lands, *i. e.* a right not compleated by feifin, effectually divefted himfelf by difponing it to another; after which, no right remained in the difponer, which could be carried by a fecond difpofition, becaufe a perfonal right is no more than a *jus obligationis*, which may be transferred by any deed fufficiently expreffing the will of the granter. But this doctrine, at the fame time that it rendered the fecurity of the records extremely uncertain, was not truly applicable to fuch rights as required feifin to complete them; and therefore it now obtains, that the granter even of a perfonal right of lands, is not fo divefted by conveying the right to one perfon, but that he may effectually make it over afterwards to another;

nother; and the preference between the two does not depend on the dates of the dispositions, but on the priority of the seisins following upon them.

Tit. 15. *Of redeemable Rights.*

An heritable right is said to be redeemable, when it contains a right of reversion, or return, in favour of the person from whom the right flows. Reversions are either legal, which arise from the law itself, as in adjudications, which law declares to be redeemable within a certain term after their date; or conventional, which are constituted by the agreement of parties, as in wadsets, rights of annualrent, and rights in security. A wadset (from wad or pledge) is a right, by which lands, or other heritable subjects, are impignorated by the proprietor to his creditor, in security of his debt; and, like other heritable rights, is perfected by seisin. The debtor, who grants the wadset, and has the right of reversion, is called the reverser; and the creditor, receiver of the wadset, is called the wadsetter.

Wadsets, by the present practice, are commonly made out in the form of mutual contracts, in which one party sells the land, and the other grants the right of reversion. When the right of reversion is thus incorporated in the body of the wadset, it is effectual without registration; because the singular successor in the wadset is, in that case, sufficiently certified of the reversion, though it be not registred, by looking into his own right, which bears it *in gremio*. But where the right of reversion is granted in a separate writing, it is ineffectual against the singular successor of the wadsetter, unless it be registred in the register of seisins within 60 days after the date of the seisin upon the wadset.

3. Rights of reversion are generally esteemed *stricti juris;* yet they go to heirs, though heirs should not be mentioned, unless there be some clause in the right, discovering the intention of parties, that the reversion should be personal to the reverser himself. In like manner, though the right should not express a power to redeem from the wadsetter's heir, as well as from himself, redemption will be competent against the heir. All our lawyers have affirmed, that reversions cannot be assigned, unless they are taken to assignees; but from the favour of legal diligence, they may be adjudged.

4. Reversions commonly leave the reverser at liberty to redeem the lands *quandocunqe,* without restriction in point of time; but a clause is adjected to some reversions, that if the debt be not paid against a determinate day, the right of reversion shall be irritated, and the lands shall become the irredeemable property of the wadsetter. Neverthelefs, the irritancy being penal, as in wadsets, the sum lent falls always short of the value of the lands, and the right of redemption is by indulgence continued to the reverser, even after the term has expired, while the irritancy is not declared. But the reverser, if he does not take the benefit of this indulgence, within forty years after the lapse of the term, is cut out of it by prescription.

5. If the reverser would redeem his lands, he must use an order of redemption against the wadsetter: the first step of which is premonition (or notice given under form of instrument) to the wadsetter, to appear at the time and place appointed by the reversion, then and there to receive payment of his debt, and thereupon to renounce his right of wadset. In the voluntary redemption of a right of wadset holden base, a renunciation duly registred re-establishes the reverser in the full right of the lands. Where the wadset was granted to be holden of the granter's superior, the superior must receive the reverser, on payment of a year's rent, if he produce a disposition from the wadsetter, containing procuratory of resignation. If, at executing the wadset, the superior has granted letters of regress, *i. e.* an obligation again to enter the reverser upon redemption of the lands, he will be obliged to receive him, without payment of the year's rent. But letters of regress will not have this effect against singular successors in the superiority, if they are not registred in the register of reversions. All wadsets that remain personal rights, are extinguished by simple discharges, though they should not be recorded.

6. If the wadsetter either does not appear at the time and place appointed, or refuses the redemption-money, the reverser must consign it under form of instrument, in the hands of the person thereto appointed in the right of reversion; or, if no person be named, in the hands of the clerk to the bills, a clerk of session, or any responsal person. An instrument of consignation, with the consignatory's receipt of the money consigned, compleats the order of redemption, stops the farther currency of interest against the reverser, and founds him in an action for declaring the order to be formal, and the lands to be redeemed in consequence of it.

7. After decree of declarator is obtained, by which the lands are declared to return to the debtor, the consigned money, which comes in place of the lands, becomes the wadsetter's, who therefore can charge the consignatory upon letters of horning to deliver it up to him; but, because the reverser may, at any time before decree, pass from his order, as one may do from any other step of diligence, the consigned sums continue to belong to the reverser, and the wadsetter's interest in the wadset continues heritable till that period.

8. If the wadsetter chuses to have his money rather than the lands, he must require from the reverser, under form of instrument, the sums due by the wadset, in terms of the right. The wadset sums continue heritable, notwithstanding requisition, which may be passed from by the wadsetter even after the reverser has consigned the redemption money in consequence thereof.

9. Wadsets are either proper or improper. A proper wadset is that whereby it is agreed, that the use of the land shall go for the use of the money; so that the wadsetter takes his hazard of the rents, and enjoys them without accounting, in satisfaction, or *in solutum* of his interest.

10. In an improper wadset, the reverser, if the rent should fall short of the interest, is taken bound to make up the deficiency; if it amounts to more, the wadsetter is obliged to impute the excrescence towards extinction of the capital: And, as soon as the whole sums, principal and interest, are extinguished by the wadsetter's possession,

session, he may be compelled to renounce, or divest himself in favour of the reverser.

11. If the wadsetter be intitled by his right to enjoy the rents without accounting, and if at the same time the reverser be subjected to the hazard of their deficiency, such contract is justly declared usurious; and also in all proper wadsets wherein any unreasonable advantage has been taken of the debtor, the wadsetter must, during the not requisition of the sum lent, either quit his possession to the debtor, upon his giving security to pay the interest, or subject himself to account for the suplus-rents, as in improper wadsets.

12. Infeftments of annualrent, the nature of which has been explained, are also redeemable rights. A right of annualrent does not carry the property of the lands, but it creates a real *nexus* or burden upon the property, for payment of the interest or annualrent contained in the right; and consequently, the bygone interests due upon it are *debita fundi.* The annualrenter may therefore either insist in a real action for obtaining letters of poinding the ground, or sue the tenant in a personal action towards the payment of his past interest: And in a competition for those rents, the annualrenter's preference will not depend on his having used a poinding of the ground, for his right was compleated by the seisin; and the power of poinding the ground, arising from that antecedent right, is *meræ facultatis*, and need not be exercised, if payment can be otherwise got. As it is only the interest of the sum lent which is a burden upon the lands, the annualrenter, if he wants his principal sum, cannot recover it either by poinding or by a personal action against the debtor's tenants, but must demand it from the debtor himself, on his personal obligation in the bond, either by requisition, or by a charge upon letters of horning, according as the right is drawn.

13. Rights of annualrent, being servitudes upon the property, and consequently consistent with the right of property in the debtor, may be extinguished without resignation.

14. Infeftments in security are another kind of redeemable rights (now frequently used in place of rights of annualrent), by which the receivers are infeft in the lands themselves, and not simply in an annualrent forth of them, for security of the principal sums, interest, and penalty, contained in the rights. If an infeftment in security be granted to a creditor, he may thereupon enter into the immediate possession of the lands or annualrent for his payment. They are extinguished as rights of annualrent.

15. All rights of annualrent, rights in security, and generally whatever constitutes a real burden on the fee, may be the ground of an adjudication, which is preferable to all adjudications, or other diligences, intervening between the date of the right and of the adjudication deduced on it; not only for the principal sum contained in the right, but also for the whole past interest contained in the adjudication. This preference arises from the nature of real debts, or *debita fundi*; but in order to obtain it for the interest of the interest accumulated in the adjudication, such adjudication must proceed on a process of poinding the ground.

Tit. 16. *Of Servitudes.*

Servitude is a burden affecting lands, or other heritable subjects, whereby the proprietor is either restrained from the full use of what is his own, or is obliged to suffer another to do something upon it. Servitudes are either natural, legal, or conventional. Nature itself may be said to constitute a servitude upon inferior tenements, whereby they must receive the water that falls from those that stand on higher ground. Legal servitudes are established by statute or custom, from considerations of public policy; among which may be numbered the restraints laid upon the proprietors of tenements within the city of Edinburgh. There is as great a variety of conventional servitudes, as there are ways by which the exercise of property may be restrained by paction in favour of another.

2. Conventional servitudes are constituted, either by grant, where the will of the party burdened is expressed in writing, or by prescription, where his consent is presumed from his acquiescence in the burden for 40 years. A servitude constituted by writing, or grant, is not effectual against the granter's singular successors, unless the grantee has been in the use or exercise of his right: But they are valid against the granter and his heirs, even without use. In servitudes that may be acquired by prescription, forty years exercise of the right is sufficient, without any title in writing, other than a charter and seisin of the lands, to which the servitude is claimed to be due.

3. Servitudes constituted by grant are not effectual, in a question with the superior of the tenement burdened with the servitude, unless his consent be adhibited; for a superior cannot be hurt by his vassal's deed: But, where the servitude is acquired by prescription, the consent of the superior, whose right afforded him a good title to interrupt, is implied. A servitude by grant, though followed only by a partial possession, must be governed, as to its extent, by the tenor of the grant; but a servitude by prescription is limited by the measure or degree of the use had by him who prescribes; agreeably to the maxim, *tantum præscriptum quantum possessum.*

4. Servitudes are either predial or personal. Predial servitudes are burdens imposed upon one tenement, in favour of another tenement. That to which the servitude is due is called the dominant, and that which owes it is called the servient tenement. No person can have right to a predial servitude, if he is not proprietor of some dominant tenement that may have benefit by it; for that right is annexed to a tenement, and so cannot pass from one person to another, unless some tenement goes along with it.

5. Predial servitudes are divided into rural servitudes, or of lands; and urban servitudes, or of houses. The rural servitudes of the Romans were *iter*, *actus*, *via*, *aquæductus*, *aquæhaustus*, and *jus pascendi pecoris.* Similar servitudes may be constituted with us, of a foot-road, horse-road, cart-road, dams, and aqueducts, watering of cattle, and pasturage. The right of a highway is not a servitude constituted in favour of a particular tenement, but is a right common to all travellers. The care of

of high-ways, bridges, and ferries, is committed to the sheriffs, justices of peace, and commissioners of supply in each shire.

6. Common pasturage, or the right of feeding one's cattle upon the property of another, is sometimes constituted by a general clause of pasturage in a charter or disposition, without mentioning the lands burdened; in which case, the right comprehends whatever had been formerly appropriated to the lands disponed out of the granter's own property, and likewise all pasturage due to them out of other lands. When a right of pasturage is given to several neighbouring proprietors, on a moor or common belonging to the granter, indefinite as to the number of cattle to be pastured, the extent of their several rights is to be proportioned according to the number that each of them can fodder in winter upon his own dominant tenement.

7. The chief servitudes of houses among the Romans were those of support, *viz. tigni immittendi*, and *oneris ferendi*. The first was the right of fixing in our neighbour's wall a joist or beam from our house: The second was that of resting the weight of one's house upon his neighbour's wall.

8. With us, where different floors or stories of the same house belong to different persons, as is frequent in the city of Edinburgh, the property of the house cannot be said to be entirely divided; the roof remains a common roof to the whole, and the area on which the house stands supports the whole; so that there is a communication of property, in consequence of which the proprietor of the ground floor must, without the constitution of any servitude, uphold it for the support of the upper, and the owner of the highest story must uphold that as a cover to the lower. Where the highest floor is divided into garrets among the several proprietors, each proprietor is obliged, according to this rule, to uphold that part of the roof which covers his own garret.

9. No proprietor can build, so as to throw the rain-water falling from his own house, immediately upon his neighbour's ground, without a special servitude, which is called of *stillicide*; but, if it falls within his own property, though at the smallest distance from the march, the owner of the inferior tenement must receive it.

10. The servitudes *altius non tollendi, et non officiendi luminibus vel prospectui*, restrain proprietors from raising their houses beyond a certain height, or from making any building whatsoever that may hurt the light or prospect of the dominant tenement. These servitudes cannot be constituted by prescription alone; for, though a proprietor should have built his house ever so low, or should not have built at all upon his grounds for forty years together, he is presumed to have done so for his own conveniency or profit; and therefore cannot be barred from afterwards building a house on his property, or raising it to what height he pleases, unless he be tied down by his own consent.

11. We have two predial servitudes to which the Romans were strangers, *viz.* that of fewel or feal and divot, and of thirlage. The first is a right, by which the owner of the dominant tenement may turn up peats, turfs, feals, or divots, from the ground of the servient, and carry them off either for fewel, or thatch, or the other uses of his own tenement.

12. THIRLAGE is that servitude, by which lands are astricted, or thirled, to a particular mill, and the possessors bound to grind their grain there, for payment of certain multures and sequels, as the agreed price of grinding. In this servitude, the mill is the dominant tenement, and the lands astricted (which are called also the thirle or sucken) the servient. Multure is the quantity of grain or meal payable to the proprietor of the mill, or to the multurer his tacksman. The sequels are the small quantities given to the servants, under the name of knaveship, bannock, and lock or gowpen. The quantities paid to the mill by the lands not astricted, are generally proportioned to the value of the labour, and are called out-town or out-sucken multures; but those paid by the thirle are ordinarily higher, and are called in-town or in-sucken multures.

13. Thirlage may be constituted by a land-holder, when, in the disposition of certain lands, he astricts them to his own mill; or when, in the disposition of a mill, he astricts his own lands to the mill disponed, or when, in letting his lands, he makes it a condition in the tacks. The grant of a mill with the general clause of multures, without specifying the lands astricted, conveys the thirlage of all the lands formerly astricted to that mill, whether they were the property of the granter, or of a third party.

14. A less formal constitution serves to astrict barony-lands to the mill of the barony, than is necessary in any other thirlage; which perhaps proceeds from the effects of the union between the two. Hence, if a baron makes over the mill of a barony, *cum multuris*, or *cum astrictis multuris*, it infers an astriction of the barony lands to the mill conveyed, even of such as had been before sold to another for a certain duty *pro omni alio onere*. But if, prior to the baron's conveyance of his mill *cum multuris*, he had sold any part of the barony-lands to another *cum multuris*, the first purchaser's lands are not astricted by the posterior grant; for a right of lands with the multures, implies a freedom of these lands from thirlage.

15. Thirlage is either, 1. Of grindable corns; or, 2. Of all growing corns; or, 3. Of the *invecta et illata*, *i. e.* of all the grain brought within the thirle, though of another growth. Where the thirlage is of grindable grain, it is in practice restricted to the corns which the tenants have occasion to grind, either for the support of their families, or for other uses; the surplus may be carried out of the thirle unmanufactured, without being liable in multure. Where it is of the *grana crescentia*, the whole grain growing upon the thirle is astricted, with the exceptions, 1. Of seed and horse-corn, which are destined to uses inconsistent with grinding; and, 2. Of the farm-duties due to the landlord, if they are deliverable in grain not grinded. But, if the rent be payable in meal, flour, or malt, the grain of which these are made must be manufactured in the dominant mill.

16. The thirlage of *invecta et illata* is seldom constituted but against the inhabitants of a borough or village, that they shall grind all the unmanufactured grain they import thither at the dominant mill. Multure, therefore, cannot be exacted in a thirlage of *invecta et illata*, for

flour or oat-meal brought into the fervient tenement, unlefs the importer had brought it in grain, and grinded it at another mill. The fame grain that owes multure, as *granum crefcens*, to the mill in whofe thirle it grew, if it fhall be afterwards brought within a borough where the *invecta et illata* are thirled, muft pay a fecond multure to the proprietor of that dominant tenement; but, where the right of thefe two thirlages is in the fame proprietor, he cannot exact both. Where lands are thirled of general terms, without expreffing the particular nature in the fervitude, the lighteft thirlage is prefumed, from the favour of liberty; but in the aftriction of a borough or village, where there is no growing grain which can be the fubject of thirlage, the aftriction of *invecta et illata* muft be neceffarily underftood.

17. Thirlage, in the general cafe, cannot be eftablifhed by prefcription alone, for *iis quæ funt meræ facultatis non præfcribitur;* but where one has paid for forty years together the heavy infucken multures, the flighteft title in writing will fubject his lands. Thirlage may be, contrary to the common rule, conftituted by prefcription alone, 1. Where one pays to a mill a certain fum, or quantity of grain yearly, in name of multure, whether he grinds at it or not (called dry multure.) 2. In mills of the King's property; which is conftituted *jure coronæ*, without titles in writing; and, where he derives right from another, his titles are more liable to be loft. This is extended in practice to mills belonging to church-lands, where thirty years poffeffion is deemed equivalent to a title in writing, from a prefumption that their rights were deftroyed at the reformation. Though thirlage itfelf cannot be conftituted by mere poffeffion, the proportion of multure payable to the dominant tenement may be fo fixed.

18. The poffeffors of the lands aftricted, are bound to uphold the mill, repair the dam-dykes and aqueducts, and bring home the millftones. Thefe fervices, though not expreffed in the conftitution, are implied.

19. Servitudes, being reftraints upon property, are *ftricti juris:* They are not therefore prefumed, if the acts upon which they are claimed can be explained confiftently with freedom; and, when fervitudes are conftituted, they ought to be ufed in the way leaft burdenfome to the fervient tenement. Hence, one who has a fervitude of peats upon his neighbour's mofs, is not at liberty to extend it for the ufe of any manufacture which may require an extraordinary expence of fewel; but muft confine it to the natural ufes of the dominant tenement.

20. Servitudes are extinguifhed, 1. *Confufione*, when the fame perfon comes to be proprietor of the dominant and fervient tenements; for *res fua nemini fervit*, and the ufe the proprietor thereafter makes of the fervient tenement is not *jure fervitutis*, but is an act of property. 2. By the perifhing, either of the dominant or fervient tenement. 3. Servitudes are loft *non utendo*, by the dominant tenement neglecting to ufe the right for forty years; which is confidered as a dereliction of it, though he, who has the fervient tenement, fhould have made no interruption, by doing acts contrary to the fervitude.

21. Perfonal fervitudes are thofe by which the property of a fubject is burdened, in favour, not of a tenement, but of a perfon. The only perfonal fervitude known in our law, is ufufruct or liferent; which is a right to ufe and enjoy a thing during life, the fubftance of it being preferved. A liferent cannot therefore be conftituted upon things which perifh in the ufe; and though it may upon fubjects which gradually wear out by time, as houfehold-furniture, *&c.* yet, with us, it is generally applied to heritable fubjects. He, whofe property is burdened, is ufually called the fiar.

22. Liferents are divided into conventional and legal. Conventional liferents are either fimple, or by refervation. A fimple liferent, or by a feparate conftitution, is that which is granted by the proprietor in favour of another: And this fort, contrary to the nature of predial fervitudes, requires feifin in order to affect fingular fucceffors; for a liferent of lands is, in ftrict fpeech, not a fervitude, but a right refembling property, which conftitutes the liferenter vaffal for life; and fingular fucceffors have no way of difcovering a liferent-right, which perhaps is not yet commenced, but by the records; whereas, in predial fervitudes, the conftant ufe of the dominant tenement makes them public. The proper right of liferent is intranfmiffible, *offibus ufufructuarii inhæret:* When the profits of the liferented fubject are tranfmitted to another, the right becomes merely perfonal, for it intitles the affignee to the rent, not during his own life, but his cedent's, and is therefore carried by fimple affignation, without feifin.

23. A liferent by refervation, is that which a proprietor referves to himfelf in the fame writing by which he conveys the fee to another. It requires no feifin; for the granter's former feifin, which virtually included the liferent, ftill fubfifts as to the liferent which is exprefsly referved. In conjunct infeftments taken to hufband and wife, the wife's right of conjunct fee refolves, in the general cafe, into a liferent.

24. Liferents by law, are the terce and the courtefy. The terce (*tertia*) is a liferent competent by law to widows, who have not accepted of fpecial provifions, in the third of the heritable fubjects, in which their hufbands died infeft; and takes place only where the marriage has fubfifted for year and day, or where a child has been born alive of it.

25. The terce is not limited to lands, but extends to teinds, and to fervitudes and other burdens affecting lands; thus, the widow is intitled, in the right of her terce, to a liferent of the third of the fums fecured, either by rights of annualrent, or by rights in fecurity. In improper wadfets, the terce is a third of the fum lent: In thofe that are proper, it is a third of the wadfet-lands; or in cafe of redemption, a third of the redemption money. Neither rights of reverfion, fuperiority, nor patronage, fall under the terce; for none of thefe have fixed profits, and fo are not proper fubjects for the widow's fubfiftence; nor tacks, becaufe they are not feudal rights. Burgage-tenements are alfo excluded from it, the reafon of which is not fo obvious Since the hufband's feifin is both the meafure and fecurity of the terce, fuch debts or diligences alone, as exclude the hufband's feifin, can prevail over it.

26. Where a terce is due out of lands burdened with

a prior terce ſtill ſubſiſting, the ſecond tercer has only right to a third of the two thirds that remain unaffected by the firſt terce. But upon the death of the firſt widow, whereby the lands are diſburdened of her terce, the leſſer terce becomes enlarged, as if the firſt had never exiſted. A widow, who has accepted of a ſpecial proviſion from her huſband, is thereby excluded from the terce, unleſs ſuch proviſion ſhall contain a clauſe that ſhe ſhall have right to both.

27. The widow has no title of poſſeſſion, and ſo cannot receive the rents in virtue of her terce, till ſhe be ſerved to it; and in order to this, ſhe muſt obtain a brief out of the chancery, directed to the Sheriff, who calls an inqueſt, to take proof that ſhe was wife to the deceaſed; and that the deceaſed died infeft in the ſubjects contained in the brief. The ſervice or ſentence of the jury, finding theſe points proved, does, without the neceſſity of a retour to the chancery, intitle the wife to enter into the poſſeſſion; but ſhe can only poſſeſs with the heir *pro indiviſo*, and ſo cannot remove tenants, till the ſheriff kens her to her terce, or divides the lands between her and the heir. In this diviſion, after determining by lot or kavil, whether to begin by the ſun or the ſhade, *i. e.* by the eaſt or the weſt, the ſheriff ſets off the two firſt acres for the heir, and the third for the widow. Sometimes the diviſion is executed, by giving one entire farm to the widow, and two of equal value to the heir. The widow's right is not properly conſtituted by this ſervice; it was conſtituted before, by the huſband's ſeiſin, and fixed by his death; the ſervice only declares it, and ſo intitles her to the third part of the rents *retro* to her huſband's death, preferable to any rights that may have affected the lands in the intermediate period between that and her own ſervice. The relict, if ſhe was reputed to be lawful wife to the deceaſed, muſt be ſerved, notwithſtanding any objections by the heir againſt the marriage, which may be afterwards tried by the commiſſary.

28. Courteſy is a liferent given by law, to the ſurviving huſband, of all his wife's heritage in which ſhe died infeft, if there was a child of the marriage born alive. A marriage, though of the longeſt continuance, gives no right to the courteſy, if there was no iſſue of it. The child born of the marriage muſt be the mother's heir: If ſhe had a child of a former marriage, who is to ſucceed to her eſtate, the huſband has no right to the courteſy while ſuch child is alive; ſo that the courteſy is due to the huſband, rather as father to an heir, than as huſband to an heireſs. Heritage is here oppoſed to conqueſt, and ſo is to be underſtood only of the heritable rights to which the wife ſucceeded as heir to her anceſtors, excluding what ſhe herſelf had acquired by ſingular titles.

29. Becauſe the huſband enjoys the liferent of his wife's whole heritage, on a lucrative title, he is conſidered as her temporary repreſentative, and ſo is liable in payment of all the yearly burdens chargeable on the ſubject, and of the current intereſt of all her debts, real and perſonal, to the value of the yearly rent he enjoys by the courteſy. The courteſy needs no ſolemnity to its conſtitution: That right, which the huſband had to the rents of his wife's eſtate, during the marriage, *jure mariti*, is continued with him after her death, under the name of courteſy, by an act of the law itſelf. As in the terce, the huſband's ſeiſin is the ground and meaſure of the wife's right; ſo in the courteſy, the wife's ſeiſin is the foundation of the huſband's; and the two rights are, in all other reſpects, of the ſame nature; if it is not that the courteſy extends to burgage holdings, and to ſuperiorities.

30. All liferenters muſt uſe their right *ſalva rei ſubſtantia*: Whatever therefore is part of the fee itſelf, cannot be encroached on by the liferenter, *e g.* woods or growing timber, even for the neceſſary uſes of the liferented tenement. But, where a coppice or *ſilva cædua* has been divided into hags, one of which was in uſe to be cut annually by the proprietor, the liferenter may continue the former yearly cuttings; becauſe theſe are conſidered as the annual fruits the ſubject was intended to yield, and ſo the proper ſubject of a liferent.

31. Liferenters are bound to keep the ſubject liferented in proper repair. They are alſo burdened with the alimony of the heir, where he has not enough for maintaining himſelf. The bare right of apparency founds the action againſt the liferenter. It is a burden perſonal to the liferenter himſelf, and cannot be thrown upon his adjudging creditors, as coming in his place by their diligences. Liferenters are alſo ſubjected to the payment of the yearly ceſſes, ſtipends, *&c.* falling due during their right, and to all other burdens that attend the ſubject liferented.

32. Liferent is extinguiſhed by the liferenter's death. That part of the rents which the liferenter had a proper right to, before his death, falls to his executors; the reſt, as never having been *in bonis* of the deceaſed, goes to the fiar. Martinmas and Whitſunday are, by our cuſtom, the legal terms of the payment of rent: Conſequently, if a liferenter of lands ſurvives the term of Whitſunday, his executors are intitled to the half of that year's rent, becauſe it was due the term before his death; and if he ſurvives the Martinmas, they have right to the whole. If the liferenter, being in the natural poſſeſſion, and having firſt ſowed the ground, ſhould die, even before the Whitſunday, his executors are intitled to the whole crop, in reſpect that both ſeed and induſtry were his. In a liferent of money conſtituted by a moveable bond, the executors have a right to the intereſt, down to the very day of the liferenter's death, where no terms are mentioned for the payment thereof; but in the caſe of an heritable bond, or of a money liferent ſecured on land, the intereſts of liferenter and fiar (or of heir and executor, for the ſame rules ſerve to fix the intereſts of both) are both governed by the legal terms of land-rent, without regard to the conventional.

Tit. 17. *Of Teinds.*

1. Teinds, or tithes, are that liquid proportion of our rents or goods, which is due to churchmen, for performing divine ſervice, or exerciſing the other ſpiritual functions proper to their ſeveral offices. Moſt of the canoniſts affirm, that the preciſe proportion of a tenth, not only of the fruits of the ground, but of what is acquired by perſonal induſtry, is due to the Chriſtian clergy, of divine right, which they therefore call the proper patrimony

trimony

trimony of the church; though it is certain that tithes, in their infancy, were given, not to the clergy alone, but to lay-monks who were called *pauperes*, and to other indigent persons. Charles the Great was the first secular Prince who acknowledged this right in the church. It appears to have been received with us, as far back as David I.

2. The person employed by a cathedral church or monastery to serve the cure in any church annexed, was called a vicar, because he held the church, not in his own right, but in the right or *vice* of his employers; and so was removeable at pleasure, and had no share of the benefice, other than what they thought fit to allow him: But, in the course of time, the appellation of vicar was limited to those who were made perpetual, and who got a stated share of the benefice for their incumbency; from whence arose the distinction of benefices into parsonages and vicarages.

3. Parsonage-teinds are the teinds of corn; and they are so called because they are due to the parson or other titular of the benefice. Vicarage-teinds are the small teinds of calves, lint, hemp, eggs, *&c.* which were commonly given by the titular to the vicar who served the cure in his place. The first sort was universally due, unless in the case of their infeudation to laics, or of a pontifical exemption; but, by the customs of almost all Christendom, the lesser teinds were not demanded where they had not been in use to be paid. By the practice of Scotland, the teinds of animals, or of things produced from animals, as lambs, wool, calves, are due though not accustomed to be paid; but roots, herbs, *&c.* are not tithable, unless use of payment be proved: neither are personal teinds, *i. e.* the tenth of what one acquires by his own industry, acknowledged by our law; yet they have been found due, when supported by 40 years possession.

4. The parson who was entitled to the teind of corns, made his right effectual either by accepting of a certain number of teind-bolls yearly from the proprietor, in satisfaction of it; or more frequently, by drawing or separating upon the field his own tenth part of the corns, after they were reaped, from the stock or the remaining nine tenths of the crop, and carrying it off to his own granaries; which is called drawn teind.

5. After the reformation, James VI. considered himself as proprietor of all the church-lands; partly because the purposes for which they had been granted were declared superstitious; and partly, in consequence of the resignations which he, and Q. Mary his mother, had procured from the beneficiaries: and even as to the teinds, tho' our reformed clergy also claimed them as the patrimony of the church, our sovereign did not submit to that doctrine farther than extended to a competent provision for ministers. He therefore erected or secularised several abbacies and priories into temporal lordships; the grantees of which were called sometimes lords of erection, and sometimes titulars, as having by their grants the same title to the erected benefices, that the monasteries had formerly.

6. As the Crown's revenue suffered greatly by these erections, the temporality of all church benefices (*i. e.* church lands) was, by 1587, *c.* 29. annexed to the crown. That statute excepts from the annexation such benefices as were established before the reformation in laymen, whose rights the legislature had no intention to weaken. Notwithstanding this statute, his Majesty continued to make farther erections, which were declared null by 1592, *c.* 119. with an exception of such as had been made in favour of lords of parliament, since the general act of annexation in 1587.

7. K. Charles I. soon after his succession, raised a reduction of all these erections, whether ganted before or after the act of annexation, upon the grounds mentioned at length by Mr Forbes in his treatise of tithes, p. 159. At last the whole matter was referred to the King himself by four several submissions or compromises, in which the parties on one side were the titulars and their tacksmen, the bishops with the inferior clergy, and the royal boroughs, for the interest they had in the teinds that were gifted for the provision of ministers, schools, or hospitals within their boroughs; and, on the other part, the proprietors who wanted to have the leading of their own teinds. The submission by the titulars contained a surrender into his Majesty's hands of the superiorities of their several erections.

8. Upon each of these submissions his Majesty pronounced separate decrees-arbitral, dated Sept. 2. 1629, which are subjoined to the acts of parliament of his reign. He made it lawful to proprietors to sue the titulars for a valuation, and if they thought fit for a sale also, of their teinds, before the commissioners named or to be named for that purpose. The rate of teind, when it was possessed by the proprietor jointly with the stock, for payment of a certain duty to the titular, and so did not admit a separate valuation, was fixed at a fifth part of the constant yearly rent, which was accounted a reasonable *surrogatum*, in place of a tenth of the increase. Where it was drawn by the titular, and consequently might be valued separately from the stock, it was to be valued as its extent should be ascertained upon a proof before the commissioners; but in this last valuation, the King directed the fifth part to be deducted from the proved teind, in favour of the proprietor, which was therefore called the King's ease. The proprietor suing for a valuation gets the leading of his own teinds as soon as his suit commences; providing he does not allow protestation to be extracted against him for not insisting.

9. Where the proprietor insisted also for a sale of his teinds, the titular was obliged to sell them at nine years purchase of the valued teind-duty. If the pursuer had a tack of his own teinds, not yet expired; or if the defender was only tacksmen of the teinds, and so could not give the pursuer an heritable right; an abatement of the price was to be granted accordingly by the commissioners.

10. There is no provision in the decrees-arbitral, for selling the teinds granted for the sustentation of ministers, universities, schools or hospitals; because these were to continue, as a perpetual fund, for the maintenance of the persons or societies to whom they were appropriated; and they are expresly declared not subject to sale, by 1690. *c.* 30.—1693, *c.* 23. By the last of these acts, it is also provided

vided, that the teinds belonging to bifhops, which had then fallen to the crown, upon the abolifhing of epifcopacy, fhould not be fubject to fale as long as they remained with the Crown not difpofed of; nor thofe which the the proprietor, who had right both to ftock and teind, referved to himfelf, in a fale or feu of the lands. But, though none of thefe teinds can be fold, they may be valued.

11. The King, by the decrees arbitral, declared his own right to the fuperiorities of erection which had been refigned to him by the fubmiffion, referving to the titulars the feu-duties thereof, until payment by himfelf to them of one thoufand merks Scots for every chalder of feu-victual, and for each hundred merks of feu-duty, which right of redeeming the feu-duties was afterwards renounced by the Crown. If the church-vaffal fhould confent to hold his lands of the titular, he cannot thereafter recur to the Crown as his immediate fuperior.

12. In explaining what the conftant rent is, by which the teind muft be valued, the following rules are obferved. The rent drawn by the proprietor, from the fale of fubjects, that are more properly parts of the land than of the fruits, *e. g.* quarries, minerals, moffes, *&c.* is to be deducted from the rental of the lands; and alfo the rent of fupernumerary houfes, over and above what is neceffary for agriculture; and the additional rent that may be paid by the tenant, in confideration of the proprietor's undertaking any burden that law impofes on the tenant, *e. g.* upholding the tenant's houfes, becaufe none of thefe articles are paid properly on account of the fruits. Orchards muft alfo be deducted, and mill-rent, becaufe the profits of a mill arife from induftry; and the corns manufactured there fuffer a valuation, as rent payable by the tenant; and therefore ought not to be valued a fecond time againft the titular as mill-rent. The yearly expence of culture ought not to be deducted; for no rent can be proudced without it: But, if an improvement of rent is made at an uncommon expence, *e. g.* by draining a lake, the proprietor is allowed a reafonable abatement on that account.

13. Notwithftanding the feveral ways of mifapplying parochial teinds in the times of popery, fome few benefices remained entire in the hands of the parfons. The minifters planted in thefe, after the reformation, continued to have the full right to them, as proper beneficiaries; but a power was afterwards granted to the patron, to redeem the whole teind from fuch beneficiaries, upon their getting a competent ftipend modified to them; which teind fo redeemed, the patron is obliged to fell to the proprietor, at fix years purchafe.

14. Some teinds are more directly fubject to an allocation for the minifter's ftipend, than others. The teinds, in the hands of the lay titular, fall firft to be allocated, who, fince he is not capable to ferve the cure in his own perfon, ought to provide one who can; and if the titular, in place of drawing the teind, has fet it in tack, the tack-duty is allocated: This fort is called free teind. Where the tack-duty, which is the titular's intereft in the teinds, falls fhort, the tack itfelf is burdened, or, in other words, the furplus teind over and above the tack-duty: But, in this cafe, the commiffioners are empowered to recompenfe the tackfman, by prorogating his tack for fuch a number of years as they fhall judge equitable. Where this likewife proves deficient, the allocation falls on the teinds, heritably conveyed by the titular, unlefs he has warranted his grant againft future augmentations; in which cafe, the teinds of the lands belonging in property to the titular himfelf muft be allocated in the firft place.

15. Where there is fufficiency of free teinds in a parifh, the titular may allocate any of them he fhall think fit for the minifter's ftipend, fince they are all his own; unlefs there has been a previous decree of locality: And this holds, though the ftipend fhould have been paid immemorially out of the teinds of certain particular lands. This right was frequently abufed by titulars, who, as foon as a proprietor had brought an action of fale of his teinds, allocated the purfuer's full teind for the ftipend, whereby fuch action became ineffectual: It was therefore provided, that after citation in a fale of teinds it fhall not be in the titular's power to allocate the purfuer's teinds folely, but only in proportion with the other teinds in the parifh.

16. Minifters glebes are declared free from the payment of teind. Lands *cum decimis inclufis* are alfo exempted from teind. But in order to exempt lands from payment of teind, it is neceffary that the proprietor prove his right thereto, *cum decimis inclufis*, as far back as the above act of annexation 1587.

17. Teinds are *debita fructuum*, not *fundi*. The action therefore for bygone teinds is only perfonal, againft thofe who have intermeddled, unlefs where the titular is infeft in the lands, in fecurity of the valued teind-duty. Where a tenant is, by his tack, bound to pay a joint duty to his landlord for ftock and teind, without diftinguifhing the rent of each, his defence of a *bona fide* payment of the whole to the landlord has been fuftained in a fuit at the inftance of a laic titular, but repelled where a churchman was purfuer. In both cafes the proprietor who receives fuch rent is liable as intermeddler.

18. In tacks of teinds, as of lands, there is place for tacit relocation; to ftop the effect of which, the titular muft obtain and execute an inhibition of teinds againft the tackfman, which differs much from inhibition of lands (explained under the next title), and is intended merely to interpel or inhibit the tackfman from farther intermeddling. This diligence of inhibition may alfo be ufed at the fuit of the titular, againft any other poffeffor of the teinds; and if the tackfman or poffeffor fhall intermeddle after the inhibition is executed, he is liable in a fpuilzie.

19. Lands and teinds pafs by different titles: A difpofition of lands therefore, though granted by one who has alfo right to the teind, will not carry the teind, unlefs it fhall appear from fpecial circumftances that a fale of both was defigned by the parties. In lands *cum decimis inclufis*, where the teinds are confolidated with the ftock, the right of both muft neceffarily go together in all cafes.

Tit. 18. *Of Inhibitions.*

The conftitution and tranfmiffion of feudal rights being explained,

explained, and the burdens with which they are chargeable, it remains to be confidered, how thefe rights may be affected at the fuit of creditors, by legal diligence. Diligences are certain forms of law, whereby a creditor endeavours to make good his payment, either by affecting the perfon of his debtor, or by fecuring the fubjects belonging to him from alienation, or by carrying the property of thefe fubjects to himfelf. They are either real or perfonal. Real diligence is that which is proper to heritable or real rights; perfonal, is that by which the perfon of the debtor may be fecured, or his perfonal eftate affected. Of the firft fort we have two, *viz.* Inhibition and Adjudication.

2. Inhibition is a perfonal prohibition, which paffes by letters under the fignet, prohibiting the party inhibited to contract any debt, or do any deed, by which any part of his lands may be aliened or carried off, in prejudice of the creditor inhibiting. It muft be executed againft the debtor, perfonally, or at his dwelling houfe, as fummonfes, and thereafter publifhed and regiftred in the fame manner with interdictions, (fee Tit. vii. 30.)

3. Inhibition may proceed, either upon a liquid obligation, or even on an action commenced by a creditor for making good a claim not yet fuftained by the judge; which laft is called inhibition upon a depending action. The fummons, which conftitutes the dependence, muft be executed againft the debtor before the letters of inhibition pafs the fignet; for no fuit can be faid to depend againft one, till he be cited in it as a defender: But the effect of fuch inhibition is fufpended, till decree be obtained in the action againft the debtor; and in the fame manner, inhibitions on conditional debts have no effect, till the condition be purified. Inhibitions are not granted, without a trial of the caufe, when they proceed on conditional debts. And though, in other cafes, inhibitions now pafs of courfe, the Lords are in ufe to ftay, or recal them, either on the debtor's fhewing caufe why the diligence fhould not proceed, or even *ex officio* where the ground of the diligence is doubtful.

4. Though inhibitions, by their uniform ftyle, difable the debtor from felling his moveable as well as his heritable eftate, their effect has been long limited to heritage, from the interruption that fuch an embargo upon moveables muft have given to commerce; fo that debts contracted after inhibition may be the foundation of diligence, againft the debtor's perfon and moveable eftate. An inhibition fecures the inhibiter againft the alienation, not only of the lands that belonged to his debtor when he was inhibited, but of thofe that he fhall afterwards acquire; but no inhibition can extend to fuch after-purchafes as lie in a jurifdiction where the inhibition was not regiftred; for it could not have extended to thefe, tho' they had been made prior to the inhibition.

5. This diligence only ftrikes againft the voluntary debts or deeds of the inhibited perfon: It does not reftrain him from granting neceffary deeds, *i. e.* fuch as he was obliged to grant anterior to the inhibition, fince he might have been compelled to grant thefe before the inhibiter had acquired any right by his diligence. By this rule, a wadfetter or annualrenter might, after being inhibited, have effectually renounced his right to the reverfer on payment, becaufe law could have compelled him to it; but to fecure inhibiters againft the effect of fuch alienations, it is declared by act of federunt of the court of Seffion, Feb. 19. 1680, that, after intimation of the inhibition to the reverfer, no renunciation or grant of redemption fhall be fuftained, except upon declarator of redemption brought by him, to which the inhibiter muft be made a party.

6. An inhibition is a diligence fimply prohibitory, fo that the debt, on which it proceeds, continues perfonal after the diligence; and confequently, the inhibitor, in a queftion with anterior creditors whofe debts are not ftruck at by the inhibition, is only preferable from the period at which his debt is made real by adjudication: And where debts are contracted on heritable fecurity, though pofterior to the inhibition, the inhibiter's debt, being perfonal, cannot be ranked with them; he only draws back from the creditors ranked the fums contained in his diligence. The heir of the perfon inhibited is not reftrained from alienation, by the diligence ufed againft his anceftor; for the prohibition is perfonal, affecting only the debtor againft whom the diligence is ufed.

7. Inhibitions do not, of themfelves, make void the pofterior debts or deeds of the perfon inhibited; they only afford a title to the ufer of the diligence to fet them afide, if he finds them hurtful to him: And even where a debt is actually reduced *ex capite inhibitionis*, fuch reduction, being founded folely in the inhibiter's intereft, is profitable to him alone, and cannot alter the natural preference of the other creditors.

8. Inhibitions may be reduced, upon legal nullities, arifing either from the ground of debt, or the form of diligence. When payment is made by the debtor to the inhibiter, the inhibition is faid to be purged. Any creditor, whofe debt is ftruck at by the inhibition, may, upon making payment to the inhibiter, compel him to affign the debt and diligence in his favour, that he may make good his payment the more effectually againft the common debtor.

Tit. 19. *Of Comprifings, Adjudications, and Judicial Sales.*

Heritable rights may be carried from the debtor to the creditor, either by the diligence of apprifing (now adjudication), or by a judicial fale carried on before the court of Seffion. Apprifing, or comprifing, was the fentence of a fheriff, or of a meffenger who was fpecially conftituted fheriff for that purpofe, by which the heritable rights belonging to the debtor were fold for payment of the debt due to the apprifer; fo that apprifings were, by their original conftitution, proper fales of the debtor's lands, to any purchafer who offered. If no purchafer could be found, the fheriff was to apprife or tax the value of the lands by an inqueft, (whence came the name of apprifing), and to make over to the creditor lands to the value of the debt.

2. That creditors may have accefs to affect the eftate of their deceafed debtor, though the heir fhould ftand off from entering, it is made lawful (by 1540, *c.* 106.) for any creditor to charge the heir of his debtor to enter to his anceftor,

year

year and day being paſt after the anceſtor's death, within forty days after the charge; and, if the heir fails, the creditor may proceed to appriſe his debtor's lands, as if the heir had been entered. Cuſtom has ſo explained this ſtatute, that the creditor may charge the heir, immediately after the death of his anceſtor, provided letters of appriſing be not raiſed till after the expiry both of the year and of the forty days next enſuing the year, within which the heir is charged to enter. But this ſtatute relates only to ſuch charges on which appriſing is to be led againſt the anceſtor's lands; for, in thoſe which are to be barely the foundation of a common ſummons or proceſs againſt the heir, action will be ſuſtained if the year be elapſed from the anceſtor's death before the execution of the ſummons, though the forty days ſhould not be alſo expired. Though the ſtatute authoriſes ſuch charges againſt majors only, practice has alſo extended it againſt minors, and the rule is extended to the caſe where the heir is the debtor. One muſt, in this matter, diſtinguiſh between a general and a ſpecial charge. A general charge ſerves only to fix the repreſentation of the heir who is charged, ſo as to make the debt his, which was formerly his anceſtor's: But a ſpecial charge makes up for the want of a ſervice, explained Tit. xxvii. 25. and ſtates the heir, *fictione juris*, in the right of the ſubjects to which he is charged to enter. Where therefore the heir is the debtor, a general charge for fixing the repreſentation againſt him is unneceſſary, ſince the only concern of the creditor is, that his debtor make up titles to the anceſtor's eſtate, which is done by a ſpecial charge: But where the deceaſed was the debtor, the creditor muſt firſt charge his heir to enter in general, that it may be known whether he is to repreſent the debtor; if he does not enter within forty days, the debt may be fixed againſt him by a decree of conſtitution, on which he muſt be charged to enter heir in ſpecial, upon forty days more; and theſe muſt be elapſed before the creditor can proceed to appriſe.

3. Appriſings in courſe of time underwent ſeveral changes in their form and effect, till at length, by act 1672, *c.* 19. adjudications were ſubſtituted in their place, which directed to proceed againſt debtors by way of action before the court of Seſſion. By that ſtatute, ſuch part of the debtor's lands is to be adjudged as is equivalent to the principal ſum and intereſt of the debt, with the compoſition due to the ſuperior and expences of infeftment, and a fifth part more in reſpect the creditor is obliged to take land for his money. The debtor muſt deliver to the creditor a valid right of the lands to be adjudged, or tranſumpts thereof, renounce the poſſeſſion in his favour, and ratify the decree of adjudication: And law conſiders the rent of the lands as preciſely commenſurated to the intereſt of the debt; ſo that the adjudger lies under no obligation to account for the ſurplus rents. In this, which is called a ſpecial adjudication, the legal or time within which the debtor may redeem, is declared to be five years; and the creditor attaining poſſeſſion upon it can uſe no farther execution againſt the debtor, unleſs the lands be evicted from him.

4. Where the debtor does not produce a ſufficient right to the lands, or is not willing to renounce the poſſeſſion, and ratify the decree, (which is the caſe that has moſt frequently happened), the ſtatute makes it lawful for the creditor to adjudge all right belonging to the debtor in the ſame manner, and under the ſame reverſion of ten years, as he could, by the former laws, have appriſed it. In this laſt kind, which is called a general adjudication, the creditor muſt limit his claim to the principal ſum, intereſt, and penalty, without demanding a fifth part more. But no general adjudication can be inſiſted on, without libelling in the ſummons the other alternative of a ſpecial adjudication; for ſpecial adjudications are introduced by the ſtatute in the place of appriſings; and it is only where the debtor refuſes to comply with the terms thereof that the creditor can lead a general adjudication.

5. Abbreviates are ordained to be made of all adjudications, which muſt be recorded within ſixty days after the date of the decree. In every other reſpect, general adjudications have the ſame effects that appriſings had; adjudgers in poſſeſſion are accountable for the ſurplus rents; a citation in adjudications renders the ſubject litigious; ſuperiors are obliged to enter adjudgers; the legal of adjudications does not expire during the debtor's minority, *&c.* Only it may be obſerved, that though appriſings could not proceed before the term of payment, yet where the debtor is *vergens ad inopiam*, the court *ex nobili officio* admit adjudication for the debt before it be payable. But this ſort being founded ſolely in equity, ſubſiſts merely as a ſecurity, and cannot carry the property to the creditor by any length of time.

6. There are two kinds of adjudication, which took place at the ſame time with appriſings, and ſtill obtain; *viz.* adjudications on a decree *cognitionis cauſa*, otherwiſe called *contra hereditatem jacentem*, and adjudications in implement. Where the debtor's apparent heir, who is charged to enter, formally renounces the ſucceſſion, the creditor may obtain a decree *cognitionis cauſa;* in which, though the heir renouncing is cited for the ſake of form, no ſentence condemnatory can be pronounced againſt him, in reſpect of his renunciation; the only effect of it is to ſubject the *hereditas jacens* to the creditor's diligence.

7. Adjudications *contra hereditatem jacentem*, carry not only the lands themſelves that belonged to the deceaſed, but the rents thereof fallen due ſince his death; for theſe, as an acceſſory to the eſtate belonging to the deceaſed, would have deſcended to the heir if he had entered, which rule is applied to all adjudications led on a ſpecial charge. This ſort of adjudication is declared redeemable within ſeven years, by any co-adjudging creditor, either of the deceaſed debtor, or of the heir renouncing. The heir himſelf, who renounces, cannot be reſtored againſt his renunciation, nor conſequently redeem, if he be not a minor. But even a major may redeem indirectly, by granting a ſimulate bond to a confident perſon; the adjudication upon which, when conveyed to himſelf, is a good title to redeem all other adjudications againſt the lands belonging to his anceſtor.

8. Adjudications in implement are deduced againſt thoſe who have granted deeds without procuratory of reſignation or precept of ſeiſin, and refuſe to diveſt themſelves; to

to the end that the ſubject conveyed may be effectually veſted in the grantee. Theſe adjudications may be alſo directed againſt the heir of the granter, upon a charge to enter. Here there is no place for a legal reverſion; for, as the adjudication is led for completing the right of a ſpecial ſubject, it muſt carry that ſubject as irredeemably as if the right had been voluntarily completed.

9. All adjudications led within year and day of that one which has been made firſt effectual by ſeiſin (where ſeiſin is neceſſary) or exact diligence for obtaining ſeiſin, are preferable *pari paſſu*. The year and day runs from the date of the adjudication, and not of the ſeiſin or diligence for obtaining it. After the days of that period, they are preferable according the their dates. All the co adjudgers within the year are preferable *pari paſſu* as if one adjudication had been led for all their debts. This makes the ſeiſin or diligence on the firſt adjudication a common right to the reſt, who muſt therefore be refund to the owner of that diligence his whole expence laid out in carrying on and completing it. And though that firſt adjudication ſhould be redeemed, the diligence upon it ſtill ſubſiſts as to the reſt. This *pari paſſu* preference, however, does not deſtroy the legal preference of adjudications led on *debita fundi*. See Tit. xv. 15. Nor does it take place in adjudications in implement.

10. Before treating of judicial ſales of bankrupts eſtates, the nature of ſequeſtration may be ſhortly explained, which is a diligence that generally uſhers in actions of ſale. Sequeſtration of lands is a judicial act of the court of Seſſion, whereby the management of an eſtate is put into the hands of a factor or ſteward named by the court, who gives ſecurity, and is to be accountable for the rents to all having intereſt. This diligence is competent, either where the right of the lands is doubtful, if it be applied for before either of the competitors has attained poſſeſſion; or where the eſtate is heavily charged with the debts: But, as it is an unfavourable diligence, it is not admitted, unleſs that meaſure ſhall appear neceſſary for the ſecurity of creditors. Subjects, not brought before the court by the diligence of creditors, cannot fall under ſequeſtration; for it is the competition of creditors which alone founds the juriſdiction of the court to take the diſputed ſubject into their poſſeſſion.

11. The court of Seſſion who decrees the ſequeſtration has the nomination of the factor, in which they are directed by the recommendation of the creditors. A factor appointed by the Seſſion, though the proprietor had not been infeft in the lands, has a power to remove tenants. Judicial factors muſt, within ſix months after extracting their factory, make up a rental of the eſtate, and a liſt of the arrears due by tenants, to be put into the hands of the clerk of the proceſs, as a charge againſt themſelves, and a note of ſuch alterations in the rental as may afterwards happen; and muſt alſo deliver to the clerk annually a ſcheme of their accounts, charge and diſcharge, under heavy penalties. They are, by the nature of their office, bound to the ſame degree of diligence that a prudent man adhibits in his own affairs; they are accountable for the intereſt of the rents, which they either have, or by diligence might have recovered, from a year after their falling due. As it is much in the power of thoſe factors to take advantage of the neceſſities of creditors, by purchaſing their debts at an undervalue, all ſuch purchaſes made either by the factor himſelf, or to his behoof, are declared equivalent to an acquitance or extinction of the debt. No factor can warrantably pay to any creditor, without an order of the court of Seſſion; for he is, by the tenor of his commiſſion, directed to pay the rents to thoſe who ſhall be found to have beſt right to them. Judicial factors are intitled to a ſalary, which is generally ſtated at five *per cent.* of their intromiſſions; but it is ſeldom aſcertained till their office expires, or till their accounting; that the court may modify a greater or ſmaller ſalary, or none, in proportion to the factor's integrity and diligence. Many caſes occur, where the court of Seſſion, without ſequeſtration, name a factor to preſerve the rents from periſhing; *e. g.* where an heir is deliberating whether to enter, where a minor is without tutors, where a ſucceſſion opens to a perſon reſiding abroad; in all which caſes, the factor is ſubjected to the rules laid down in act of ſederunt, Feb. 13. 1730.

12. The word *bankrupt* is ſometimes applied to perſons whoſe funds are not ſufficient for their debts; and ſometimes, not to the debtor, but to his eſtate. The court of Seſſion are empowered, at the ſuit of any real creditor, to try the value of a bankrupt's eſtate, and ſell it for the payment of his debts.

13. No proceſs of ſale, at the ſuit of a creditor, can proceed without a proof of the debtor's bankruptcy, or at leaſt that his lands are ſo charged with debts, that no prudent perſons will buy from him; and therefore the ſummons of ſale muſt comprehend the debtor's whole eſtate. The debtor, or his apparent heir, and all the real creditors in poſſeſſion, muſt be made parties to the ſuit; but it is ſufficient if the other creditors be called by an edictal citation. The ſummons of ſale contains a concluſion of ranking or preference of the bankrupt's creditors. In this ranking, firſt and ſecond terms are aſſigned to the whole creditors for exhibiting in court (or producing) their rights and diligences; and the decree of certification proceeding thereupon, againſt the writings not produced, has the ſame effect in favour of the creditors who have produced their rights, as if that decree had proceeded upon an action of reduction-improbation. See Tit xxx. 5. The ranking of theſe creditors muſt be concluded by an extracted decree, before the actual ſale. The irredeemable property of the lands is adjudged by the court to the higheſt offerer at the ſale. The creditors receiving payment muſt grant to the purchaſer abſolute warrandice, to the extent of the ſum received by them; and the lands purchaſed are declared diſburdened of all debts or deeds of the bankrupt, or his anceſtors, either on payment of the price by the purchaſer to the creditors according to their preference, or on conſignation of it, in caſe of their refuſal, in the hands of the magiſtrates of Edinburgh: The only remedy provided to ſuch creditors as judge themſelves hurt by the ſale of diviſion of the price, even though they ſhould be minors, is an action for recovering their ſhare of the price againſt the creditors who have received it.

14. The expence of theſe proceſſes is diſburſed by the factor out of the rents in his hands; by which the whole

whole burden of such expence falls upon the posterior creditors.

15. Apparent heirs are intitled to bring actions of sale of the estates belonging to their ancestors, whether bankrupt or not; the expence of which ought to fall upon the pursuer, if there is any excrescence of the price, after payment of the creditors.

16. As processes of ranking and sale are designed for the common interest of all the creditors, no diligence carried on or completed during their pendency ought to give any preference in the competition; *pendente lite, nihil innovandum*.

17. It is a rule in all real diligences, that where a creditor is preferable on several different subjects, he cannot use his preference arbitrarily, by favouring one creditor more than another; but must allocate his universal or catholic debt proportionally against all the subjects or parties whom it affects. If it is material to such creditor to draw his whole payment out of any one fund, he may apply his debt so as may best secure himself; but that inequality will be rectified, as to the posterior creditors, who had likewise, by their rights and diligences, affected the subjects out of which he drew his payment, by obliging him to assign in their favour his right upon the separate subjects which he did not use in the ranking; by which they may recur against these separate subjects for the shares which the debt preferred might have drawn out of them. As the obligation to assign is founded merely in equity, the catholic creditor cannot be compelled to it, if his assigning shall weaken the preference of any separate debt vested in himself, affecting the special subject sought to be assigned. But if a creditor upon a special subject shall acquire from another a catholic right, or a catholic creditor shall purchase a debt affecting a special subject, with a view of creating to the special debt a higher degree of preference than was naturally due to it, by an arbitrary application of the catholic debt, equity cannot protect him from assigning in favour of the creditor excluded by such application, especially if, prior to the purchase, the subject had become litigious by the process of ranking; for transmissions ought not to hurt creditors who are no parties to them, nor to give the purchaser any new right, which was not formerly in himself or his cedent.

Tit. 20. *Of Obligations and Contracts in general.*

The law of heritable rights being explained, moveable rights fall next to be considered, the doctrine of which depends chiefly on the nature of Obligations. An obligation is a legal tie, by which one is bound to pay or perform something to another. Every obligation on the person obliged, implies an opposite right in the creditor, so that what is a burden in regard to the one is right with respect to the other; and all rights founded on obligation are called personal. There is this essential difference between a real and a personal right, that a *jus in re*, whether of property, or of an inferior kind as servitude, entitles the person vested with it to possess the subject as his own; or if he is not in possession, to demand it from the possessors; whereas the creditor in a personal right has only *jus ad rem*, or a right to compel the debtor to fulfil his obligation; without any right in the subject itself, which the debtor is bound to transfer to him. One cannot oblige himself, but by a present act of the will. A bare resolution therefore, or purpose to be obliged, is alterable at pleasure.

2. Obligations are either, first, merely natural, where one person is bound to another by the law of nature, but cannot be compelled by any civil action to the performance. Thus, though deeds granted by a minor having curators, without their consent, are null, yet the minor is naturally obliged to perform such deeds; and parents are naturally obliged to provide their children in reasonable patrimonies. Natural obligations intitle the creditor to retain what he has got in virtue thereof, without being subjected to restore it. 2. Obligations are merely civil, which may be sued upon by an action, but are elided by an exception in equity; this is the case of obligations granted through force or fear, *&c*. 3. Proper or full obligations, are those which are supported both by equity and the civil sanction.

3. Obligations may be also divided into, 1. Pure, to which neither day nor condition is adjected. These may be exacted immediately. 2. Obligations (*ex die*), which have a day adjected to their performance. In these, *dies statem cedit, sed non venit;* a proper debt arises from the date of the obligation, because it is certain that the day will exist; but the execution is suspended, till the lapse of that day. 3. Conditional obligations; in which there is no proper debt (*dies non cedit*) till the condition be purified, because it is possible the condition may exist; and which therefore are said to create only the hope of a debt; but the granter, even of these, has no right to resile. An obligation, to which a day is adjected that possibly may never exist, implies a condition; *dies incertus pro conditione habetur*. Thus, in the case of a provision to a child, payable when he attains to the age of fourteen, if the child dies before that age, the provision falls.

4. Obligations, when considered with regard to their cause, were divided by the Romans, into those arising from contract, quasi contract, delict, and quasi delict: But there are certain obligations, even full and proper ones, which cannot be derived from any of these sources, and to which Lord Stair gives the name of obediential. Such as the obligation on parents to aliment or maintain their children; which arises singly from the relation of parent and child, and may be enforced by the civil magistrate. Under parents are comprended the mother, grandfather, and grandmother, in their proper order. This obligation on parents extends to the providing of their issue in all the necessaries of life, and giving them suitable education. It ceases, when the children can earn a livelyhood by their own industry; but the obligation on parents to maintain their indigent children, and reciprocally on children to maintain their indigent parents, is perpetual. This obligation is, on the father's death, transferred to the eldest son, the heir of the family; who, as representing the father, must aliment his younger brothers and sisters: The brothers are only intitled to alimony, till their age of twenty-one, after which they are presumed able to do for themselves; but the obligation to

to maintain the fifters continues till their marriage. In perfous of lower rank, the obligation to aliment the fifters ceafes after they are capable of fubfifting by any fervice or employment.

5. All obligations, arifing from the natural duty of reftitution, fall under this clafs: Thus, things given upon the view of a certain event, muft be reftored, if that event does not afterwards exift: Thus alfo, things given *ob turpem caufam*, where the turpitude is in the receiver and not in the giver, muft be reftored. And on the fame principle, one upon whofe ground a houfe is built or repaired by another, is obliged, without any covenant, to reftore the expence laid out upon it, in fo far as it has been profitable to him.

6. A contract is the voluntary agreement of two or more perfons, whereby fomething is to be given or performed upon one part, for a valuable confideration, either prefent or future, on the other part. Confent, which is implied in agreement, is excluded, 1. By error in the effentials of the contract, for in fuch cafe, the party does not properly contract, but errs or is deceived; And this may be alfo applied to contracts which take their rife from fraud or impofition. 2. Confent is excluded by fuch a degree of reftraint upon any of the contracting parties, as extorts the agreement; for where violence or threatening are ufed againft a perfon, his will has really no part in the contract.

7. Loan or *mutuum* is that contract which obliges a perfon, who has borrowed any fungible fubject from another, to reftore to him as much of the fame kind, and of equal goodnefs. Whatever receives its eftimation in number, weight, or meafure, is a fungible, as corn, wine, current coin, *&c*. The only proper fubjects of this contract are things which cannot be ufed, without either their extinction or alienation; hence, the property of the thing lent is neceffarily transferred by delivery to the borrower, who confequently muft run all the hazards, either of its deterioration or its perifhing, according to the rule, *res perit fuo domino*. Where the borrower neglects to reftore, at the time and place agreed on, the eftimation of the thing lent muft be made according to its price at that time and in that place; becaufe it would have been worth fo much to the lender, if the obligation had been duly performed. If there is no place nor time ftipulated for, the value is to be ftated according to the price that the commodity gave when and where it was demanded. In the loan of money, the value put on it by public authority, and not its intrinfic worth, is to be confidered. This contract is obligatory only on one part; for the lender is fubjected to no obligation: The only action therefore that it produces, is pointed againft the borrower, that he may reftore as much in quantity and quality as he borrowed, together with the damage the lender may have fuffered through default of due performance.

8. Commodate is a fpecies of loan, gratuitous on the part of the lender, where the thing lent may be ufed, without either its perifhing or its alienation. Hence, in this fort of loan, the property continues with the lender: the only right the borrower acquires in the fubject is its ufe, after which he muft reftore the individual thing that he borrowed: Confequently, if the fubject perifhes, it perifhes to the lender, unlefs it has perifhed by the borrower's fault. What degree of fault or negligence makes either of the contracting parties liable to the other in damages, is comprehended under the following rules. Where the contract gives a mutual benefit to both parties, each contracter is bound to adhibit a middle fort of diligence, fuch as a man of ordinary prudence ufes in his affairs. Where only one of the parties has benefit by the contract, that party muft ufe exact diligence; and the other who has no advantage by it is accountable only for dole, or for grofs omiffions which the law conftrues to be dole. Where one employs lefs care on the fubject of any contract which implies an exuberant truft, than he is known to employ in his own affairs, it is confidered as dole.

9. By thefe rules, the borrower in the contract of commodate muft be exactly careful of the thing lent, and reftore it at the time fixed by the contract, or after that ufe is made of it for which it was lent: If he puts it to any other ufe, or neglects to reftore it at the time covenanted, and if the thing perifhes thereafter, even by mere accident, he is bound to pay the value. On the other part, the lender is obliged to reftore to the borrower fuch of the expences difburfed by him on that fubject, as arofe from any uncommon accident, but not thofe that naturally attend the ufe of it. Where a thing is lent gratuoufly, without fpecifying any time of redelivery, it conftitutes the contract of *precarium*, which is revokable at the lender's pleafure, and, being entered into from a perfonal regard to the borrower, ceafes by his death.

10. Depofitation is a contract, by which one who has the cuftody of a thing committed to him (the depofitary), is obliged to reftore it to the depofitar. If a reward is bargained for by the depofitary for his care, it refolves into the contract of location. As this contract is gratuitous, the depofitary is only anfwerable for the confequences of grofs neglect; but after the depofit is redemanded, he is accountable even for cafual misfortunes. He is intitled to a full indemnification for the loffes he has fuftained by the contract, and to the recovery of all fums expended by him on the fubject.

11. An obligation arifes without formal paction, barely by a traveller's entering into an inn, fhip, or ftable, and there depofiting his goods, or putting up his horfes; whereby the innkeeper, fhipmafter, or ftabler, is accountable, not only for his own facts and thofe of his fervants, (which is an obligation implied in the very exercife of thefe employments), but of the other guefts or paffengers; and, indeed, in every cafe, unlefs where the goods have been loft *damno fatali*, or carried off by pirates or houfebreakers. Not only the mafters of fhips but their employers, are liable each of them for the fhare that he has in the fhip; but by the prefent cuftom of trading nations, the goods brought into a fhip muft have been delivered to the mafter or mate, or entered into the fhip-books. Carriers fall within the intendment of this law; and practice has extended it to vintners within borough. The extent of the damage fuftained by the party may be proved by his own oath *in litem*.

12. Sequeftration, whether voluntarily confented to by the parties, or authorifed by the judge, is a kind of depofit;

depoſit; but as the office of ſequeſtree, to whoſe care the ſubject in diſpute is committed, is not conſidered as gratuitous, he cannot throw it up at pleaſure, as a common depoſitary may do; and he is liable in the middle degree of diligence. Conſignation of money is alſo a depoſit. It may be made, either where the debt is called in queſtion by the debtor, as in ſuſpenſions; or where the creditor refuſes to receive his money, as in wadſets, *&c.* The riſk of the conſigned money lies on the conſigner, where he ought to have made payment, and not conſignation, or has conſigned only a part; or has choſen for conſignatory, a perſon neither named by the parties nor of good credit. The charger, or other creditor, runs the riſk, if he has charged for ſums not due, or has without good reaſon refuſed payment, by which refuſal the conſignation became neceſſary. It is the office of a conſignatory, to keep the money in ſafe cuſtody, till it be called for: If therefore he puts it out at intereſt, he muſt run the hazard of the debtor's inſolvency; but, for the ſame reaſon, though he ſhould draw intereſt for it, he is liable in none to the conſigner.

13. Pledge, when oppoſed to wadſet, is a contract, by which a debtor puts into the hands of his creditor a ſpecial moveable ſubject in ſecurity of the debt, to be redelivered on payment. Where a ſecurity is eſtabliſhed by law to the creditor, upon a ſubject which continues in the debtor's poſſeſſion, it has the ſpecial name of an hypothec. Tradeſmen and ſhip-carpenters have an hypothec on the houſe or ſhip repaired, for the materials and other charges of reparation; but not for the expence of building a new ſhip. Owners of ſhips have an hypothec on the cargo for the freight, heritors on the fruits of the ground, and landlords on the *invecta et illata*, for their rents. Writers alſo, and agents, have a right of hypothec, or more properly of retention, in their conſtituent's writings, for their claim of pains and diſburſements. A creditor cannot, for his own payment, ſell the ſubject impignorated, without applying to the judge-ordinary for a warrant to put it up to public ſale or roup; and to this application the debtor ought to be made a party.

Tit. 21. *Of Obligations by Word or Writ.*

THE appellation of *verbal* may be applied to all obligations to the conſtitution of which writing is not eſſential, which includes both real and conſenſual contracts; but as theſe are explained under ſeparate titles, obligations *by word*, in the ſenſe of this rubric, muſt be reſtricted, either to promiſes, or to ſuch verbal agreements as have no ſpecial name to diſtinguiſh them. Agreement implies the intervention of two different parties, who come under mutual obligations to one another. Where nothing is to be given or performed but on one part, it is properly called a promiſe, which, as it is gratuitous, does not require the acceptance of him to whom the promiſe is made. An offer, which muſt be diſtinguiſhed from a promiſe, implies ſomething to be done by the other party; and conſequently is not binding on the offerer, till it be accepted, with its limitations or conditions, by him to whom the offer is made; after which, it becomes a proper agreement.

2. Writing muſt neceſſarily intervene in all obligations and bargains concerning heritable ſubjects, though they ſhould be only temporary; as tacks, which, when they are verbal, laſt but for one year. In theſe no verbal agreement is binding, though it ſhould be referred to the oath of the party; for, till writing is adhibited, law gives both parties a right to reſile, as from an unfiniſhed bargain; which is called *locus pœnitentiæ*. If, upon a verbal bargain of lands, part of the price ſhall be paid by him who was to purchaſe, the *interventus rei*, the actual payment of money, creates a valid obligation, and gives a beginning to the contract of ſale: And in general, where-ever matters are no longer entire, the right to reſile ſeems to be excluded. An agreement, whereby a real right is paſſed from, or reſtricted, called *pactum liberatorium*, may be perfected verbally; for freedom is favourable, and the purpoſe of ſuch agreement is rather to diſſolve than to create an obligation. Writing is alſo eſſential to bargains made under condition that they ſhall be reduced into writing; for in ſuch caſes, it is *pars contractus*, that, till writing be adhibited, both parties ſhall have liberty to withdraw. In the ſame manner, verbal or nuncupative teſtaments are rejected by our law; but verbal legacies are ſuſtained, where they do not exceed *L.* 100 *Scots*.

3. Anciently, when writing was little uſed, deeds were executed by the party appending his ſeal to them; in preſence of witneſſes. For preventing frauds that might happen by appending ſeals to falſe deeds, the ſubſcription alſo of the granter was afterwards required, and, if he could not write, that of a notary. As it might be of dangerous conſequence, to give full force to the ſubſcription of the parties by initials, which is more eaſily counterfeited; our practice, in order to ſuſtain ſuch ſubſcription, ſeems to require a proof, not only that the granter uſed to ſubſcribe in that way, but that *de facto* he had ſubſcribed the deed in queſtion; at leaſt, ſuch proof is required, if the inſtrumentary witneſſes be ſtill alive.

4. As a further check, it was afterwards provided that all writings carrying any heritable right, and other deeds of importance, be ſubſcribed by the principal parties, if they can ſubſcribe; otherwiſe, by two notaries, before four witneſſes ſpecially deſigned. The ſubſequent practice extended this requiſite of the deſignation of the witneſſes to the caſe where the parties themſelves ſubſcribed. Cuſtom has conſtrued obligations for ſums exceeding *L.* 100 *Scots*, to be obligations of importance. In a diviſible obligation, *ex. gr.* for a ſum of money, though exceeding *L.* 100, the ſubſcription of one notary is ſufficient, if the creditor reſtricts his claim to *L.* 100: But, in an obligation indiviſible, *e. g.* for the performance of a fact, if it be not ſubſcribed in terms of the ſtatute, it is void. When notaries thus atteſt a deed, the atteſtation or docquet muſt ſpecially expreſs that the granter gave them a mandate to ſign; nor is it ſufficient that this be mentioned in the body of the writing.

5. In every deed, the name of him who writes it, with his dwelling place or other mark of diſtinction, muſt be inſerted. The witneſſes muſt both ſubſcribe as witneſſes, and their names and deſignations be inſerted in the body of the deed: And all ſubſcribing witneſſes muſt know the granter, and either ſee him ſubſcribe, or hear him

him acknowledge his fubfcription; otherwife they are declared punifhable as acceffory to forgery. Deeds, decrees, and other fecurities, confifting of more than one fheet, may be written by way of book, in place of the former cuftom of pafting together the feveral fheets, and figning the joinings on the margin; provided each page be figned by the granter, and marked by its number; and the tefting claufe exprefs the number of pages.

6. Inftruments of feifin are valid, if fubfcribed by one notary, before a reafonable number of witneffes; which is extended by practice to inftruments of refignation. Two witneffes are deemed a reafonable number to every deed that can be executed by one notary. It is not neceffary, that the witneffes to a notorial inftrument, or execution, fee the notary or meffenger fign; for they are called as witneffes to the tranfaction which is attefted, and not to the fubfcription of the perfon attefting.

7. A new requifite has been added to certain deeds fince the union, for the benefit of the revenue: They muft be executed on ftamped paper, or parchment, paying a certain duty to the crown. Charters, inftruments of refignation, feifins, and retours of lands holden of a fubject, are charged with 2 *s.* 3 *d.* of duty: Bonds, tacks, contracts, and other perfonal obligations, paid at firft 6 *d.* to which a farther duty of 1 *s.* has been fince added. Bail-bonds, bills, teftaments, difcharges, or acquittances of rent or of intereft and judicial deeds, as notorial inftruments, bonds of cautionry in fufpenfions, *&c.* are excepted.

8. The granter's name and defignation are effential, not properly as folemnities, but becaufe no writing can have effect without them. Bonds were, by our ancient practice, frequently executed without filling up the creditor's name; and they paffed from hand to hand, like notes payable to the bearer: But as there was no method for the creditor of a perfon poffeffed of thefe to fecure them for his payment, all writings taken blank in the creditor's name are declared null, as covers to fraud; with the exception of indorfations of bills of exchange.

9. Certain privileged writings do not require the ordinary folemnities. 1. Holograph deeds (written by the granter himfelf) are effectual without witneffes. The date of no holograph writing, except a bill of exchange, (fee next paragr.) can be proved by the granter's own affertion, in prejudice either of his heir or his creditors, but muft be fupported by other adminicles. 2. Teftaments, if executed where men of fkill in bufinefs cannot be had, are valid though they fhould not be quite formal: and let the fubject of a teftament be ever fo valuable, one notary figning for the teftator, before two witneffes, is in practice fufficient. Clergymen were frequently notaries before the reformation; and, though they were afterwards prohibited to act as notaries, the cafe of teftaments is excepted; fo that thefe are fupported by the atteftation of one minifter, with two witneffes. 3. Difcharges to tenants are fuftained without witneffes, from their prefumed rufticity, or ignorance in bufinefs. 4. Miffive letters *in re mercatoria*, commiffions, and fitted accounts in the courfe of trade, and bills of exchange, though they are not holograph, are, from the favour of commerce, fuftained without the ordinary folemnities.

10. A bill of exchange is an obligation in the form of a mandate, whereby the drawer or mandant defires him to whom it is directed, to pay a certain fum, at the day and place therein mentioned, to a third party. Bills of exchange are drawn by a perfon in one country to his correfpondent in another; and they have that name, becaufe it is the exchange, or the value of money in one place compared with its value in another, that generally determines the precife extent of the fum contained in the draught. The creditor in the bill is fometimes called the the poffeffor, or *porteur*. As parties to bills are of different countries, queftions concerning them ought to be determined by the received cuftom of trading nations, unlefs where fpecial ftatute interpofes. For this reafon, bills of exchange, though their form admits not of witneffes, yet prove their own dates, in queftions either with the heir, or creditors of the debtor; but this doctrine is not extended to inland bills payable to the drawer himfelf.

11. A bill is valid, without the defignation, either of the drawer, or of the perfon to whom it is made payable: It is enough, that the drawer's fubfcription appears to be truly his; and one's being poffeffor of a bill marks him out to be the creditor, if he bears the name given in the bill to the creditor: Nay, though the perfon drawn on fhould not be defigned, his acceptance prefumes that it was he whom the drawer had in his eye. Bills drawn blank, in the creditor's name, fall under the ftatutory nullity; for though indorfations of bills are excepted from it, bills themfelves are not. Not only the perfon drawn upon muft fign his acceptance, but the drawer muft fign his draught, before any obligation can be formed againft the accepter: Yet it is fufficient in practice, that the drawer figns, before the bill be produced in judgment; though it fhould be after the death both of the creditor and accepter. A creditor in a bill may tranfmit it to another by indorfation, though the bill fhould not bear *to his order;* by the fame rule that other rights are tranfmiffible by affignation, though they do not bear *to affigneys.*

12. The drawer, by figning his draught, becomes liable for the value to the creditor in the bill, in cafe the perfon drawn upon either does not accept, or after acceptance does not pay; for he is prefumed to have received value from the creditor at giving him the draught, though it fhould not bear *for value received*: But, if the drawer was debtor to the creditor in the bill before the draught, the bill is prefumed to be given towards payment of the debt, unlefs it exprefsly bears *for value.* The perfon drawn upon, if he refufe to accept, while he has the drawer's money in his hands, is liable to him in damages. As a bill prefumes value from the creditor, indorfation prefumes value from the indorfee; who therefore, if he cannot obtain payment from the accepter, has recourfe againft the indorfer, unlefs the bill be indorfed in thefe words, *without recourfe.*

13. Payment of a bill, by the accepter, acquits both the drawer and him at the hands of the creditor; but it intitles the accepter, if he was not the drawer's debtor, to an action of recourfe againft him; and, if he was, to a

a ground of compenſation. Where the bill does not bear value in the hands of the perſon drawn upon, it is preſumed that he is not the drawer's debtor, and conſequently he has recourſe againſt the drawer, *ex mandato.*

14. Bills, when indorſed, are conſidered as ſo many bags of money delivered to the onerous indorſee; which therefore carry right to the contents, free of all burdens that do not appear on the bills themſelves. Hence, a receipt or diſcharge, by the original creditor, if granted on a ſeparate paper, does not exempt the accepter from ſecond payment to the indorſee; hence alſo, no ground of compenſation competent to the accepter againſt the original creditor can be pleaded againſt the indorſee: But, if the debtor ſhall prove, by the oath of the indorſee, that he paid not the full value for the indorſation, the indorſee is juſtly conſidered as but a name; and therefore all exceptions, receivable againſt the original creditor, will be ſuſtained againſt him.

15. Bills muſt be negotiated by the poſſeſſor, againſt the perſon drawn upon, within a preciſe time, in order to preſerve recourſe againſt the drawer. In bills payable ſo many days after ſight, the creditor has a diſcretionary power of fixing the payment ſomewhat ſooner or later, as his occaſions ſhall require. Bills payable on a day certain, need not be preſented for acceptance till the day of payment, becauſe that day can neither be prolonged nor ſhortened by the time of acceptance. For the ſame reaſon, the acceptance of bills, payable on a preciſe day, need not be dated: But, where a bill is drawn payable ſo many days after ſight, it muſt; becauſe there the term of payment depends on the date of the acceptance.

16 Though bills are, in ſtrict law, due the very day on which they are made payable, and may therefore be proteſted on the day thereafter; yet there are three days immediately following the day of payment, called days of grace, within any of which the creditor may proteſt the bill: But if he delay proteſting till the day after the laſt day of grace, he loſes his recourſe. Where a bill is proteſted, either for not acceptance, or not payment, the diſhonour muſt be notified to the drawer or indorſer, within three poſts at fartheſt. This ſtrictneſs of negotiation is confined to ſuch bills as may be proteſted by the poſſeſſor upon the third day of grace: Where therefore bills are indorſed after the days of grace are expired, the indorſee is left more at liberty, and does not loſe his recourſe, though he ſhould not take a formal proteſt for not payment, if, within a reaſonable time, he ſhall give the indorſer notice of the accepter's refuſing to pay. Not only does the poſſeſſor, who neglects ſtrict negotiation, loſe his recourſe againſt the drawer, where the perſon drawn upon becomes afterwards bankrupt, but though he ſhould continue ſolvent; for he may, in that caſe, recover payment from the debtor, and ſo is not to be indulged in an unneceſſary proceſs againſt the drawer, which he has tacitly renounced by his negligence. Recourſe is preſerved againſt the drawer, though the bill ſhould not be duly negotiated, if the perſon drawn upon was not his debtor; for there the drawer can qualify no prejudice by the neglect of diligence, and he ought not to have drawn on one who owed him nothing.

17. The privileges ſuperadded to bills by ſtatute are, that tho', by their form, they can have no clauſe of regiſtration, yet, if duly proteſted, they are regiſtrable within ſix months after their date in caſe of not acceptance, or in ſix months after the term of payment in the caſe of not payment; which regiſtration is made the foundation of ſummary diligence, either againſt the drawer or indorſer in the caſe of not acceptance, or againſt the accepter in caſe of not payment. This is extended to inland bills, *i. e.* bills both drawn and made payable in Scotland. After acceptance, ſummary diligence lies againſt no other than the accepter; the drawer and indorſer muſt be purſued by an ordinary action. It is only the principal ſum in the bill, and intereſt, that can be charged for ſummarily: The exchange, when it is not included in the draught, the re exchange incurred by ſuffering the bill to be proteſted and returned, and the expence of diligence, muſt all be recovered by an ordinary action; becauſe theſe are not liquid debts, and ſo muſt be previouſly conſtituted.

18. Bills, when drawn payable at any conſiderable diſtance of time after date, are denied the privileges of bills; for bills are intended for currency, and not to lie as a ſecurity in the creditor's hands. Bills are not valid which appear *ex facie* to be donations. No extrinſic ſtipulation ought to be contained in a bill which deviates from the proper nature of bills; hence, a bill to which a penalty is adjected, or with a clauſe of intereſt from the date, is null. Inland precepts drawn, not for money the medium of trade, but for fungibles, are null, as wanting writer's name and witneſſes. It is not an agreed point whether promiſſory notes, without writer and witneſſes, unleſs holograph, are probative. This however is certain, that they at no rate intitle to the privileges of bills.

19. As for the ſolemnities eſſential to deeds ſigned in a foreign country, when they come to receive execution in Scotland, it is a general rule, that no laws can be of authority beyond the dominions of the lawgiver. Hence, in ſtrictneſs, no deed, though perfected according to the law of the place where it is ſigned, can have effect in another country where different ſolemnities are required to a deed of that ſort. But this rigour is ſo ſoftened *ex comitate*, by the common conſent of nations, that all perſonal obligations granted according to the law of that country where they are ſigned, are effectual every where, which obtains even in obligations to convey heritage. Conveyances themſelves, of heritable ſubjects, muſt be perfected according to the law of the country where the heritage lies, and from which it cannot be removed.

20. A writing, while the granter keeps it under his own power or his doer's, has no force; it becomes obligatory, only after it is delivered to the grantee himſelf, or found in the hands of a third perſon. As to which laſt, the following rules are obſerved. A deed found in the hands of one, who is doer both for the granter and grantee, is preſumed to have been put in his hands as doer for the grantee. The preſumption is alſo for delivery, if the deed appears in the hands of one who is a ſtranger to both. Where a deed is depoſited in the hands of a third perſon, the terms of depoſitation may be proved by the oath of the depoſitary, unleſs where they are reduced

reduced into writing. A deed appearing in the cuftody of the grantee himfelf, is confidered as his abfolute right; in fo much that the granter is not allowed to prove that it was granted in truft, otherwife than by a written declaration figned by the truftee, or by his oath.

21. The following deeds are effectual without delivery, 1. Writings containing a claufe difpenfing with the delivery: Thefe are of the nature of revokable deeds, where the death of the granter is equivalent to delivery, becaufe after death there can be no revocation. 2. Deeds in favour of children, even natural ones; for parents are the proper cuftodiars or keepers of their childrens writings. From a fimilar reafon, poftnuptial fettlements by the hufband to the wife need no delivery. 3. Rights which are not to take effect till the granter's death, or even where he referves an intereft to himfelf during his life; for it is prefumed he holds the cuftody of thefe, merely to fecure to himfelf fuch referved intereft. 4. Deeds that the granter lay under an antecedent natural obligation to execute, *e.g.* rights granted to a cautioner for his relief. 5. Mutual obligations, *e. g.* contracts; for every fuch deed, the moment it is executed, is a common evident to all the parties contracters. Laftly, the publication of a writing by regiftration, is equivalent to delivery.

Tit. 22. *Of Obligations and Contracts arifing from Confent, and of acceffory Obligations.*

Contracts confenfual, *i. e.* which might, by the Roman law, be perfected by fole confent, without the intervention either of things or of writing, are fale, permutation, location, fociety, and mandate. Where the fubject of any of thefe contracts is heritable, writing is neceffary.

2. Sale is a contract, by which one becomes obliged to give fomething to another, in confideration of a certain price in current money to be paid for it. Things confifting merely in hope, may be the fubject of this contract, as the draught of a net. Commodities, where their importation or ufe is abfolutely prohibited, cannot be the fubject of fale; and even in run goods, no action lies againft the vender for not delivery, if the buyer knew the goods were run.

3. Though this contract may be perfected before delivery of the fubject, the property remains till then with the vender. See Tit. viii. 9. Yet till delivery, the hazard of its deterioration falls on the purchafer, becaufe he has all the profits arifing from it, after the fale. On the other hand, the fubject itfelf perifhes to the vender; 1. If it fhould perifh through his fault, or after his undue delay to deliver it. 2. If a fubject is fold as a fungible, and not as an individual, or *corpus*, *e g.* a quantity of farm-wheat, fold without diftinguifhing the parcel to be delivered from the reft of the farm. 3. The *periculum* lies on the vender till delivery, if he be obliged by a fpecial article in the contract to deliver the fubject at a certain place.

4. Location is that contract, where an hire is ftipulated for the ufe of things, or for the fervice of perfons. He who lets his work or the ufe of his property to hire, is the locator or leffor; and the other, the conductor or leffee. In the location of things, the leffor is obliged to deliver the fubject, fitted to the ufe it was let for; and the leffee muft preferve it carefully, put it to no other ufe, and, after that is over, reftore it. Where a workman or artificer lets his labour, and if the work is either not performed according to contract, or if it be infufficient, even from mere unfkilfulnefs, he is liable to his employer in damages, for he ought not, as an artificer, to have undertaken a work to which he was not equal. A fervant hired for a certain term, is intitled to his full wages, though from ficknefs or other accident he fhould be difabled for a part of his time; but, if he die before the term, his wages are only due for the time he actually ferved. If a mafter dies, or without good reafon turns off, before the term, a fervant who eats in his houfe, the fervant is intitled to his full wages, and to his maintenance till that term: And, on the other part, a fervant who without ground deferts his fervice, forfeits his wages and maintenance, and is liable to his mafter in damages.

5. Society or copartnerfhip is a contract, whereby the feveral partners agree concerning the communication of lofs and gain arifing from the fubject of the contract. It is formed by the reciprocal choice that the partners make of one another; and fo is not conftituted in the cafe of co-heirs, or of feveral legatees in the fame fubject. A copartnerfhip may be fo conftituted, that one of the partners fhall, either from his fole right of property in the fubject, or from his fuperior fkill, be intitled to a certain fhare of the profits, without being fubjected to any part of the lofs; but a fociety, where one partner is to bear a certain proportion of lofs, without being intitled to any fhare of the profits, is juftly reprobated. All the partners are intitled to fhares of profit and lofs proportioned to their feveral ftocks, where it is not otherwife covenanted.

6. As partners are united, from a *delectus perfonæ*, in a kind of brotherhood, no partner can, without a fpecial power contained in the contract, transfer any part of his fhare to another. All the partners are bound *in folidum* by the obligation of any one of them, if he fubfcribe by the *firm* or focial name of the company; unlefs it be a deed that falls not under the common courfe of adminiftration. The company-effects are the company property of the fociety fubjected to its debts; fo that no partner can claim a divifion thereof, even after the fociety is diffolved, till thefe are paid: And, confequently, no creditor of a partner can, by diligence, carry to himfelf the property of any part of the common ftock, in prejudice of a company-creditor: but he may, by arreftment, fecure his debtor's fhare in the company's hands, to be made forthcoming to him at the clofe of the copartnerfhip, in fo far as it is not exhaufted by the company debts.

7. Society being founded in the mutual confidence among the *focii*, is diffolved, not only by the renunciation, but by the death of any one of them, if it be not otherwife fpecially covenanted. A partner, who renounces upon unfair views, or at a critical time, when his withdrawing may be fatal to the fociety, loofes his partners from all their engagements to him, while he is bound to them for all the profits he fhall make by his withdraw-

ing,

ing, and for the loſs ariſing thereby to the company. Not only natural, but civil death, *e. g.* ariſing from a ſentence inflicting capital puniſhment, makes one incapable to perform the duties of a partner, and conſequently diſſolves the ſociety. In both caſes, of death and renunciation, the remaining partners may continue the copartnerſhip, either expreſsly, by entering into a new contract; or tacitly, by carrying on their trade as formerly. Public trading companies are now every day conſtituted, with rules very different from thoſe which either obtained in the Roman law, or at this day obtain in private ſocieties. The proprietors or partners in theſe, though they may transfer their ſhares, cannot renounce; nor does their death diſſolve the company, but the ſhare of the deceaſed deſcends to his repreſentative.

8 A joint trade is not a copartnerſhip, but a momentary contract, where two or more perſons agree to contribute a ſum, to be employed in a particular courſe of trade, the produce whereof is to be divided among the adventurers, according to their ſeveral ſhares, after the voyage is finiſhed. If, in a joint trade, that partner who is intruſted with the money for purchaſing the goods, ſhould, in place of paying them in caſh, buy them upon credit, the furniſher who followed his faith alone in the ſale, has no recourſe againſt the other adventurers; he can only recover from them what of the buyer's ſhare is yet in their hands. Where any one of the adventurers, in a joint trade, becomes bankrupt, the others are preferable to his creditors, upon the common ſtock, as long as it continues undivided, for their relief of all the engagements entered into by them on account of the adventure.

9. Mandate is a contract, by which one employs another to manage any buſineſs for him; and by the Roman law, it muſt have been gratuitous. It may be conſtituted tacitly, by one's ſuffering another to act in a certain branch of his affairs, for a tract of time together, without challenge. The mandatory is at liberty not to accept of the mandate; and, as his powers are ſolely founded in the mandant's commiſſion, he muſt, if he undertakes it, ſtrictly adhere to the directions given him: Nor is it a good defence, that the method he followed was more rational; for in that his employer was the proper judge. Where no ſpecial rules are preſcribed, the mandatory, if he acts prudently, is ſecure, whatever the ſucceſs may be; and he can ſue for the recovery of all the expences reaſonably diſburſed by him in the execution of his office.

10. Mandates may be general, containing a power of adminiſtring the mandant's whole affairs; but no mandate implies a power of diſpoſing gratuitouſly of the conſtituent's property; nor even of ſelling his heritage for an adequate price: But a general mandatory may ſell ſuch of the moveables as muſt otherwiſe periſh. No mandatory can, without ſpecial powers, tranſact doubtful claims belonging to his conſtituent, or refer them to arbiters.

11. Mandates expire, 1. By the revocation of the employer, though only tacit, as if he ſhould name another mandatory for the ſame buſineſs. 2. By the renunciation of the mandatory; even after he has executed part of his commiſſion, if his office be gratuitous. 3. By the death, either of the mandant or mandatory: But if matters are not entire, the mandate continues in force, notwithſtanding ſuch revocation, renunciation, or death. Procuratories of reſignation, and precepts of ſeiſin, are made out in the form of mandates; but, becauſe they are granted for the ſole benefit of the mandatory, all of them, excepting precepts of *clare conſtat*, are declared to continue after the death either of the granter or grantee. Deeds which contain a clauſe or mandate for regiſtration, are for the ſame reaſon made regiſtrable after the death of either.

12. The favour of commerce has introduced a tacit mandate, by which maſters of ſhips are empowered to contract in name of their exercitors or employers, for repairs, ſhip-proviſions, and whatever elſe may be neceſſary for the ſhip or crew; ſo as to oblige, not themſelves only, but their employers. Whoever has the actual charge of the ſhip is deemed the maſter, though he ſhould have no commiſſion from the exercitors, or ſhould be ſubſtituted by the maſter in the direction of the ſhip without their knowledge. Exercitors are liable, whether the maſter has paid his own money to a merchant for neceſſaries, or has borrowed money to purchaſe them. The furniſher or lender muſt prove that the ſhip needed repairs, proviſions, *&c* to ſuch an extent; but he is under no neceſſity to prove the application of the money or materials to the ſhip's uſe. If there are ſeveral exercitors, they are liable *ſinguli in ſolidum*. In the ſame manner the undertaker of any branch of trade, manufacture, or other land negotiation, is bound by the contracts of the inſtitors whom he ſets over it, in ſo far as relates to the ſubject of the *præpoſitura*.

13. Contracts and obligations, in themſelves imperfect, receive ſtrength, by the contracter or his heirs doing any act thereafter which imports an approbation of them, and conſequently ſupplies the want of an original legal conſent: This is called homologation; and it takes place even in deeds intrinſically null, whether the nullity ariſes from the want of ſtatutory ſolemnities, or from the incapacity of the granter. It cannot be inferred, 1. By the act of a perſon who was not in the knowledge of the original deed; for one cannot approve what he is ignorant of. 2 Homologation has no place where the act or deed which is pleaded as ſuch can be aſcribed to any other cauſe; for an intention to come under an obligation is not preſumed.

14. Quaſi-contracts are formed without explicit conſent, by one of the parties doing ſomething that by its nature either obliges him to the other party or the other party to him. Under this claſs may be reckoned tutory, *&c.* the entry of an heir, *negotiorum geſtio*, *indebiti ſolutio*, communion of goods between two or more common proprietors, and *mercium jactus levandæ navis cauſa*. *Negotiorum geſtio* forms thoſe obligations which ariſe from the management of a perſon's affairs in his abſence, by another, without a mandate. As ſuch manager acts without authority from the proprietor, he ought to be liable in exact diligence, unleſs he has from friendſhip interpoſed in affairs which admitted no delay; and he is accountable for his intromiſſions with intereſt. On the

other

other part, he is intitled to the recovery of his neceſſary diſburſements on the ſubject, and to be relieved of the obligations in which he may have bound himſelf in conſequence of the management.

15. *Indebiti ſolutio*, or the payment to one of what is not due to him, if made through any miſtake, either of fact, or even of law, founds him who made the payment in an action againſt the receiver for repayment (*condictio indebiti.*) This action does not lie, 1. If the ſum paid was due *ex æquitate*, or by a natural obligation; for the obligation to reſtore is founded ſolely in equity. 2. If he who made the payment knew that nothing was due; for *qui conſulto dat quod non debebat, præſumitur donare.*

16. Where two or more perſons become common proprietors of the ſame ſubject, either by legacy, gift or purchaſe, without the view of co partnerſhip, an obligation is thereby created among the proprietors to communicate the profit and loſs ariſing from the ſubject, while it remains common: And the ſubject may be divided at the ſuit of any having intereſt. This diviſion, where the queſtion is among the common proprietors, is *according to the valuation of their reſpective properties:* But, where the queſtion is between the proprietors and thoſe having ſervitudes upon the property, the ſuperfice is only divided, without prejudice to the property. Commonties belonging to the King, or to royal boroughs, are not diviſible. Lands lying runrig, and belonging to different proprietors, may be divided, with the exception of borough and incorporated acres; the execution of which is committed to the judge-ordinary, or juſtices of the peace.

17. The throwing of goods overboard, for lightening a ſhip in a ſtorm, creates an obligation, whereby the owners of the ſhip and goods ſaved are obliged to contribute for the relief of thoſe whoſe goods were thrown overboard, that ſo all may bear a proportional loſs of the goods ejected for the common ſafety. In this contribution, the ſhip's proviſions ſuffer no eſtimation. A maſter who has cut his maſt, or parted with his anchor, to ſave the ſhip, is intitled to this relief; but if he has loſt them by the ſtorm, the loſs falls only on the ſhip and freight. If the ejection does not ſave the ſhip, the goods preſerved from ſhipwreck are not liable in contribution. Ejection may be lawfully made, if the maſter and a third part of the mariners judge that meaſure neceſſary, though the owner of the goods ſhould oppoſe it: And the goods ejected are to be valued at the price that the goods of the ſame ſort which are ſaved ſhall be afterwards ſold for.

18. There are certain obligations, which cannot ſubſiſt by themſelves, but are acceſſions to, or make a part of other obligations. Of this ſort are fidejuſſion, and the obligation to pay intereſt. Cautionry, or fidejuſſion, is that obligation by which one becomes engaged as ſecurity for another, that he ſhall either pay a ſum, or perform a deed.

19. A cautioner for a ſum of money may be bound, either ſimply as cautioner for the principal debtor, or conjunctly and ſeverally for and with the principal debtor. The firſt has, by our cuſtoms, the *beneficium ordinis*, or of diſcuſſion; by which the creditor is obliged to diſcuſs the proper debtor, before he can inſiſt for payment againſt the cautioner. Where one is bound as full debtor with and for the principal, or conjunctly and ſeverally with him, the two obligants are bound equally in the ſame obligation, each *in ſolidum*; and conſequently, the cautioner, though he is but an acceſſory, may be ſued for the whole, without either diſcuſſing, or even citing the principal debtor. Cautioners for performance of facts by another, or for the faithful diſcharge of an office, *e. g.* for factors, tutors, *&c.* cannot by the nature of their engagement be bound conjunctly and ſeverally with the principal obligant, becauſe the fact to which the principal is bound cannot poſſibly be performed by any other. In ſuch engagements, therefore, the failure muſt be previouſly conſtituted againſt the proper debtor, before action can be brought againſt the cautioner, for making up the loſs of the party ſuffering.

20. The cautioner, who binds himſelf at the deſire of the principal debtor, has an *actio mandati*, or of relief againſt him, for recovering the principal and intereſt paid by himſelf to the creditor, and for neceſſary damages; which action lies *de jure*, though the creditor ſhould not aſſign to him on payment. As relief againſt the debtor is implied in fidejuſſory obligations, the cautioner, where ſuch relief is cut off, is no longer bound: Hence, the defence of preſcription frees the cautioner, as well as the principal debtor.

21. But, 1. Where the cautionry is interpoſed to an obligation merely natural, the relief is reſtricted to the ſums that have really turned to the debtor's profit. 2. A cautioner who pays without citing the debtor, loſes his relief, in ſo far as the debtor had a relevant defence againſt the debt, in whole or in part. Relief is not competent to the cautioner, till he either pays the debt, or is diſtreſſed for it; except, 1. Where the debtor is expreſsly bound to deliver to the cautioner his obligation cancelled, againſt a day certain, and has failed; or, 2. Where the debtor is *vergens ad inopiam*; in which caſe the cautioner may, by proper diligence, ſecure the debtor's funds for his own relief, even before payment or diſtreſs.

22. A right of relief is competent *de jure* to the cautioner who pays againſt his co-cautioners, unleſs where the cautioner appears to have renounced it. In conſequence of this implied relief, a creditor, if he ſhall grant a diſcharge to any one of the cautioners, muſt, in demanding the debt from the others, deduct that part, as to which he has cut off their relief by that diſcharge. Where a cautioner in a bond ſigns a bond of corroboration, as a principal obligant with the proper debtor, and with them a new cautioner, the cautioner in the new bond is intitled to a total relief againſt the firſt cautioner, at whoſe deſire he is preſumed to be bound.

23. Cautionry is alſo judicial, as in a ſuſpenſion. It is ſufficient to looſe the cautioner, that when he became bound, the ſuſpender had good reaſon to ſuſpend, *e. g.* if the charger had at that period no title, or had not then performed his part, though theſe grounds of ſuſpenſion ſhould be afterwards taken off. In all maritime cauſes, where the parties are frequently foreigners, the defender muſt give caution *judicio ſiſti et judicatum ſolvi:* Such cautioner gets free by the death of the defender before ſentence;

fentence; but he continues bound, though the caufe fhould be carried from the admiral to the court of feffion. This fort of caution is only to be exacted in caufes ftrictly maritime.

24. It happens frequently, that a creditor takes two or more obligants bound to him, all as principal debtors, without fidejuffion. Where they are fo bound, for the performance of facts that are in themfelves indivifible, they are liable each for the whole, or *finguli in folidum*. But, if the obligation be for a fum of money, they are only liable *pro rata*; unlefs, 1. Where they are in exprefs words bound conjunctly and feverally; or, 2. In the cafe of bills or promiffory notes One of feveral obligants of this fort, who pays the whole debt, or fulfils the obligation, is intitled to a proportional relief againft the reft; in fuch manner, that the lofs muft, in every cafe, fall equally upon all the folvant obligants.

25. Obligations for fums of money are frequently accompanied with an obligation for the annualrent or intereft thereof. Intereft (*ufuræ*) is the profit due, by the debtor of a fum of money, to the creditor, for the ufe of it. The canon law confidered the taking of intereft as unlawful: The law of Mofes allowed it to be exacted from ftrangers; and all the reformed nations of Europe have found it neceffary, after the example of the Romans, to authorife it at certain rates fixed by ftatute. Soon after the reformation, our legal intereft was fixed at the rate of ten *per cent. per annum*; from which time, it has been gradually reduced, till at laft, by 12. *Ann. ftat.* 2. *c.* 16. it was brought to five *per cent.* and has continued at that rate ever fince.

26 Intereft is due, either by law, or by paction. It is due by law, either from the force of ftatute, under which may be included acts of federunt, or from the nature of the tranfaction. Bills of exchange, and inland bills, though they fhould not be protefted, carry intereft from their date in cafe of not acceptance; or from the day of their falling due, in cafe of acceptance and not payment. Where a bill is accepted, which bears no term of payment, or which is payable on demand, no intereft is due till demand be made of the fum, the legal voucher of which is a notorial proteft. Intereft is due by a debtor after denunciation, for all the fums contained in the diligence, even for that part which is made up of intereft. Sums paid by cautioners on diftrefs, carry intereft, not only as to the principal fum in the obligation, but as to to the intereft paid by the cautioner. Factors named by the court of Seffion are liable for intereft by a fpecial act of federunt; fee Tit. xix. 10.

27. It arifes *ex lege*, or from the nature of the tranfaction, that a purchafer in a fale is liable in intereft for the price of the lands bought from the term of his entry, though the price fhould be arrefted in his hands, or tho' the feller fhould not be able to deliver to him a fufficient progrefs or title to the lands; for no purchafer can in equity enjoy the fruits of the lands, while at the fame time he retains the intereft of the price: But lawful confignation of the price made by a purchafer, upon the refufal of the perfons having right to receive it, ftops the currency of intereft. Where one intermeddles with money belonging to another which carries intereft, he ought to reftore it *cum omni obventione et caufa*, and is therefore liable in the intereft of it, as being truly an acceffory of the fubject itfelf. It is alfo from the nature of the tranfaction, that intereft is in certain cafes allowed to merchants or others in name of damages.

28. Intereft is due by exprefs paction, where there is a claufe in a bond or obligation, by which money is made to carry intereft. An obligation is not lawful, where it is agreed on, that the yearly intereft of the fum lent, if it fhould not be paid punctually as it falls due, fhall be accumulated into a principal fum bearing intereft; but an obligation may be lawfully granted, not only for the fum truly lent, but for the intereft to the day at which the obligation is made payable, whereby the intermediate intereft is accumulated into a principal fum, from the term of payment. Intereft may be alfo due by implied paction: Thus, where intereft upon a debt is by a letter promifed for time paft, fuch promife implies a paction for intereft as long as the debt remains unpaid; thus alfo, the ufe of payment of intereft prefumes a paction, and when intereft is expreffed for one term, it is prefumed to be bargained for till payment.

29. The fubject matter of all obligations confifts either of things, or of facts. Things exempted from commerce cannot be the fubject of obligation. See Tit. viii. 2. et feq. One cannot be obliged to the performance of a fact naturally impoffible; nor of a fact in itfelf immoral, for that is alfo in the judgment of law impoffible. Since impoffible obligations are null, no penalty or damage can be incurred for non-performance; but it is otherwife, if the fact be in itfelf poffible, though not in the debtor's power; in which cafe the rule obtains, *locum facti impræftabilis fubit damnum et intereffe*.

30. An obligation, to which a condition is adjected, either naturally or morally impoffible, is in the general cafe null; for the parties are prefumed not to have been ferious. But fuch obligation is valid, and the condition thereof held *pro non fcripta*, 1. In teftaments; 2. In obligations, to the performance of which the granter lies under a natural tie, as in bonds of provifion to a child. Where an obligation is granted under a condition, lawful but unfavourable, *e. g.* that the creditor fhall not marry without the confent of certain friends, no more weight is given to the condition than the judge thinks reafonable, A condition, which is in fome degree in the power of the creditor himfelf, is held as fulfilled, if he has done all he could to fulfil it. Implement or performance cannot be demanded in a mutual contract, by that party who himfelf declines, or cannot fulfil the counterpart.

31. Donation, fo long as the fubject is not delivered to the donee, may be juftly ranked among obligations; and it is that obligation which arifes from the mere good will and liberality of the granter. Donations imply no warrandice, but from the future facts of the donor. They are hardly revokable by our law for ingratitude, though it fhould be of the groffeft kind: Thofe betwixt man and wife are revokable by the donor, even after the death of the donee; but remuneratory grants, not being truly donations, cannot be fo revoked That fpecial fort of donation, which is conftituted verbally, is called a promife. The Roman law intitled all donors to the *beneficium*

neficium competentiæ, in virtue of which they might retain ſuch part of the donation as was neceſſary for their own ſubſiſtence. Our law allows this benefit to fathers, with reſpect to the proviſions granted to their children, and to grandfathers, which is a natural conſequence of childrens obligation to aliment their indigent parents; but to no collateral relation, not even to brothers.

32. Donations, made in contemplation of death, or *mortis cauſa*, are of the nature of legacies, and like them revokable: Conſequently, not being effectual in the granter's life, they cannot compete with any of his creditors; not even with thoſe whoſe debts were contracted after the donation. They are underſtood to be given from a perſonal regard to the donee, and therefore fall by his predeceaſe. No deed, after delivery, is to be preſumed a *donatio mortis cauſa*; for revocation is excluded by delivery.

33. Deeds are not preſumed, *in dubio*, to be donations. Hence, a deed by a debtor to his creditor, if donation be not expreſſed, is preſumed to be granted in ſecurity or ſatisfaction of the debt; but bonds of proviſion to children are, from the preſumption of paternal affection, conſtrued to be intended as an additional patrimony: Yet a tocher, given to a daughter in her marriage-contract, is preſumed to be in ſatisfaction of all former bonds and debts; becauſe marriage-contracts uſually contain the whole proviſions in favour of the bride. One who aliments a perſon that is come of age, without an expreſs paction for board, is preſumed to have entertained him as a friend, unleſs in the caſe of thoſe who earn their living by the entertainment or board of ſtrangers. But alimony given to minors, who cannot bargain for themſelves, is not accounted a donation; except either where it is preſumed, from the near relation of the perſon alimenting, that it was given *ex pietate*; or where the minor had a father or curators, with whom a bargain might have been made.

Tit. 23. *Of the Diſſolution or Extinction of Obligations.*

Obligations may be diſſolved by performance or implement, conſent, cômpenſation, novation, and confuſion. 1. By ſpecifical performance: Thus, an obligation for a ſum of money is extinguiſhed by payment. The creditor is not obliged to accept of payment by parts, unleſs where the ſum is payable by different diviſions. If a debtor in two or more ſeparate bonds to the ſame creditor, made an indefinite payment, without aſcribing it, at the time, to any one of the obligations, the payment is applied, 1. To intereſt, or to ſums not bearing intereſt. 2. To the ſums that are leaſt ſecured, if the debtor thereby incurs no rigorous penalty. But, 3. If this application be penal on the debtor, *e. g.* by ſuffering the legal of an adjudication to expire, the payment will be ſo applied to as to ſave the debtor from that forfeiture. Where one of the debts is ſecured by a cautioner, the other not, the application is to be ſo made, *cæteris paribus*, that both creditor and cautioner may have equal juſtice done to them.

2. Payment made by the debtor upon a miſtake in fact, to one whom he believed, upon probable grounds, to have the right of receiving payment, extinguiſhes the obligation. But payment made to one, to whom the law denies the power of receiving it, has not this effect; as if a debtor, ſeized by letters of caption, ſhould make payment to the meſſenger; for *ignorantia juris neminem excuſat*. In all debts, the debtor, if he be not interpelled, may ſafely pay before the term, except in tack-duties or feu-duties; the payment whereof, before the terms at which they are made payable, is conſtrued to be colluſive, in a queſtion with a creditor of the landlord or ſuperior. Payment is *in dubio* preſumed, by the voucher of the debt being in the hands of the debtor; *chirographum, apud debitorem repertum, præſumitur ſolutum.*

3. Obligations are extinguiſhable by the conſent of the creditor, who, without full implement, or even any implement, may renounce the right conſtituted in his own favour. Though a diſcharge or acquittance, granted by one whom the debtor *bona fide* took for the creditor, but who was not, extinguiſhes the obligation, if the ſatisfaction made by the debtor was real; yet where it is imaginary, the diſcharge will not ſcreen him from paying to the true creditor the debt that he had made no prior ſatisfaction for. In all debts which are conſtituted by writing, the extinction, whether it be by ſpecifical performance, or bare conſent, muſt be proved, either by the oath of the creditor, or by a diſcharge in writing; and the ſame ſolemnities which law requires in the obligation, are neceſſary in the diſcharge: But, where payment is made, not by the debtor himſelf, but by the creditor's intromiſſion with the rents of the debtor's eſtate, or by delivery to him of goods in name of the debtor, ſuch delivery or intromiſſion, being *facti*, may be proved by witneſſes, though the debt ſhould have been not only conſtituted by writing, but made real on the debtor's lands by adjudication.

4. A diſcharge, though it ſhould be general, of all that the granter can demand, extends not to debts of an uncommon kind, which are not preſumed to have been under the granter's eye. This doctrine applies alſo to general aſſignations. In annual payments, as of rents, feu-duties, intereſt, *&c.* three conſecutive diſcharges by the creditor, of the yearly or termly duties, preſume the payment of all preceedings. Two diſcharges by the anceſtor, and the third by the heir, do not infer this preſumption, if the heir was ignorant of the anceſtor's diſcharges. And diſcharges by an adminiſtrator, as a factor, tutor, *&c.* preſume only the payment of all preceeding duties incurred during his adminiſtration. This preſumption ariſes from repeating the diſcharges thrice ſucceſſively; and ſo does not hold in the caſe of two diſcharges, though they ſhould include the duties of three or more terms.

5. Where the ſame perſon is both creditor and debtor to another, the mutual obligations, if they are for equal ſums, are extinguiſhed by compenſation; if for unequal, ſtill the leſſer obligation is extinguiſhed, and the greater diminiſhed, as far as the concourſe of debt and credit goes. To found compenſation, 1. Each of the parties muſt be debtor and creditor at the ſame time. 2. Each

of

of them muſt be debtor and creditor in his own right. 3. The mutual debts muſt be of the ſame quality: Hence, a ſum of money cannot be compenſated with a quantity of corns; becauſe, till the prices are fixed, at which the corns are to be converted into money, the two debts are incommenſurable. Laſtly, compenſation cannot be admitted, where the mutual debts are not clearly aſcertained, either by a written obligation, the ſentence of a judge, or the oath of the party. Where this requires but a ſhort diſcuſſion, ſentence for the purſuer is delayed for ſome time, *ex æquitate*, that the defender may make good his ground of compenſation. Where a debt for fungibles is aſcertained in money, by the ſentence of a judge, the compenſation can have no effect farther back than the liquidation, becauſe, before ſentence, the debts were incommenſurable: But, where a debt for a ſum of money is, in the courſe of a ſuit, conſtituted by the oath of the debtor, the compenſation, after it is admitted by the judge, operates, *retro*, in ſo far as concerns the currency of intereſt, to the time that, by the parties acknowledgment, the debt became due; for, in this caſe, the debtor's oath is not what creates the debt, or makes it liquid; it only declares that ſuch a liquid ſum was truly due before. Compenſation cannot be offered after decree, either by way of ſuſpenſion or reduction; unleſs it has been formerly pleaded, and unjuſtly repelled. Decrees in abſence are excepted.

6. The right of retention, which bears a near reſemblance to compenſation, is chiefly competent, where the mutual debts, not being liquid, cannot be the ground of compenſation; and it is ſometimes admitted *ex æquitate*, in liquid debts, where compenſation is excluded by ſtatute: Thus, though compenſation cannot be pleaded after decree, either againſt a creditor or his aſſigney; yet, if the original creditor ſhould become bankrupt, the debtor, even after decree, may retain againſt the aſſigney, till he gives ſecurity for ſatisfying the debtor's claim againſt the cedent. This right is frequently founded in the expence diſburſed or work employed on the ſubject retained, and ſo ariſes from the mutual obligations incumbent on the parties. But retention may be ſuſtained, though the debt due to him who claims it does not ariſe from the nature of the obligation by which he is debtor: Thus, a factor on a land eſtate may retain the ſums levied by him in conſequence of his factory, not only till he be paid of the diſburſements made on occaſion of ſuch eſtate, but alſo till he be diſcharged from the ſeparate engagements he may have entered into on his conſtituent's account.

7. Obligations are diſſolved by novation, whereby one obligation is changed into another, without changing either the debtor or creditor. The firſt obligation being thereby extinguiſhed, the cautioners in it are looſed, and all its conſequences diſcharged; ſo that the debtor remains bound only by the laſt. As a creditor to whom a right is once conſtituted, ought not to loſe it by implication, novation is not eaſily preſumed, and the new obligation is conſtrued to be merely corroborative of the old; but, where the ſecond obligation expreſsly bears to be *in ſatisfaction* of the firſt, theſe words muſt neceſſarily be explained into novation. Where the creditor accepts of a new debtor, in place of the former who is diſcharged, this method of extinction is called delegation.

8. Obligations are extinguiſhed *confuſione*, where the debt and credit meet in the ſame perſon, either by ſucceſſion or ſingular title, *e. g.* when the debtor ſucceeds to the creditor, or the creditor to the debtor, or a ſtranger to both, for one cannot be debtor to himſelf. If the ſucceſſion, from which the *confuſio* ariſes, happens afterwards to be divided, ſo as the debtor and creditor come again to be different perſons; the *confuſio* does not produce an extinction, but only a temporary ſuſpenſion of the debt.

Tit. 24. *Of Aſſignations.*

Heritable rights, when they are cloathed with infeftment, are tranſmitted by diſpoſition, which is a writing containing procuratory of reſignation and precept of ſeiſin; but thoſe which either require no ſeiſin, or on which ſeiſin has actually followed, are tranſmiſſible by ſimple aſſignation. He who grants the aſſignation, is called the cedent; and he who receives it, the aſſigney or ceſſionary: If the aſſigney conveys his right to a third perſon, it is called a tranſlation; and if he aſſigns it back to the cedent, a retroceſſion. Certain rights are, from the uſes to which they are deſtined, incapable of tranſmiſſion, as alimentary rights: Others cannot be aſſigned by the perſon inveſted in them, without ſpecial powers given to him, as tacks, reverſions: The tranſmiſſion of a third ſort, is not preſumed to be intended, without an expreſs conveyance; as of paraphernal goods, which are ſo proper to the wife, that a general aſſignation by her to her huſband, of all that did or ſhould belong to her at her deceaſe, does not comprehend them. A liferent-right is, by its nature, incapable of a proper tranſmiſſion; but its profits may be aſſigned, while it ſubſiſts.

2. Aſſignations muſt not only be delivered to the aſſigney, but intimated by him to the debtor. Intimations are conſidered as ſo neceſſary for compleating the conveyance, that in a competition between two aſſignations, the laſt, if firſt intimated, is preferred.

3. Though, regularly, intimation to the debtor is made by an inſtrument, taken in the hands of a notary, by the aſſigney or his procurator; yet the law admits equipollencies, where the notice of the aſſignment given to the debtor is equally ſtrong. Thus, a charge upon letters of horning at the aſſigney's inſtance, or a ſuit brought by him againſt the debtor, ſupplies the want of intimation; theſe being judicial acts, which expoſe the conveyance to the eyes both of the judge and of the debtor; or the debtor's promiſe of payment by writing to the aſſigney, becauſe that is in effect a corroborating of the original debt. The aſſigney's poſſeſſion of the right, by entering into payment of the rents or intereſt, is alſo equal to an intimation; for it imports, not only notice to the debtor, but his actual compliance: But the debtor's private knowledge of the aſſignment is not ſuſtained as intimation.

4. Certain conveyances need no intimation. 1. Indorſations of bills of exchange; for theſe are not to be fettered with forms, introduced by the laws of particular ſtates. 2. Bank-notes are fully conveyed by the bare delivery

delivery of them; for as they are payable to the bearer, their property muſt paſs with their poſſeſſion. 3. Adjudication, which is a judicial conveyance, and marriage, which is a legal one, carry the full right of the ſubjects thereby conveyed, without intimation: neverthelefs, as there is nothing in theſe conveyances which can of themſelves put the debtor *in mala fide*, he is therefore *in tuto* to pay to the wife, or to the original creditor in the debt adjudged, till the marriage or adjudication be notified to him. Aſſignments of moveable ſubjects, though they be intimated, if they are made *retenta poſſeſſione*, (the cedent retaining the poſſeſſion), cannot hurt the cedent's creditors; for ſuch rights are preſumed, in all queſtions with creditors, to be colluſive, and granted in truſt for the cedent himſelf.

5. An aſſignation carries to the aſſigney the whole right of the ſubject conveyed, as it was in the cedent; and conſequently, he may uſe diligence, either in his cedent's name while he is alive, or in his own.

6. After an aſſignation is intimated, the debtor cannot prove payment, or compenſation, by the oath of the cedent, who has no longer any intereſt in the debt; unleſs the matter has been made litigious by an action commenced prior to the intimation: But the debtor may refer to the oath of the aſſigney, who is in the right of the debt, that the aſſignment was gratuitous, or in truſt for the cedent; either of which being proved, the oath of the cedent will affect the aſſigney. If the aſſignation be in part onerous, and in part gratuitous, the cedent's oath is good againſt the aſſigney, only in ſo far as his right is gratuitous. All defences competent againſt the original creditor in a moveable debt, which can be proved otherwiſe than by his oath, continue relevant againſt even an onerous aſſigney; whoſe right can be no better than that of his author, and muſt therefore remain affected with all the burdens which attended it in the author's perſon.

Tit. 25. *Of Arreſtments and Poindings.*

The diligences, whereby a creditor may affect his debtor's moveable ſubjects, are arreſtment and poinding. By arreſtment is ſometimes meant the ſecuring of a criminal's perſon till trial; but as it is underſtood in the rubric of this title, it is the order of a judge, by which he who is debtor in a moveable obligation to the arreſter's debtor, is prohibited to make payment or delivery till the debt due to the arreſter be paid or ſecured. The arreſter's debtor is uſually called the common debtor; becauſe, where there are two or more competing creditors, he is debtor to all of them. The perſon in whoſe hands the diligence is uſed, is ſtyled the arreſtee.

2. Arreſtment may be laid on by the authority either of the ſupreme court, or of an inferior judge. In the firſt caſe, it proceeds either upon ſpecial letters of arreſtment, or on a warrant contained in letters of horning; and it muſt be executed by a meſſenger. The warrants granted by inferior judges are called precepts of arreſtment, and they are executed by the officer proper to the court. Where the debtor to the common debtor is a pupil, arreſtment is properly uſed in the hands of the tutor, as the pupil's adminiſtrator: This doctrine may perhaps extend to other general adminiſtrators, as commiſſioner, *&c.* But arreſtment, uſed in the hands of a factor or ſteward, cannot found an action of forthcoming without calling the conſtituent. Where the debtor to the common debtor is a corporation, arreſtment muſt be uſed in the hands of the directors or treaſurer, who repreſent the whole body. Arreſtment, when it is uſed in the hands of the debtor himſelf, is inept; for that diligence is intended only as a reſtraint upon third parties.

3. All debts, in which one is perſonally bound, though they ſhould be heritably ſecured, are grounds upon which the creditor may arreſt the moveable eſtate belonging to his debtor. Arreſtment may proceed on a debt the term of payment whereof is not yet come, in caſe the debtor be *vergens ad inopiam.* If a debt be not yet conſtituted by decree or regiſtration, the creditor may raiſe and execute a ſummons againſt his debtor for payment, on which pending action arreſtment may be uſed, in the ſame manner as inhibition, which is called arreſtment upon a dependence. If one's ground of credit be for the performance of a fact, or if his depending proceſs be merely declaratory, without a concluſion of payment or delivery, ſuch claims are not admitted to be ſufficient grounds for arreſtment.

4. Moveable debts are the proper ſubject of arreſtment; under which are comprehended conditional debts, and even depending claims. For leſſening the expence of diligence to creditors, all bonds which have not been made properly heritable by ſeiſin are declared arreſtable. But this does not extend to adjudications, wadſets, or other perſonal rights of lands, which are not properly debts. Certain moveable debts are not arreſtable. 1. Debts due by bill, which paſs from hand to hand as bags of money. 2. Future debts; for though inhibition extends to *adquirenda* as well as *adquiſita*, yet arreſtment is limited, by its warrant, to the debt due at the time of ſerving it againſt the arreſtee. Hence, an arreſtment of rents or intereſt carries only thoſe that have already either fallen due, or at leaſt become current. Claims, depending on the iſſue of a ſuit, are not conſidered as future debts; for the ſentence, when pronounced, has a retroſpect to the period at which the claim was firſt founded. The like doctrine holds in conditional debts. 3. Alimentary debts are not arreſtable; for theſe are granted on perſonal conſiderations, and ſo are not communicable to creditors; but the paſt intereſt due upon ſuch debt may be arreſted by the perſon who has furniſhed the alimony. One cannot ſecure his own effects to himſelf for his maintenance, ſo as they ſhall not be affectable by his creditors. Salaries annexed to offices granted by the king, and particularly thoſe granted to the judges of the Seſſion, and the fees of ſervants, are conſidered as alimentary funds; but the ſurplus fee, over and above what is neceſſary for the ſervant's perſonal uſes, may be arreſted.

5. If, in contempt of the arreſtment, the arreſtee ſhall make payment of the ſum, or deliver the goods arreſted, to the common debtor, he is not only liable criminally for breach of arreſtment, but he muſt pay the debt again to the arreſter. Arreſtment is not merely prohibitoty, as inhibitions are; but is a ſtep of diligence which founds the uſer in a ſubſequent action, whereby the property of the

the fubject arrefted may be adjudged to him: It therefore does not, by our later practice, fall by the death of the arreftee, but continues to fubfift, as a foundation for an action of forthcoming againft his heir, while the fubject arrefted remains *in medio*. Far lefs is arreftment loft, either by the death of the arrefter, or of the common debtor.

6. Where arreftment proceeds on a depending action, it may be loofed by the common debtor's giving fecurity to the arrefter for his debt, in the event it fhall be found due. Arreftment founded on decrees, or on regiftred obligations, which in the judgment of law are decrees, cannot be loofed, but upon payment or confignation; except, 1. Where the term of payment of the debt is not yet come, or the condition has not yet exifted. 2. Where the arreftment has proceeded on a regiftred contract, in which the debts or mutual obligations are not liquid. 3. Where the decree is fufpended, or turned into a libel; for, till the fufpenfion be difcuffed, or the pending action concluded, it cannot be known whether any debt be truly due. A loofing takes off the *nexus*, which had been laid on the fubject arrefted; fo that the arreftee may thereafter pay fafely to his creditor, and the cautioner is fubftituted in place of the arreftment, for the arrefter's fecurity: Yet the arrefter may, while the fubject continues with the arreftee, purfue him in a forthcoming, notwithftanding the loofing.

7. Arreftment is only an inchoated or begun diligence; to perfect it, there muft be an action brought by the arrefter againft the arreftee, to make the debt or fubject arrefted forthcoming. In this action, the common debtor muft be called for his intereft, that he may have an opportunity of excepting to the lawfulnefs or extent of the debt, on which the diligence proceeded. Before a forthcoming can be purfued, the debt due by the common debtor to the arrefter, muft be liquidated; for the arrefter can be no further intitled to the fubject arrefted than to the extent of the debt due to him by the common debtor. Where the fubject arrefted is a fum of money, it is, by the decree of forthcoming, directed to be paid to the purfuer towards fatisfying his debt; where goods are arrefted, the judge ordains them to be expofed fale, and the price to be delivered to the purfuer. So that in either cafe, decrees of forthcoming are judicial affignations to the arrefter of the fubject arrefted

8. In all competitions, regard is had to the dates, not of the grounds of debt, but of the diligences proceeding upon them. In the competition of arreftments, the preference is governed by their dates, according to the priority even of hours, where it appears with any certainty which is the firft. But, as arreftment is but a begun diligence, therefore if a prior arrefter fhall neglect to infift in an action of forthcoming for fuch a time as may be reafonably conftrued into a defertion of his begun diligence, he lofes his preference. But, as dereliction of diligence is not eafily prefumed, the diftance of above two years, between the firft arreftment and the decree of forthcoming, was found not to make fuch a *mora* as to intitle the pofterior arrefter to a preference. This rule of preference, according to the dates of the feveral arreftments, holds, by our prefent practice, whether they have proceeded on a decree, or on a dependence; on debts not yet payable, or on debts already payable; provided the pendency fhall have been clofed, or the debt have become payable, before the iffue of the competition.

9. In the competition of arreftments with affignations, an affignation by the common debtor, intimated before arreftment, is preferable to the arreftment. If the affignation is granted before arreftment, but not intimated till after it, the arrefter is preferred

10. Poinding is that diligence affecting moveable fubjects, by which their property is carried directly to the creditor. No poinding can proceed, till a charge be given to the debtor to pay or perform, and the days thereof be expired, except poindings againft vaffals for their feu duties, and poindings againft tenants for rent, proceeding upon the landlord's own decree; in which the ancient cuftom of poinding without a previous charge continues. A debtor's goods may be poinded by one creditor, though they have been arrefted before by another; for arreftment being but an imperfect diligence, leaves the right of the fubject ftill in the debtor, and fo cannot hinder any creditor from ufing a more perfect diligence, which has the effect of carrying the property directly to himfelf.

11. No cattle pertaining to the plough, nor inftruments of tillage, can be poinded in the time of labouring or tilling the ground, unlefs where the debtor has no other goods. By labouring time is underftood, that time, in which that tenant, whofe goods are to be poinded, is ploughing, though he fhould have been earlier or later than his neighbours; but fummer-fallowing does not fall under this rule.

12. In the execution of poinding, the debtor's goods muft be apprifed, firft on the ground of the lands where they are laid hold on, and a fecond time at the market-crofs of the jurifdiction, by the ftated apprifers thereof; or, if there are none, by perfons named by the meffenger or other officer employed in the diligence. Next, the meffenger muft, after public intimation by three oyeffes, declare the value of the goods according to the fecond apprifement, and require the debtor to make payment of the debt, including intereft and expences. If payment fhall be offered to the creditor, or in his abfence to his lawful attorney; or if, in cafe of refufal by them, confignation of the debt fhall be made in the hands of the judge-ordinary or his clerk, the goods muft be left with the debtor; if not, the meffenger ought to adjudge and deliver them over, at the apprifed value, to the ufer of the diligence towards his payment: And the debtor is intitled to a copy of the warrant and executions, as a voucher that the debt is difcharged in whole or in part by the goods poinded.

13. Minifters may poind for their ftipends, upon one apprifement on the ground of the lands; and landlords were always in ufe to poind fo, for their rents. Apprifement of the goods at the market-crofs of the next royal borough, or even of the next head-borough of ftewartry or regality, though thefe jurifdictions be abolifhed, is declared as fufficient as if they were carried to the head-borough of the fhire. Poinding, whether it be confidered as a fentence, or as the execution of a fentence, muft be proceeded

proceeded in between ſun-riſing and ſun-ſetting; or at leaſt it muſt be finiſhed before the going off of day-light. The powers of the officer employed in the execution of poindings, are not clearly defined by cuſtom, in the caſe of a third party claiming the property of the goods to be poinded. This is certain, that he may take the oath of the claimant, upon the verity of his claim; and if from thence it ſhall appear that the claimant's title is colluſive, he ought to proceed in the diligence; but, if there remains the leaſt doubt, his ſafeſt courſe is to deliver the goods to the claimant, and to expreſs in his execution the reaſons why poinding did not proceed.

14. Any perſon who ſtops a poinding *via facti*, on groundleſs pretences, is liable, both criminally, in the pains of deforcement, (ſee Tit. xxxiii. 15.) and civilly, in the value of the goods which might have been poinded by the creditor.

Tit. 26. *Of Preſcriptions.*

Prescription, which is a method, both of eſtabliſhing and of extinguiſhing property, is either poſitive or negative. Poſitive preſcription is generally defined, as the Roman *uſucapio*, the acquiſition of property (it ſhould rather be, when applied to our law, the ſecuring it againſt all further challenge) by the poſſeſſor's continuing his poſſeſſion for the time which law has declared ſufficient for that purpoſe: Negative, is the loſs or amiſſion of a right, by neglecting to follow it forth, or uſe it, during the whole time limited by law. The doctrine of preſcription, which is, by ſome writers, condemned as contrary to juſtice, has been introduced, that the claims of negligent creditors might not ſubſiſt for ever, that property might be at laſt fixed, and forgeries diſcouraged, which the difficulty of detecting muſt have made exceeding frequent, if no length of time had limited the legal effect of writings.

2. Poſitive preſcription was firſt introduced into our law by 1617, *c.* 12. which enacts, that whoever ſhall have poſſeſſed his lands, annualrents, or other heritages, peaceably in virtue of infeftments, for forty years continually after their dates, ſhall not thereafter be diſquieted in his right by any perſon pretending a better title. Under *heritages* are comprehended every right that is *fundo annexum*, and capable of continual poſſeſſion. Continued poſſeſſion, if proved as far back as the memory of man, preſumes poſſeſſion upwards to the date of the infeftment. The whole courſe of poſſeſſion muſt by the act be founded on ſeiſins, and conſequently no part thereof on the bare right of apparency; but forty years poſſeſſion, without ſeiſin, is ſufficient in the preſcription of ſuch heritable rights as do not require ſeiſin. The poſſeſſion muſt alſo be without any *lawful* interruption, *i. e.* it muſt neither be interrupted *via facti*, nor *via juris*. The preſcription of ſubjects not expreſſed in the infeftment as part and pertinent of another ſubject ſpecially expreſſed, has been explained, Tit. xiii. 6.

3. The act requires, that the poſſeſſor produce, as his title of preſcription, a charter of the lands, preceeding the forty years poſſeſſion, with the ſeiſin following on it: and where there is no charter extant, ſeiſins, one or more ſtanding together for forty years, and proceeding either on retours, or precepts of *clare conſtat*. This has given riſe to a reaſonable diſtinction obſerved in practice, between the preſcription of a ſingular ſucceſſor, and of an heir. Singular ſucceſſors muſt produce for their title of preſcription, not only a ſeiſin, but its warrant, as a charter, diſpoſition, *&c.* either in their own perſon, or in that of their author: But the production by an heir of ſeiſins, one or more, ſtanding together for forty years, and proceeding on retours or precepts of *clare conſtat*, is ſufficient. The heir is not obliged to produce the retours or precepts on which his ſeiſins proceed, nor is the ſingular ſucceſſor obliged to produce the ground of his charter; ſo that if the title of preſcription produced be a fair deed, and a ſufficient title of property, the poſſeſſor is ſecure by the act, which admits no ground of challenge, but falſehood. A ſpecial ſtatute, for eſtabliſhing the poſitive preſcription in moveable rights, was not neceſſary; for, ſince a title in writing is not requiſite for the acquiring of theſe, the negative preſcription, by which all right of action for recovering their property is cut off, effectually ſecures the poſſeſſor.

4. The negative preſcription of obligations, by the lapſe of forty years, was introduced into our law long before the poſitive, by 1469, *c.* 29.—1474, *c.* 55. This preſcription is now amplified by the foreſaid act 1617, which has extended it to all actions competent upon heritable bonds, reverſions, and others whatſoever; unleſs where the reverſions are either incorporated in the body of the wadſet right, or regiſtred in the regiſter of reverſions: And reverſions ſo incorporated, or regiſtred, are not only exempted from the negative preſcription, but they are an effectual bar againſt any perſon from pleading the poſitive.

5. A ſhorter negative preſcription is introduced by ſtatute, in certain rights and debts. Actions of ſpuilzie, ejection, *and others of that nature*, muſt be purſued within three years after the commiſſion of the fact on which the action is founded. As in ſpuilzes and ejections, the purſuer was intitled, *in odium* of violence, to a proof by his own oath *in litem*, and to the violent profits againſt the defender, the ſtatute meant only to limit theſe ſpecial privileges by a three years preſcription, without cutting off the right of action, where the claim is reſtricted to ſimple reſtitution. Under the general words, *and others of that nature*, are comprehended all actions where the purſuer is admitted to prove his libel by his own oath *in litem*.

6. Servants fees, houſe-rents, mens ordinaries, (*i. e.* mony due for board,) and merchants accounts, fall under the triennial preſcription, by 1579, *c.* 83. There is alſo a general clauſe ſubjoined to this ſtatute, of *other the like debts*, which includes alimentary debts, wages due to workmen, and accounts due to writers, agents, or procurators. Theſe debts may by this act, be proved after the three years, either by the writing or oath of the debtor; ſo that they preſcribe only as to the mean of proof by witneſſes; but after the three years, it behoves the creditor to refer to the debtor's oath, not only the conſtitution, but the ſubſiſtence of the debt. In the preſcription of houſe rents, ſervants fees, and alimony, each term's

term's rent, fee, or alimony, runs a ſeparate courſe of preſcription; ſo that in an action for theſe, the claim will be reſtricted to the arrears incurred within the three years immediately before the citation: But, in accounts, preſcription does not begin till the laſt article; for a ſingle article cannot be called an account. Actions of removing muſt alſo be purſued within three years after the warning. Reductions of erroneous retours, preſcribe, if not purſued within twenty years.

7. Miniſters ſtipends and multures preſcribe in five years after they are due; and arrears of rent, five years after the tenant's removing from the lands. As the preſcription of mails and duties was introduced in favour of poor tenants, that they might not ſuffer by neglecting to preſerve their diſcharges, a proprietor of lands ſubject to a liferent, who had obtained a leaſe of all the liferented lands from the liferenter, is not intitled to plead it, nor a tackſman of one's whole eſtate, who had by the leaſe a power of removing tenants. Bargains concerning moveables, or ſums of money which are proveable by witneſſes, preſcribe in five years after the bargain. Under theſe are included ſales, locations, and all other conſenſual contracts, to the conſtitution of which writing is not neceſſary. But all the above mentioned debts, may, after the five years, be proved, either by the oath or the writing of the debtor; of which above, § 6. A quinquennial preſcription is eſtabliſhed in arreſtments, whether on decrees or depending actions: The firſt preſcribe in five years after uſing the arreſtment, and the laſt in five years after ſentence is pronounced on the depending action.

8. No perſon binding for or with another, either as cautioner or co-principal, in a bond or contract for a ſum of money, continues bound after ſeven years from the date of the bond, provided he has either a clauſe of relief in the bond, or a ſeparate bond of relief, intimated to the creditor, at his receiving the bond. But all diligence uſed within the ſeven years againſt the cautioner, ſhall ſtand good. As this is a public law, intended to prevent the bad conſequences of raſh engagements, its benefit cannot, before the lapſe of the ſeven years, be renounced by the cautioner. As it is correctory, it is ſtrictly interpreted: Thus, bonds bearing a mutual clauſe of relief *pro rata*, fall not under it; nor bonds of corroboration, nor obligations, where the condition is not purified, or the term of payment not come within the ſeven years; becauſe no diligence can be uſed on theſe. The ſtatute excludes all cautionries for the faithful diſcharge of offices; theſe not being obligations in a bond or contract for ſums of money. And practice has denied the benefit of it to all judicial cautioners, as cautioners in a ſuſpenſion. Actions of count and reckoning, competent either to minors againſt their tutors or curators, or *vice verſa*, preſcribe in ten years after the majority or death of the minor.

9. Holograph bonds, miſſive letters, and books of account, not atteſted by witneſſes, preſcribe in twenty years, unleſs the creditor ſhall thereafter prove the verity of the ſubſcription by the debtor's oath. It is therefore ſufficient to ſave from the effect of this preſcription, that the conſtitution of the debt be proved by the party's oath, after the twenty years; whereas in ſtipends, merchants accounts, *&c.* not only the conſtitution, but the ſubſiſtence of the debt, muſt be proved by writing or the debtor's oath, after the term of preſcription. Some lawyers extend this preſcription of holograph writings to all obligations for ſums not exceeding L. 100 *Scots*, which are not atteſted by witneſſes; becauſe though theſe are in practice ſuſtained, yet they ought not to have the ſame duration with deeds atteſted by witneſſes. Though in the ſhort preſcriptions of debts, the right of action is forever loſt, if not exerciſed within the time limited; yet where action was brought on any of thoſe debts, before the preſcription was run, it ſubſiſted, like any other right, for forty years. As this defeated the purpoſe of the acts eſtabliſhing theſe preſcriptions, all proceſſes upon warnings, ſpuilzies, ejections, or arreſtments, or for payment of the debts contained in act 1669, *c.* 9. are by the ſaid act, joined with 1685, *c.* 14. declared to preſcribe in five years, if not wakened within that time; ſee Tit. 30.

10. Certain obligations are loſt by the lapſe of leſs than forty years, without the aid of ſtatute, where the nature of the obligation, and the circumſtances of parties, juſtify it: Thus, bills which are not intended for laſting ſecurities, produce no action, where the creditor has been long ſilent, unleſs the ſubſiſtence of the debt be proved by the debtor's oath; but the preciſe time is not fixed by practice. Thus alſo, a receipt for bills granted by a writer to his employer, not inſiſted upon for twenty-three years, was found not productive of an action. The preſcriptions of the reſtitution of minors, of the benefit of inventory, *&c.* are explained in their proper places.

11. In the poſitive preſcription, as eſtabliſhed by the act 1617, the continued poſſeſſion for forty years, proceeding upon a title of property not chargeable with falſehood, ſecures the poſſeſſor againſt all other grounds of challenge, and ſo preſumes *bona fides, præſumptione juris et de jure*. In the long negative preſcription, *bona fides* in the debtor is not required: The creditor's neglecting to inſiſt for ſo long a time, is conſtrued as an abandoning of his debt, and ſo is equivalent to a diſcharge. Hence, though the ſubſiſtence of the debt ſhould be referred to the debtor's own oath, after the forty years, he is not liable.

12. Preſcription runs *de momento in momentum*: The whole time defined by law muſt be compleated, before a right can be either acquired or loſt by it; ſo that interruption, made on the laſt day of the fortieth year, breaks its courſe. The poſitive preſcription runs againſt the Sovereign himſelf, even as to his annexed property, but it is generally thought he cannot ſuffer by the negative: He is ſecured againſt the negligence of his officers, in the management of proceſſes by expreſs ſtatute, 1600, *c.* 14. The negative, as well as the poſitive preſcription, runs againſt the church, though churchmen have but a temporary intereſt in their benefices. But becauſe the rights of beneficiaries to their ſtipends are liable to accidents, through the frequent change of incumbents, thirteen years poſſeſſion does, by a rule of the Roman chancery which we have adopted, found a preſumptive title in the beneficiary: But this is not properly preſcription; for if by titles recovered, perhaps out of the incumbent's own hands,

hands, it ſhall appear that he has poſſeſſed tithes, or other ſubjects, to a greater extent than he ought, his poſſeſſion will be reſtricted accordingly. This right muſt not be confounded with that eſtabliſhed in favour of churchmen, which is confined to church lands and rents, and conſtitutes a proper preſcription, upon a poſſeſſion of thirty years.

13. The clauſe in the act 1617, ſaving minors from preſcription, is extended to the poſitive, as well as to the negative preſcription; but the exception of minority is not admitted in the caſe of hoſpitals for children, where there is a continual ſucceſſion of minors, that being a *caſus inſolitus*. Minors are expreſsly excepted in ſeveral of the ſhort preſcriptions, as 1579, *c*. 81.——1669, *c*. 9.; but where law leaves them in the common caſe, they muſt be ſubject to the common rules.

14. Preſcription does not run *contra non valentem agere*, againſt one who is barred, by ſome legal incapacity, from purſuing; for in ſuch caſe, neither negligence nor dereliction can be imputed to him. This rule is, by a favourable interpretation, extended to wives who *ex reverentia maritali* forbear to purſue actions competent to them againſt their huſbands. On the ſame ground, preſcription runs only from the time that the debt or right could be ſued upon. Thus, inhibition preſcribes only from the publiſhing of the deed granted to the inhibiter's prejudice; and in the preſcription of removings, the years are computed only from the term at which the defender is warned to remove. Neither can preſcription run againſt perſons who are already in poſſeſſion, and ſo can gain nothing by a purſuit. Thus, where a perſon, who has two adjudications affecting the ſame lands, is in poſſeſſion upon one of them, preſcription cannot run againſt the other during ſuch poſſeſſion.

15. Certain rights are incapable of preſcription: 1. Things that law has exempted from commerce. 2. *Res meræ facultatis*, *e. g.* a faculty to charge a ſubject with debts, to revoke, *&c.* cannot be loſt by preſcription, for faculties may, by their nature, be exerciſed at any time: Hence, a proprietor's right of uſing any act of property on his own grounds, cannot be loſt by the greateſt length of time. 3. Exceptions competent to a perſon for eliding an action, cannot preſcribe, unleſs the exception is founded on a right productive of an action, *e. g.* compenſation; ſuch right muſt be inſiſted on, within the years of preſcription. 4. Obligations of yearly penſions or payments, though no demand has been made on them for forty years, do not ſuffer a total preſcription, but ſtill ſubſiſt as to the arrears fallen due within that period; becauſe preſcription cannot run againſt an obligation, till it be payable, and each year's penſion or payment is conſidered as a ſeparate debt.

16. No right can be loſt *non utendo* by one, unleſs the effect of that preſcription be to eſtabliſh it in another. Hence the rule ariſes, *juri ſanguinis nunquam præſcribitur*. Hence alſo, a proprietor of land cannot loſe his property by the negative preſcription, unleſs he who objects it can himſelf plead the poſitive. On the ſame ground, a ſuperior's right of feu-duties cannot be loſt *non utendo*; becauſe being inherent in the ſuperiority, it is truly a right of lands that cannot ſuffer the negative preſcription, except in favour of one who can plead the poſitive; which the vaſſal cannot do, being deſtitute of a title. This rule applies alſo to parſonage tithes, which are an inherent burden upon all lands not ſpecially exempted; and from which therefore the perſon liable cannot preſcribe an immunity, by bare non-payment: But ſuch vicarage tithes as are only due where they are eſtabliſhed by uſage, may be loſt by preſcription. In all theſe caſes, though the radical right cannot ſuffer the negative preſcription, the bygone duties, not demanded within the forty years, are loſt to the proprietor, ſuperior, or titular.

17. Preſcription may be interrupted by any deed, whereby the proprietor or creditor uſes his right or ground of debt. In all interruptions, notice muſt be given to the poſſeſſor of the ſubject, or the debtor, that the proprietor or creditor intends to ſue upon his right. All writings whereby the debtor himſelf acknowledges the debt, and all proceſſes for payment brought or diligences uſed againſt him upon his obligation, by horning, inhibition, arreſtment, *&c.* muſt be effectual to interrupt preſcription.

18. Interruptions, by citation upon libelled ſummonſes, where they are not uſed by a minor, preſcribe, if not renewed every ſeven years: But where the appearance of parties, or any judicial act has followed thereupon, it is no longer a bare citation, but an action which ſubſiſts for forty years. Citations for interrupting the preſcription of real rights muſt be given by meſſengers; and the ſummonſes, on which ſuch citations proceed, muſt paſs the ſignet upon a bill, and be regiſtred within ſixty days after the execution, in a particular regiſter appointed for that purpoſe: And where interruption of real rights is made *via facti*, an inſtrument muſt be taken upon it, and recorded in the ſaid regiſter; otherwiſe it can have no effect againſt ſingular ſucceſſors.

19. Interruption has the effect to cut off the courſe of preſcription, ſo that the perſon preſcribing can avail himſelf of no part of the former time, but muſt begin a new courſe, commencing from the date of the interruption. Minority therefore is no proper interruption; for it neither breaks the courſe of preſcription, nor is it a document or evidence taken by the minor on his right: It is a perſonal privilege competent to him, by which the operation of the preſcription is indeed ſuſpended during the years of minority, which are therefore diſcounted from it; but it continues to run after majority, and the years before and after the minority may be conjoined to compleat it. The ſame doctrine applies to the privilege ariſing from one's incapacity to act.

20. Diligence uſed upon a debt, againſt any one of two or more co-obligants, preſerves the debt itſelf, and ſo interrupts preſcription againſt all of them; except in the ſpecial caſe of cautioners, who are not affected by any diligence uſed againſt the principal debtor. In the ſame manner, a right of annualrent, conſtituted upon two ſeparate tenements, is preſerved as to both from the negative preſcription, by diligence uſed againſt either of them. But whether ſuch diligence has alſo the effect to hinder the poſſeſſor of the other tenement by ſingular titles from the benefit of the poſitive preſcription, may be doubted.

Tit. 27. *Of Succession in heritable Rights.*

Singular successors are those who succeed to a person yet alive, in a special subject by singular titles; but succession, in its proper sense, is a method of transmitting rights from the dead to the living. Heritable rights descend by succession to the heir properly so called; moveable rights, to the executors, who are sometimes said to be heirs in moveables. Succession is either by special destination, which descends to those named by the proprietor himself; or legal, which devolves upon the persons whom the law marks out for successors, from a presumption, that the proprietor would have named them, had he made a destination. The first is in all cases preferred to the other, as presumption must yield to truth.

2 In the succession of heritage, the heirs at law are otherwise called heirs general, heirs whatsoever, or heirs of line; and they succeed by the right of blood, in the following order. First, descendents sons are prefered to daughters, and the eldest son to all the younger. Where there are daughters only, they succeed equally, and are called heirs-portioners. Failing immediate descendents, grand-children succeed; and in default of them, great-grand-children; and so on *in infinitum*; preferring, as in the former case, males to females, and the eldest male to the younger.

3. Next after descendents, collaterals succeed; among whom the brothers *german* of the deceased have the first place. But as, in no case, the legal succession of heritage is, by the law of Scotland, divided into parts, unless where it descends to females; the immediate younger brother of the deceased excludes the rest, according to the rule, *heritage descends*. Where the deceased is himself the youngest, the succession goes to the immediate elder brother, as being the least deviation from this rule. If there are are no brothers german, the sisters german succeed equally; then brothers *consanguinean*, in the same order as brothers german; and failing them, sisters *consanguinean* equally. Next, the father succeeds. After him, his brothers and sisters, according to the rules already explained; then the grand-father; failing him, his brothers and sistters; and so upwards, as far back as propinquity can be proved. Though children succeed to their mother, a mother cannot to her child; nor is there any succession by our law through the mother of the deceased; in so much that one brother *uterine*, *i. e.* by the mother only, cannot succeed to another, even in that estate which flowed originally from their common mother.

4. In heritage there is a right of representation, by which one succeeds, not from any title in himself, but in the place of, and as representing some of his deceased ascendents. Thus, where one leaves a younger son, and a grandchild by his eldest, the grandchild, though farther removed in degree from the decased than his uncle, excludes him, as coming in place of his father the eldest son. Hence arises the distinction between succession *in capita*, where the division is made into as many equal parts as there are *capita* or heirs, which is the case of heirs portioners; and succession *in stirpes*, where the remoters heirs draw no more among them than the share belonging to their ascendent or *stirps*, whom they represent; an example of which may be figured in the case of one who leaves behind him a daughter alive, and two grand-daughters by a daughter deceased. In which case the two grand-daughters would succeed equally to that half which would have belonged to their mother had she been alive.

5. In the succession of heirs-portioners, indivisible rights, *e. g.* titles of dignity, fall to the eldest sister. A single right of superiority goes also to the eldest; for it hardly admits a division, and the condition of the vassal ought not to be made worse by multiplying superiors upon him. Where there are more such rights, the eldest may perhaps have her election of the best; but the younger sisters are entitled to a recompence, in so far as the divisions are unequal; at least, where the superiorities yield a constant yearly rent. The principal seat of the family falls to the eldest, with the garden and orchard belonging to it, without recompence to the younger sisters; but all other houses are divided amongst them, together with the lands on which they are built, as parts and pertinents of these lands.

6. Those heritable rights, to which the deceased did himself succeed as heir to his father or other ancestor, get sometimes the name of heritage in a strict sense, in opposition to the *feuda nova*, or feus of conquest, which he had acquired by singular titles, and which descend, not to his heir of line, but of conquest. This distinction obtains only, where two or more brothers or uncles, or their issue, are next in succession; in which case the immediate younger brother, as heir of line, succeeds to the proper heritage, because that descends; whereas the conquest ascends to the immediate elder brother. It has no place in female succession, which the law divides equally among the heirs-portioners. Where the deceased was the younger brother, the immediate elder brother is heir both of line and of conquest. An estate, disponed by a father to his eldest son, is not conquest in the son's person, but heritage; because the son would have succeeded to it, though there had been no disposition. The heir of conquest succeeds to all rights affecting land, which require seisin to perfect them. But teinds go to the heir of line; because they are merely a burden on the fruits, not on the land. Tacks do not fall under conquest, because they are complete rights without seisin; nor personal bonds taken to heirs secluding executors.

7. The heir of line is entitled to the succession, not only of subjects properly heritable, but to that sort of moveables called *heirship*, which is the best of certain kinds. This doctrine has been probably introduced, that the heir might not have an house and estate to succeed to, quite dismantled by the executor. In that sort which goes by pairs or dozens, the best pair or dozen is the heirship. There is no heirship in fungibles, or things estimated by quantity, as grain, hay, current money, *&c.* To intitle an heir to this privilege, the deceased must have been either, 1. A Prelate: 2. A Baron, *i. e.* one who stood infeft at his death in lands, though not erected into a barony; or even in a right of annualrent: Or, 3. A burgess; not an honorary one, but a trading burgess of a royal borough, or at least one intitled to enter burgess,

gefs, in the right of his anceftor. Neither the heir of conqueft, nor of tailzie, has right to heirfhip-moveables.

8. As to fucceffion by deftination, no proprietor can fettle any heritable eftate, in the proper form of a teftament; not even bonds fecluding executors, though thefe are not heritable *ex fua natura*: But, where a teftament is in part drawn up in the ftyle of a deed *inter vivos*, fuch part of it may contain a fettlement of heritage, though executors fhould be named in the teftamentary part. The common method of fettling the fucceffion of heritage is by difpofition, contract of marriage, or fimple procuratory of refignation: And, though a difpofition fettling heritage fhould have neither precept nor procuratory, it founds an action againft the heir of line to complete his titles to the eftate; and thereafter diveft himfelf in favour of the difponee. The appellation of tailzie, or entail, is chiefly ufed in the cafe of a land eftate, which is fettled on a long feries of heirs, fubftituted one after another. The perfon firft called in the tailzie, is the inftitute; the reft, the heirs of tailzie, or the fubftitutes.

9. Tailzies, when confidered in relation to their feveral degrees of force, are either, 1. Simple deftinations: 2. Tailzies with prohibitory claufes. 3. Tailzies with prohibitory, refolutive, and irritant claufes That is a fimple deftination, where the perfons called to the fucceffion are fubftituted one after another, without any reftraint laid on the exercife of their property The heirs, therefore, fucceeding to fuch eftate, are abfolute fiars, and confequently may alter the deftination at pleafure.

10. In tailzies with claufes prohibitory, *e.g.* declaring that it fhall not be lawful to the heirs to contract debts or alien the lands in prejudice of the fucceffion, none of the heirs can alien gratuitoufly. But the members of entail may contract debts which will be effectual to the creditors, or may difpofe of the eftate for onerous caufes. In both thefe forts, the maker himfelf may alter the tailzie; except, 1. Where it has been granted for an onerous caufe, as in mutual tailzies; or, 2. Where the maker is exprefsly difabled, as well as the inftitute or the heirs.

11. Where a tailzie is guarded with irritant and refolutive claufes, the eftate entailed cannot be carried off by the debt, or deed, of any of the heirs fucceeding thereto, in prejudice of the fubftitutes. It was long doubted, whether fuch tailzies ought to be effectual, even where the fuperior's confent was adhibited; becaufe they funk the property of eftates, and created a perpetuity of liferents. They were firft explicitely authorifed by 1685, *c.* 22. By this ftatute, the entail muft be regiftred in a fpecial regifter eftablifhed for that purpofe; and the irritant and refolutive claufes muft be inferted, not only in the procuratories, precepts, and feifins, by which the tailzies are firft conftituted, but in all the after-conveyances thereof; otherwife they can have no force againft fingular fucceffors. But a talzie, even without thefe requifites, is effectual againft the heir of the granter, or againft the inftitute who accepts of it.

12. An heir of entail has full power over the entailed eftate, except in fo far as he is exprefsly fettered; and as entails are an unfavourable reftraint upon property, and a frequent fnare to trading people, they are *ftrictiffimi juris*; fo that no prohibition or irritancies are to be inferred by implication.

13. An heir, who counteracts the directions of the tailzie, by aliening any part of the eftate, charging it with debt, *&c.* is faid to contravene. It is not the fimple contracting of debt that infers contravention; the lands entailed muft be actually adjudged upon the debt contracted. An heir may, where he is not exprefsly barred, fettle rational provifions on his wife and children, without incurring contravention.

14. When the heirs of the laft perfon fpecially called in a tailzie come to fucceed, the irritancies have no longer any perfon in favour of whom they can operate; and confequently, the fee, which was before tailzied, becomes fimple and unlimited in the perfon of fuch heirs. The King may purchafe lands within Scotland, notwithftanding the ftricteft entail; and where the lands are in the hands of minors or fatuous perfons, his Majefty may purchafe them from the curators or guardians. And heirs of entail may fell to their vaffals the fuperiorities belonging to the entailed eftate; but in all thefe cafes, the price is to be fettled in the fame manner that the lands or fuperiorities fold were fettled before the fale.

15. Rights, not only of land-eftates, but of bonds, are fometimes granted to two or more perfons in conjunct fee. Where a right is fo granted to two ftrangers, without any fpecial claufe adjected to it, each of them has an equal intereft in the fee, and the part of the deceafed defcends to his own heir. If the right be taken to the two jointly, and *the longeft liver* and their heirs, the feveral fhares of the conjunct fiars are affectable by their creditors during their lives; but, on the death of any one of them, the furvivor has the fee of the whole, in fo far as the fhare of the predeceafed remains free, after payment of his debts. Where the right is taken to the two in conjunct fee, and to the heirs of one of them, he to whofe heirs the right is taken, is the only fiar; the right of the other refolves into a fimple liferent: Yet where a father takes a right to himfelf and his fon jointly, and to the fon's heirs, fuch right being gratuitous is not underftood to ftrip the father of the fee, unlefs a contrary intention fhall plainly appear from the tenor of the right.

16. Where a right is taken to a hufband and wife, in conjunct fee and liferent, the hufband, as the *perfona dignior*, is the only fiar: The wife's right refolves into a liferent, unlefs it be prefumeable, from fpecial circumftances, that the fee was intended to be in the wife. Where a right of moveables is taken to hufband and wife, the heirs of both fucceed equally, according to the natural meaning of the words.

17. Heirs of provifion are thofe who fucceed to any fubject, in virtue of a provifion in the inveftiture, or other deed of fettlement This appellation is given moft commonly to heirs of a marriage Thefe are more favourably regarded than heirs by fimple deftination, who have only the hope of fucceffion; for heirs of a marriage, becaufe their provifions are conftituted by an onerous contract, cannot be difappointed of them by any gratuitous deed of the father. Neverthelefs, as their right is only a right of fucceffion, which is not defigned to reftrain the father

father from granting onerous or rational deeds, he continues to have the full power of felling the fubject, or charging it with debts, unlefs a proper right of credit be given to the heir by the marriage-contract, *e. g.* if the father fhould oblige himfelf to infeft the heir in the lands, or make payment of the fum provided againft a day certain, or when the child attains a certain age, *&c.* for fuch rights, when perfected by infeftment, or fecured by diligence, are effectual againft all the pofterior deeds of the father, even onerous.

18. Though all provifions to children, by a marriage-contract conceived in the ordinary form, being merely rights of fucceffion, are poftponed to every onerous debt of the granter, even to thofe contracted pofterior to the provifions; yet where a father executes a bond of provifion to a child actually exifting, whether fuch child be the heir of a marriage or not, a proper debt is thereby created, which, though it be without doubt gratuitous, is not only effectual againft the father himfelf and his heirs, but is not reducible at the inftance even of his prior onerous creditors, if he was folvent at the time of granting it. A father may, notwithftanding a firft marriage-contract, fettle a jointure on a fecond wife, or provide the children of a fecond marriage; for fuch fettlements are deemed onerous; but where they are exorbitant, they will be reftricted to what is rational: And in all fuch fettlements, where the provifions of the firft marriage-contract are incroached upon, the heirs of that marriage have recourfe againft the father, in cafe he fhould afterwards acquire a feparate eftate, which may enable him to fulfil both obligations.

19. Where heritable rights are provided to the *heirs* of a marriage, they fall to the eldeft fon, for he is the heir at law in heritage. Where a fum of money is fo provided, the word *heir* is applied to the fubject of the provifion, and fo marks out the executor, who is the heir in moveables. When an heritable right is provided to the *bairns* (or iffue) of a marriage, it is divided equally among the children, if no divifion be made by the father; for fuch deftination cuts off the exclufive right of the legal heir. No provifion granted to bairns, gives a fpecial right of credit to any one child, as long as the father lives: The right is granted *familiæ*; fo that the whole muft indeed go to one or other of them; but the father has a power inherent in him, to divide it among them, in fuch proportions as he thinks beft; yet fo as none of them may be entirely excluded, except in extraordinary cafes.

20. A claufe of return is that, by which a fum in a bond or other right, is, in a certain event, limited to return to the granter himfelf, or his heirs. When a right is granted for onerous caufes, the creditor may defeat the claufe of return, even gratuitoufly. But, where the fum in the right flows from the granter, or where there is any other reafonable caufe for the provifion of return in his favour, the receiver cannot difappoint it gratuitoufly. Yet fince he is fiar, the fum may be either affigned by him for an onerous caufe, or affected by his creditors.

21. An heir is, in the judgment of law, *eadem perfona cum defuncto*, and fo reprefents the deceafed univerfally, not only in his rights, but in his debts: In the firft view, he is faid to be heir *active;* in the fecond *paffive*. From this general rule are excepted, heirs fubftituted in a fpecial bond, and even fubftituted in a difpofition *omnium bonorum*, to take effect at the granter's death; for fuch fubftitutes are confidered as fingular fucceffors, and their right as an univerfal legacy, which does not fubject the legatee *ultra valorem*.

22. Before an heir can have an active title to his anceftor's rights, he muft be entered by fervice and retour. He who is intitled to enter heir, is, before his actual entry, called apparent heir. The bare right of apparency carries certain privileges with it. An apparent heir may defend his anceftor's titles againft any third party who brings them under challenge. Tenants may fafely pay him their rents; and after they have once acknowledged him by payment, he may compel them to continue it; and the rents not uplifted by the apparent heir belong to his executors, upon his death.

23. As an heir is, by his entry, fubjected univerfally to his anceftor's debts, apparent heirs have therefore a year (*annus deliberandi*) allowed to them from the anceftor's deceafe, to deliberate whether they will enter or not; till the expiring of which, though they may be charged by creditors to enter, they cannot be fued in any procefs founded upon fuch charge. Though declaratory actions, and others which contain no perfonal conclufion, may be purfued againft the apparent heir, without a previous charge; action does not lie even upon thefe, within the year, if the heir cannot make the proper defences without incurring a paffive title. But judicial fales, commenced againft an anceftor, may be continued upon a citation of the heir, without waiting the year of deliberating. This *annus deliberandi* is computed, in the cafe of a pofthumous heir, from the birth of fuch heir. An apparent heir, who by immixing with the eftate of his anceftor, is as much fubjected to his debts as if he had entered, can have no longer a right to deliberate whether he will enter or not.

24. All fervices proceed on brieves from the chancery, which are called brieves of inqueft, and have been long known in Scotland. The judge, to whom the brief is directed, is required to try the matter by an inqueft of fifteen fworn men. The inqueft, if they find the claim verified, muft declare the claimant heir to the deceafed, by a verdict or fervice, which the judge muft atteft, and return the brief, with the fervice proceeding on it, to the chancery.

25. The fervice of heirs is either general or fpecial. A general fervice vefts the heir in the right of all heritable fubjects, which either do not require feifin, or which have not been perfected by feifin in the perfon of the anceftor. A fpecial fervice, followed by feifin, vefts the heir in the right of the fpecial fubjects in which the anceftor died infeft.

26. If an heir, doubtful whether the eftate of his anceftor be fufficient for clearing his debts, fhall at any time within the *annus deliberandi*, exhibit upon oath a full inventory of all his anceftor's heritable fubjects, to the clerk of the fhire where the lands lie; or, if there is no heritage requiring feifin, to the clerk of the fhire where he died; and if, after the fame is fubfcribed by the fheriff

riff or sheriff depute, the clerk, and himself, and registered in the sheriff's books, the extract thereof shall be registered within forty days after expiry of the *annus deliberandi* in the general register appointed for that purpose, his subsequent entry will subject him no farther than to the value of such inventory. If the inventory be given up and registred within the time prescribed, the heir may serve on it, even after the year.

27. Creditors are not obliged to acquiesce in the value of the estate given up by the heir; but, if they be real creditors, may bring the estate to a public sale, in order to discover its true value; since an estate is always worth what can be got for it. An heir by inventory, as he is, in effect, a trustee for the creditors, must account for that value to which the estate may have been improved since the death of the ancestor, and he must communicate to all the creditors the eases he has got in transacting with any one of them.

28. Practice has introduced an anomalous sort of entry, without the interposition of an inquest, by the sole consent of the superior, who, if he be satisfied that the person applying to him is the next heir, grants him a precept (called of *clare constat*, from the first words of its recital), commanding his bailie to infeft him in the subjects that belonged to his ancestor. These precepts are, no doubt, effectual against the superior who grants them, and his heirs; and they may, when followed by seisin, afford a title of prescription: But as no person can be declared an heir by private authority, they cannot bar the true heir from entering after twenty years, as a legal entry would have done. Of the same nature is the entry by hasp and staple, commonly used in burgage tenements of houses; by which the bailie, without calling an inquest, cognosces or declares a person heir, upon evidence brought before himself; and, at the same time, infefts him in the subject, by the symbol of the hasp and staple of the door. Charges given by creditors to apparent heirs to enter, stand in the place of an actual entry, so as to support the creditor's diligence.

29. A general service cannot include a special one; since it has no relation to any special subject, and carries only that class of rights on which seisin has not proceeded; but a special service implies a general one of the same kind or character, and consequently carries even such rights as have not been perfected by seisin. Service is not required to establish the heir's right in titles of honour, or offices of the highest dignity; for these descend *jure sanguinis*.

30. An heir, by immixing with his ancestor's estate without entry, subjects himself to his debts, as if he had entered; or, in our law-phrase, incurs a passive title. The only passive title by which an apparent heir becomes liable universally for all his ancestor's debts, is *gestio pro herede*, or his behaving as none but an heir has right to do. Behaviour as heir is inferred, from the apparent heir's intromission, after the death of the ancestor, with any part of the lands or other heritable subjects belonging to the deceased, to which he himself might have compleated an active title by entry.

31. This passive title is excluded, if the heir's intromission be by order of law; or if it be founded on singular titles, and not as heir to the deceased. But an apparent heir's purchasing any right to his ancestor's estate, otherwise than at public roup (auction), or his possessing it in virtue of rights settled in the person of any near relation of the ancestor, to whom he himself may succeed as heir, otherwise than upon purchase by public sale, is deemed behaviour as heir.

32. Behaviour as heir is also excluded, where the intromission is small, unless an intention to defraud the ancestor's creditors be presumable from the circumstances attending it. Neither is behaviour inferred against the apparent heir, from the payment of his ancestor's debt, which is a voluntary act, and profitable to the creditors: nor by his taking out of brieves to serve; for one may alter his purpose, while it is not compleated: nor by his assuming the titles of honour belonging to his ancestor, or exercising an honorary office hereditary in the family; for these are rights annexed to the blood, which may be used without proper representation. But the exercising an heritable office of profit, which may pass by voluntary conveyance, and consequently is adjudgeable, may reasonably be thought to infer a passive title. Lastly, as passive titles have been introduced, merely for the security of creditors; therefore, where questions concerning behaviour arise among the different orders of heirs, they are liable to one another no farther than *in valorem* of their several intromissions.

33. Another passive title in heritage, may be incurred by the apparent heir's accepting a gratuitous right from the ancestor, to any part of that estate to which he himself might have succeeded as heir; and it is called *præceptio hereditatis*, because it is a taking of the succession by the heir before it opens to him by the death of his ancestor. If the right be onerous, there is no passive title; If the consideration paid for it does not amount to its full value, the creditors of the deceased may reduce it, in so far as it is gratuitous, but still it infers no passive title.

34. The heir incurring this passive title is no farther liable, than if he had, at the time of his acceptance, entered heir to the granter, and so subjected himself to the debts that were then chargeable against him; but with the posterior debts he has nothing to do, not even with those contracted between the date of the right, and the infeftment taken upon it, and he is therefore called *successor titulo lucrativo post contractum debitum*.

35. Neither of these passive titles takes place, unless the subject intermeddled with or disponed, be such as the intromitter or receiver would succeed to as heir, In this also, these two passive titles agree, that the intromission in both must be after the death of the ancestor; for there can be no *termini habiles* of a passive title, while the ancestor is alive. But in the following respect they differ: *Gestio pro herede*, being a vicious passive title founded upon a quasi delict, cannot be objected against the delinqent's heir, if process has not been litiscontested while the delinquent himself was alive; whereas the *successor titulo lucrativo* is, by the acceptance of the disposition, understood to have entered into a tacit contract with the granter's creditors, by which he undertakes the burden of their debts; and all actions founded on contract are transmissible against heirs.

36. An

36. An apparent heir, who is cited by the anceſtor's creditor in a proceſs for payment, if he offers any peremptory defence againſt the debt, incurs a paſſive title; for he can have no intereſt to object againſt it, but in the character of heir. In the ſame manner, the heir's not renouncing upon a charge to enter heir, infers it: But the effect of both theſe is limited to the ſpecial debt purſued for, or charged upon. This paſſive title, which is inferred from the heir's not renouncing, has no effect till decree paſs againſt him; and even a renunciation offered after decree, if the decree be in abſence, will intitle the heir to a ſuſpenſion of all diligence againſt his perſon and eſtate, competent upon his anceſtor's debts.

37. By the principles of the feudal law, an heir, when he is to compleat his titles by ſpecial ſervice, muſt neceſſarily paſs over his immediate anceſtor, *e. g.* his father, if he was not infeft; and ſerve heir to that anceſtor who was laſt veſt and ſeiſed in the right, and in whoſe *hereditas jacens* the right muſt remain, till a title be connected thereto from him. As this bore hard upon creditors, who might think themſelves ſecure in contracting with a perſon whom they ſaw for ſome time in the poſſeſſion of an eſtate, and from thence conclude that it was legally veſted in him; it is therefore provided, that every perſon, paſſing over his immediate anceſtor who had been three years in poſſeſſion, and ſerving heir to one more remote, ſhall be liable for the debts and deeds of the perſon interjected, to the value of the eſtate to which he is ſerved. This being correctory of the feudal maxims, has been ſtrictly interpreted, ſo as not to extend to the gratuitous deeds of the perſon interjected, nor to the caſe where the interjected perſon was a naked fiar, and poſſeſſed only civilly through the liferenter

38. Our law, from its jealouſy of the weakneſs of mankind while under ſickneſs, and of the importunity of friends on that occaſion, has declared that all deeds affecting heritage, if they be granted by a perſon on death-bed, (*i. e.* after contracting that ſickneſs which ends in death), to the damage of the heir, are ineffectual, except where the debts of the granter have laid him under a neceſſity to alien his lands. As this law of deathbed is founded ſolely in the privilege of the heir, deathbed-deeds, when conſented to by the heir, are not reducible. The term properly oppoſed to death-bed is *liege pouſtie*, by which is underſtood a ſtate of health; and it gets that name, becauſe perſons in health have the *legitima poteſtas*, or lawful power of diſpoſing of their property at pleaſure.

39. The two extremes being proved, of the granter's ſickneſs immediately before ſigning, and of his death following it, though at the greateſt diſtance of time, did, by our former law, found a preſumption that the deed was granted on death bed, which could not have been elided, but by a poſitive proof of the granter's convaleſcence; but now the allegation of death-bed is alſo excluded, by his having lived ſixty days after ſigning the deed. The legal evidence of convaleſcence is the granter's having been, after the date of the deed, at kirk *OR* market unſupported; for a proof of either will ſecure the deed from challenge. The going to kirk or market muſt be performed, when people are met together in the church or churchyard for any public meeting, civil or eccleſiaſtical, or in the market place at the time of public market. No other proof of convaleſcence is receiveable, becauſe at kirk and market there are always preſent unſuſpected witneſſes, which we can hardly be ſure of in any other caſe.

40. The privilege of ſetting aſide deeds *ex capite lecti*, is competent to all heirs, not to heirs of line only, but of conqueſt, tailzie, or proviſion; not only to the immediate, but to remoter heirs, as ſoon as the ſucceſſion opens to them. But, where it is conſented to or ratified by the immediate heir, it is ſecured againſt all challenge, even from the remoter. Yet the immediate heir cannot, by any antecedent writing, renounce his right of reduction, and thereby give ſtrength to deeds that may be afterwards granted *in lecto* to his hurt; for no private renunciation can authoriſe a perſon to act contrary to a public law; and ſuch renunciation is preſumed to be extorted through the fear of exheredation. If the heir ſhould not uſe this privilege of reduction, his creditor may, by adjudication, transfer it to himſelf, or he may without adjudication, reduce the deed, libelling upon his intereſt as creditor to the heir: But the granter's creditors have no right to this privilege, in regard that the law of death-bed was introduced, not in behalf of the granter himſelf, but of his heir.

41. The law of death-bed ſtrikes againſt diſpoſitions of every ſubject to which the heir would have ſucceeded, or from which he would have had any benefit, had it not been ſo diſponed. Deathbed-deeds granted in conſequence of a full or proper obligation in *liege pouſtie*, are not ſubject to reduction; but, where the antecedent obligation is merely natural, they are reducible. By ſtronger reaſon, the deceaſed cannot, by a deed merely voluntary, alter the nature of his eſtate on death bed to the prejudice of his heir, ſo as from heritable to make it moveable; but if he ſhould, in *liege pouſtie*, exclude his apparent heir, by an irrevocable deed containing reſerved faculties, the heir cannot be heard to quarrel the exerciſe of theſe faculties on death-bed.

42. In a competition between the creditors of the deceaſed and of the heir, our law has juſtly preferred the creditors of the deceaſed, as every man's eſtate ought to be liable, in the firſt place, for his own debt. But this preference is, by the ſtatute, limited to the caſe where the creditors of the deceaſed have uſed diligence againſt their debtor's eſtate, within three years from his death; and therefore the heir's creditors may, after that period, affect it for their own payment. All diſpoſitions by an heir, of the anceſtor's eſtate, within a year after his death, are null, in ſo far as they are hurtful to the creditors of the anceſtor. This takes place, though theſe creditors ſhould have uſed no diligence, and even where the diſpoſitions are granted after the year: It is thought they are ineffectual againſt the creditors of the deceaſed who have uſed diligence within the three years.

Tit. 28. *Of Succeſſion in Moveables.*

In the ſucceſſion of moveable rights, it is an univerſal rule,

rule, that the next in degree to the deceafed (or next of kin) fucceeds to the whole; and if there are two or more equally near, all of them fucceed by equal parts, without that prerogative, which takes place in heritage, of the eldeft fon over the younger, or of males over females. Neither does the right of reprefentation, explained Tit. xxvii. 4 obtain in the fucceffion of moveables, except in the fingle cafe of a competition between the full blood and the half blood; for a niece by the full blood will be preferred before a brother by the half blood, though fhe is by one degree more remote from the deceafed than her uncle. Where the eftate of a perfon deceafed confifts partly of heritage, and partly of moveables, the heir in the heritage has no fhare of the moveables, if there are others as near in degree to the deceafed as himfelf: But where the heir, in fuch cafe, finds it his intereft to renounce his exclufive claim to the heritage, and betake himfelf to his right as one of the next of kin, he may collate or communicate the heritage with the others, who in their turn muft collate the moveables with him; fo that the whole is thrown into one mafs, and divided equally among all of them. This doctrine holds, not only in the line of defcendents, but of collaterals; for it was introduced, that the heir might in no cafe be worfe than the other next of kin.

2. One may fettle his moveable eftate upon whom he pleafes, excluding the legal fucceffor, by a teftament; which is a written declaration of what a perfon wills to be done with his moveable eftate after his death. No teftamentary deed is effectual, till the death of the teftator; who may therefore revoke it at pleafure, or make a new one, by which the firft lofes its force; and hence teftaments are called, laft or latter wills. Teftaments, in their ftrict acceptation, muft contain a nomination of executors, *i. e.* of perfons appointed to adminifter the fucceffion according to the will of the deceafed: Yet nothing hinders one from making a fettlement of moveables, in favour of an univerfal legatee, though he fhould not have appointed executors; and on the other part, a teftament where executors are appointed, is valid, though the perfon who is to have the right of fucceffion fhould not be named. In this laft cafe, if the executor nominated be a ftranger, *i. e.* one who has no legal intereft in the moveable eftate, he is merely a truftee, accountable to the next of kin; but he may retain a third of the dead's part (explained § 6.) for his trouble in executing the teftament; in payment of which, legacies, if any be left to him, muft be imputed. The heir, if he be named executor, has right to the third as a ftranger; but if one be named, who has an intereft in the legal fucceffion, he has no allowance, unlefs fuch intereft be lefs than a third. Nuncupative or verbal teftaments are not, by the law of Scotland, effectual for fupporting the nomination of an executor, let the fubject of the fucceffion be ever fo fmall: But verbal legacies, not exceeding *L.* 100 *Scots*, are fuftained; and even where they are granted for more, they are ineffectual only as to the excefs.

3. A legacy is a donation by the deceafed, to be paid by the executor to the legatee. It may be granted, either in the teftament, or in a feparate writing. Legacies are not due till the granter's death; and confequently they can tranfmit no right to the executors of the legatee, in the event that the granter furvives him.

4. Legacies, where they are general, *i. e.* of a certain fum of money indefinitely, give the legatee no right in any one debt or fubject; he can only infift in a perfonal action againft the executor, for payment out of the teftator's effects. A fpecial legacy, *i. e.* of a particular debt due to the deceafed, or of a particular fubject belonging to him, is of the nature of an affignation, by which the property of the fpecial debt or fubject vefts, upon the teftator's death, in the legatee, who can therefore directly fue the debtor or poffeffor: Yet as no legacy can be claimed till the debts are paid, the executor muft be cited in fuch procefs, that it may be known, whether there are free effects fufficient for anfwering the legacy. Where there is not enough for payment of all the legacies, each of the general legatees muft fuffer a proportional abatement: But a fpecial legatee gets his legacy entire, though there fhould be nothing over for payment of the reft; and on the contrary, he has no claim, if the debt or fubject bequeathed fhould perifh, whatever the extent of the free executry may be.

5. Minors, after puberty, can teft without their curators, wives without their hufbands, and perfons interdicted without their interdictors; but baftards cannot teft, except in the cafes afterwards fet forth, Tit. xxix. 3. As a certain fhare of the goods, falling under the communion that is confequent on marriage, belongs, upon the hufband's deceafe, to his widow, *jure relictæ*, and a certain fhare to the children, called the legitime, portion-natural, or bairns part of gear; one who has a wife or children, though he be the abfolute adminiftrator of all thefe goods during his life, and confequently may alien them by a deed *inter vivos* in *liege pouftie*, even gratuitoufly, if no fraudulent intention to difappoint the wife or children fhall appear, yet cannot impair their fhares gratuitoufly on deathbed; nor can he difpofe of his moveables to their prejudice by teftament, though it fhould be made in *liege pouftie*; fince teftaments do not operate till the death of the teftator, at which period the divifion of the goods in communion have their full effect in favour of the widow and children.

6. If a perfon deceafed leaves a widow, but no child, his teftament, or, in other words, the goods in communion, divide in two; one half goes to the widow, the other is the dead's part, *i. e.* the abfolute property of the deceafed, on which he can teft, and which falls to his next of kin, if he dies inteftate. Where he leaves children, one or more, but no widow, the children get one half as their legitime; the other half is the dead's part, which falls alfo to the children, if the father has not tefted upon it. If he leaves both widow and children, the divifion is tripartite; the wife takes one third by herfelf; another falls, as legitime, to the children equally among them, or even to an only child, though he fhould fucceed to the heritage; the remaining third is the dead's part. Where the wife predeceafes without children, one half is retained by the hufband, the other falls to her next of kin: Where fhe leaves children, the divifion ought alfo to be bipartite, by the common rules of fociety, fince no legitime is truly due on a mother's death;

yet

yet it is in practice tripartite; two thirds remain with the surviving father, as if one third were due to him *proprio nomine*, and another as administrator of the legitime for his children; the remaining third, being the wife's share, goes to her children, whether of that or any former marriage, for they are all equally her next of kin.

7. Before a testament can be divided, the debts owing by the deceased are to be deducted; for all executry must be free. As the husband has the full power of burdening the goods in communion, his debts affect the whole, and so lessen the legitime and the share of the relict, as well as the dead's part. His funeral charges, and the mournings and alimony due to the widow, are considered as his proper debts but the legacies, or other gratuitous rights, granted by him on deathbed, affect only the dead's part. Bonds bearing interest, due by the deceased. cannot diminish the relict's share, because such bonds when due to the deceased. do not increase it The funeral charges of the wife predeceasing, fall wholly on her executors who have right to her share. Where the deceased leaves no family, neither husband, wife, nor child, the testament suffers no division, but all is the dead's part.

8. The whole issue of the husband, not only by that marriage which was dissolved by his death, but by any former marriage, has an equal interest in the legitime; otherwise the children of the first marriage would be cut out, as they could not claim the legitime during their father's life. But no legitime is due, 1. Upon the death of a mother. 2. Neither is it due to grandchildren, upon the death of a grandfather. Nor, 3. To children forisfamiliated, *i. e.* to such as, by having renounced the legitime, are no longer considered as *in familia*, and so are excluded from any farther share of the moveable estate than they have already received.

9 As the right of legitime is strongly founded in nature, the renunciation of it is not to be inferred by implication. Renunciation by a child of his claim of legitime has the same effect as his death, in favour of the other children intitled thereto; and consequently the share of the renouncer divides among the rest; but he does not thereby lose his right to the dead's part, if he does not also renounce his share in the father's executry Nay, his renunciation of the legitime, where he is the only younger child, has the effect to convert the whole subject thereof into dead's part, which will therefore fall to the renouncer himself as next of kin, if the heir be not willing to collate the heritage with him.

10 For preserving an equality among all the children, who continue intitled to the legitime, we have adopted the Roman doctrine of *collatio bonorum*; whereby the child, who has got a provision from his father, is obliged to collate it with the others, and impute it towards his own share of the legitime; but if, from the deed of provision, the father shall appear to have intended it as a *præcipuum* to the child, collation is excluded. A child is not bound to collate an heritable subject provided to him, because the legitime is not impaired by such provision As this collation takes place only in questions among children who are intitled to the legitime, the relict is not bound to collate donations given her by her husband, in order to increase the legitime; and on the other part, the children are not obliged to collate their provisions, in order to increase her share.

11. As an heir in heritage must compleat his titles by entry, so an executor is not vested in the right of the moveable estate of the deceased without confirmation. Confirmation is a sentence of the Commissary or Bishop's court, impowering an executor, one or more, upon making inventory of the moveables pertaining to the deceased, to recover, possess, and administer them, either in behalf of themselves, or of others interested therein. Testaments must be confirmed in the commissariot where the deceased had his principal dwelling house at his death. If he had no fixed residence, or died in a foreign country, the confirmation must be at *Edinburgh*, as the *commune forum*; but if he went abroad with an intention to return, the commissariot within which he resided, before he left Scotland, is the only proper court.

12. Confirmation proceeds upon an edict, which is affixed on the door of the parish-church where the deceased dwelt, and serves to intimate to all concerned the day of confirmation, which must be nine days at least after publishing the edict. In a competition for the office of executor, the Commissary prefers, *primo loco*, the person named to it by the deceased himself, whose nomination he ratifies or confirms, without any previous decerniture; this is called the confirmation of a testament-testamentary. In default of an executor named by the deceased, universal disponees are by the present practice preferred; after them, the next of kin; then the relict; then creditors; and lastly, special legatees All these must be decerned executors, by a sentence called a decree-dative; and if afterwards they incline to confirm, the Commissary authorises them to administer, upon their making inventory, and giving security to make the subject thereof forthcoming to all having interest; which is called the confirmation of a testament-dative.

13. A creditor, whose debtor's testament is already confirmed, may sue the executor, who holds the office for all concerned, to make payment of his debt. Where there is no confirmation, he himself may apply for the office, and confirm as executor creditor; which intitles him to sue for, and receive the subject confirmed, for his own payment: And where one applies for a confirmation, as executor-creditor, every co-creditor may apply to be conjoined with him in the office. As this kind of confirmation is simply a form of diligence, creditors are exempted from the necessity of confirming more than the amount of their debts.

14 A creditor, whose debt has not been constituted, or his claim not closed by decree, during the life of his debtor, has no title to demand directly the office of executor *qua* creditor; but he may charge the next of kin who stands off, to confirm, who must either renounce within twenty days after the charge, or be liable for the debt; and if the next of kin renounces, the pursuer may constitute his debt, and obtain a decree *cognitionis causa*, against the *hereditas jacens* of the moveables, upon which he may confirm as executor creditor to the deceased. Where one is creditor, not to the deceased. but to his next of kin who stands off from confirming, he may affect the moveables of the deceased, by obtaining himself decerned

decerned executor dative to the deceafed, as if he were creditor to him, and not to his next of kin.

15. Where an executor has either omitted to give up any of the effects belonging to the deceafed in inventory, or has eftimated them below their juft value, there is place for a new confirmation, *ad omiffa, vel male appretiata*, at the fuit of any having intereft; and if it appears that he has not omitted or undervalued any fubject *dolofé*, the Commiffary will ordain the fubjects omitted, or the difference between the eftimations in the principal teftament and the true values, to be added thereto; but if dole fhall be prefumed, the whole fubject of the teftament *ad omiffa vel male appretiata*, will be carried to him who confirms it, to the exclufion of the executor in the principal teftament.

16. The legitime and relict's fhare, becaufe they are rights arifing *ex lege*, operate *ipfo jure*, upon the father's death, in favour of the relict and children; and confequently pafs from them, though they fhould die before confirmation, to their next of kin: Whereas the dead's part, which falls to the children or other next of kin in the way of fucceffion, remains, if they fhould die before confirming, *in bonis* of the firft deceafed; and fo does not defcend to their next of kin, but may be confirmed by the perfon who, at the time of confirmation, is the next of kin to the firft deceafed. Special affignations, though neither intimated, nor made public, during the life of the granter, carry to the affigney the full right of the fubjects affigned, without confirmation. Special legacies are really affignations, and fo fall under this rule. The next of kin, by the bare poffeffion of the *ipfa corpora* of moveables, acquires the property thereof without confirmation, and tranfmits it to his executors.

17. The confirmation of any one fubject by the next of kin, as it proves his right of blood, has been adjudged to carry the whole executry out of the teftament of the deceafed, even what was omitted, and to tranfmit all to his own executors. The confirmation of a ftranger, who is executor nominated, as it is merely a truft for the next of kin, has the effect to eftablifh the right of the next of kin to the fubjects confirmed, in the fame manner as if himfelf had confirmed them.

18. Executry, though it carries a certain degree of reprefentation of the deceafed, is properly an office: Executors therefore are not fubjected to the debts due by the deceafed, beyond the value of the inventory; but, at the fame time, they are liable in diligence for making the inventory effectual to all having intereft. An executor-creditor who confirms more than his debt amounts to, is liable in diligence for what he confirms. Executors are not liable in intereft, even upon fuch bonds recovered by them as carried intereft to tbe deceafed, becaufe their office obliges them to retain the fums they have made effectual, in order to a diftribution thereof among all having intereft. This holds though they fhould again lend out the money upon intereft, as they do it at their own rifk.

19 There are certain debts of the deceafed called privileged debts, which were always preferable to every other. Under that name are comprehended, medicines furnifhed to the deceafed on death-bed, phyficians fees during that period, funeral charges, and the rent of his houfe, and his fervant's wages for the year or term current at his death. Thefe the executors are in fafety to pay on demand. All the other creditors, who either obtain themfelves confirmed, or who cite the executor already confirmed, within fix months after their debtor's death, are preferred, *pari paffu*, with thofe who have done more timely diligence; and therefore no executor can either retain for his own debt, or pay a teftamentary debt, fo as to exclude any creditor, who fhall ufe diligence within the fix months, from the benefit of the *pari paffu* preference; neither can a decree for payment of debt be obtained, in that period, againft an executor, becaufe, till that term be elapfed, it cannot be known how many creditors may be intitled to the fund in his hands. If no diligence be ufed within the fix months, the executor may retain for his own debt, and pay the refidue *primo venienti*. Such creditors of the deceafed as have ufed diligence within a year after their debtor's death, are preferable on the fubject of his teftament to the creditors of his next of kin.

20. The only paffive title in moveables is vitious intromiffion, which may be defined, an unwarrantable intermeddling with the moveable eftate of a perfon deceafed, without the order of law. This is not confined, as the paffive titles in heritage are, to the perfons interefted in the fucceffion, but ftrikes againft all intromitters whatever. Where an executor confirmed, intromits with more than he has confirmed, he incurs a paffive title, fraud being in the common cafe prefumed from his not giving up in inventory the full fubject intermeddled with. Vitious intromiffion is alfo prefumed, where the repofitories of a dying perfon are not fealed up, as foon as he becomes incapable of fenfe, by his neareft relations; or, if he dies in a houfe not his own, they muft be fealed by the mafter of fuch houfe, and the keys delivered to the Judge-ordinary, to be kept by him, for the benefit of all having intereft.

21. The paffive title of vitious intromiffion does not take place where there is any probable title or circumftance that takes off the prefumption of fraud. In confequence of this rule, neceffary intromiffion, or *cuftodiæ caufa*, by the wife or children, who only continue the poffeffion of the deceafed, in order to preferve his goods for the benefit of all concerned, infers no paffive title. And upon the fame principle, an intromitter, by confirming himfelf executor, and thereby fubjecting himfelf to account, before action be brought againft him on the paffive titles, purges the vitiofity of his prior intromiffion: And where the intromitter is one who is interefted in the fucceffion, *e. g.* next of kin, his confirmation, at any time within a year from the death of the deceafed, will exclude the paffive title, notwithftanding a prior citation. As this paffive title was intended only for the fecurity of creditors, it cannot be fued upon by legatees; and fince it arifes *ex delicto*, it cannot be pleaded againft the heir of the intromitter. As in delicts, any one of many delinquents may be fubjected to the whole punifhment, fo any one of many intromitters may be fued *in folidum* for the purfuer's debt, without calling the reft; but the intromitter who pays, has an action of relief againft the others for their fhare of it. If the intromitters are fued jointly,

jointly, they are liable, not *pro rata* of their ſeveral intromiſſions, but *pro virili.*

28. The whole of a debtor's eſtate is ſubjected to the payment of his debts; and therefore, both his heirs and executors are liable for them, in a queſtion with creditors; but as ſucceſſion is by law divided into the heritable and the moveable eſtate, each of theſe ought, in a queſtion between the ſeveral ſucceſſors, to bear the burdens which naturally affect it. Action of relief is accordingly competent to the heir who has paid a moveable debt, againſt the executor; and *vice verſa.* This relief is not cut off by the deceaſed's having diſponed either his land-eſtate or his moveables, with the burden of his *whole* debts; for ſuch burden is not to be conſtrued as an alteration of the legal ſucceſſion, but merely as a farther ſecurity to creditors, unleſs the contrary ſhall be preſumed from the ſpecial ſtyle of the diſpoſition.

Tit. 29. *Of laſt Heirs and Baſtards.*

By our ancient practice, feudal grants taken to the vaſſal, and to a ſpecial order of heirs, without ſettling the laſt termination upon *heirs whatſoever*, returned to the ſuperior, upon failure of the ſpecial heirs therein contained, but now that feus are become patrimonial rights, the ſuperior is, by the general opinion, held to be fully diveſted by ſuch grant, and the right deſcends to the vaſſal's heirs at law. And even where a vaſſal dies, without leaving any heir who can prove the remoteſt propinquity to him, it is not the ſuperior, as the old law ſtood, but the King, who ſucceeds as laſt heir, both in the heritable and moveable eſtate of the deceaſed, in conſequence of the rule, *Quod nullius eſt, cedit domino Regi.*

2. If the lands, to which the King ſucceeds, be holden immediately of himſelf, the property is conſolidated with the ſuperiority, as if reſignation had been made in the Sovereign's hands. If they are holden of a ſubject, the King, who cannot be vaſſal to his own ſubject, names a donatory; who, to complete his title, muſt obtain decree of declarator; and thereafter he is preſented to the ſuperior, by letters of preſentation from the King under the quarter-ſeal, in which the ſuperior is charged to enter the donatory. The whole eſtate of the deceaſed is, in this caſe, ſubjected to his debts, and to the widow's legal proviſions. Neither the King nor his donatory is liable beyond the value of the ſucceſſion. A perſon who has no heir to ſucceed to him, cannot alien his heritage *in lecto*, to the prejudice of the King, who is intitled to ſet aſide ſuch deed, in the character of *ultimus heres.*

3. A baſtard can have no legal heirs, except thoſe of his own body; ſince there is no ſucceſſion but by the father, and a baſtard has no certain father. The King therefore ſucceeds to him, failing his lawful iſſue, as laſt heir. Though the baſtard, as abſolute proprietor of his own eſtate, can diſpoſe of his heritage in *liege pouſtie*, and of his moveables by any deed *inter vivos;* yet he is diſabled, *ex defectu natalium*, from bequeathing by teſtament, without letters of legitimation from the Sovereign. If the baſtard has lawful children, he may teſt, without ſuch letters, and name tutors and curators to his iſſue. Letters of legitimation, let their clauſes be ever ſo ſtrong, cannot enable the baſtard to ſucceed to his natural father, to the excluſion of lawful heirs.

4. The legal rights of ſucceſſion, being founded in marriage, can be claimed only by thoſe who are born in lawful marriage; the iſſue therefore of an unlawful marriage are incapable of ſucceſſion. A baſtard is excluded, 1. From his father's ſucceſſion; becauſe law knows no father, who is not marked out by marriage. 2. From all heritable ſucceſſion, whether by the father or mother; becauſe he cannot be pronounced lawful heir by the inqueſt, in terms of the brief; and, 3. From the moveable ſucceſſion of his mother; for, though the mother be known, the baſtard is not her lawful child, and legitimacy is implied in all ſucceſſion conferred by law. A baſtard, though he cannot ſucceed *jure ſanguinis*, may ſucceed by deſtination, where he is ſpecially called to the ſucceſſion by an entail or teſtament.

5. Certain perſons, though born in lawful marriage, are incapable of ſucceſſion. Aliens are, from their allegiance to a foreign prince, incapable of ſucceeding in *feudal rights*, without naturalization. Children born in a foreign ſtate, whoſe fathers were natural born ſubjects, and not attainted, are held to be natural-born ſubjects. Perſons educated in, or profeſſing the Popiſh religon, if they ſhall neglect, upon their attaining the age of fifteen, to renounce its doctrines by a ſigned declaration, cannot ſucceed in *heritage*; but muſt give place to the next Proteſtant heir, who will hold the eſtate irredeemably, if the Popiſh heir does not, within ten years after incurring the irritancy, ſign the *formula* preſcribed by the ſtatute 1700, *c.* 3.

Tit. 30. *Of Actions.*

Hitherto of *perſons* and *rights*, the two firſt objects of law; *actions* are its third object, whereby perſons make their rights effectual. An action may be defined, a demand regularly made and inſiſted in, before the judge competent, for the attaining or recovering of a right; and it ſuffers ſeveral diviſions, according to the different natures of the rights purſued upon.

2. Actions are either real or perſonal. A real action, is that which ariſes from a right in the thing itſelf, and which therefore may be directed againſt all poſſeſſors of that thing: Thus, an action for the recovery, even of a moveable ſubject, when founded on a *jus in re*, is in the proper acceptation real; but real actions are, in vulgar ſpeech, confined to ſuch as are directed againſt heritable ſubjects. A perſonal action is founded only on an obligation undertaken for the performance of ſome fact, or the delivery of ſome ſubject; and therefore can be carried on againſt no other than the perſon obliged, or his heirs.

3 Actions are either ordinary or reſciſſory. All actions are, in the ſenſe of this diviſion, ordinary, which are not reſciſſory. Reſciſſory actions are divided, 1. Into actions of proper improbation. 2. Actions of reduction-improbation. 3. Actions of ſimple reduction. Proper improbations, which are brought for declaring writings falſe or forged, are treated of below, Tit. 33.

Reduction-

Reduction-improbation is an action, whereby a perfon who may be hurt or affected by a writing, infifts for producing or exhibiting it in court, in order to have it fet afide, or its effect afcertained, under the certification that the writing, if not produced, fhall be declared falfe and forged. This certification is a fiction of law, introduced that the production of writings may be the more effectually forced, and therefore it operates only in favour of the purfuer. Becaufe the fummons in this action proceeds on alledged grounds of falfehood, his Majefty's Advocate, who is the public profecutor of crimes, muft concur in it.

4. As the certification in this procefs draws after it fo heavy confequences, two terms are affigned to the defenders for production. After the fecond term is elapfed, intimation muft be made judicially to the defender, to fatisfy the production within ten days; and till thefe are expired, no certification can be pronounced. Certification cannot pafs againft deeds recorded in the books of Seffion, if the defender fhall, before the fecond term, offer a condefcendence of the dates of their regiftration, unlefs falfehood be objected; in which cafe, the original muft be brought from the record to the court. But an extract from the inferior court is no bar to certification; the principal writing muft be laid before the court of Seffion on a proper warrant.

5. In an action of fimple reduction the certification is only temporary, declaring the writings called for, null, until they be produced; fo that they recover their full force after production, even againft the purfuer himfelf; for which reafon, that procefs is now feldom ufed. Becaufe its certification is not fo fevere as in reduction-improbation, there is but on term affigned to the defender for producing the deeds called for.

6. The moft ufual grounds of reductions of writings are, the want of the requifite folemnities; that the granter was minor, or interdicted, or inhibited; or that he figned the deed on death-bed, or was compelled or frightened into it, or was circumvented; or that he granted it in prejudice of his lawful creditors.

7. In reductions on the head of force, or fear, or fraud and circumvention, the purfuer muft libel the particular circumftances from which his allegation is to be proved. Reduction is not competent upon every degree of force or fear; it muft be fuch as would fhake a man of conftancy and refolution. Neither is it competent, on that fear which arifes from the juft authority of hufbands or parents over their wives or children, nor upon the fear arifing from the regular execution of lawful diligence by caption, provided the deeds granted under that fear relate to the ground of debt contained in the diligence; but if they have no relation to that debt, they are reducible *ex metu*.

8. Alienations granted by debtors after contracting of lawful debts, in favour of conjunct or confident perfons, without juft and neceffary caufes, and without a juft price really paid, are null. One is deemed a prior creditor, whofe ground of debt exifted before the right granted by the debtor; though the written voucher of the debt fhould bear a date pofterior to it. Perfons are accounted conjunct, whofe relation to the granter is fo near, as to bar them from judging in his caufe. Confident perfons are thofe who appear to be in the granter's confidence, by being employed in his affairs, or about his perfon; as a doer, fteward, or domeftic fervant.

9. Rights, though gratuitous, are not reducible, if the granter had, at the date thereof, a fufficient fund for the payment of his creditors. Provifions to children are, in the judgment of law, gratuitous; fo that their effect, in a queftion with creditors, depends on the folvency of the granter: But fettlements to wives, either in marriage contracts, or even after marriage, are onerous, in fo far as they are rational; and confequently are not reducible, even though the granter was infolvent. This rule holds alfo in rational tochers contracted to hufbands: But it muft, in all cafes, be qualified with this limitation, *if the infolvency of the granter was not publicly known*; for if it was, fraud is prefumed in the receiver of the right, by contracting with the bankrupt.

10. The receiver of the deed, if he be a conjunct or confident perfon, muft aftruct or fupport the onerous caufe of his right, not merely by his own oath, but by fome circumftances or adminicles. But where a right is granted to a ftranger, the narrative of it expreffing an onerous caufe, is fufficient *per fe* to fecure it againft reduction.

11. All voluntary payments or rights made by a bankrupt to one creditor, to difappoint the more timeous diligence of another, are reducible at the inftance of that creditor who has ufed the prior diligence. A creditor, though his diligence be but begun by citation, may infift in a reduction of all pofterior voluntary rights granted to his prejudice; but the creditor who neglects to complete his begun diligence within a reafonable time, is not intitled to reduce any right granted by the debtor, after the time that the diligence is confidered as abandoned.

12. A prohibited alienation, when conveyed by the receiver to another who is not privy to the fraud, fubfifts in the perfon of the *bona fide* purchafer. In the cafe of moveable rights, this nullity is receivable by exception; but it muft be declared by reduction, where the right is heritable.

13. By act 1696, *c.* 5. all alienations by a bankrupt, within fixty days before his bankruptcy, to one creditor in preference to another, are reducible, at the inftance even of fuch co-creditors as had not ufed the leaft ftep of diligence. A bankrupt is there defcribed by the following characters; diligence ufed againft him by horning and caption; and infolvency, joined either with imprifonment, retiring to the fanctuary, abfconding, or forcibly defending himfelf from diligence. It is fufficient that a caption is raifed againft the debtor, though it be not executed, provided he has retired to fhun it. It is provided, that all heritable bonds or rights on which feifin may follow, fhall be reckoned, in a queftion with the granter's other creditors upon this act, to be of the date of the feifin following thereon. But this act was found to relate only to fecurities for former debts, and not to *nova debita*.

14. Actions are divided into *rei perfecutoriæ*, and *pœnales*. By the firft, the purfuer infifts barely to recover the fubject that is his, or the debt due to him; and this includes

includes the damage suſtained; for one is as truly a sufferer in his patrimonial intereſt by that damage, as by the loſs of the ſubject itſelf. In penal actions, which always ariſe *ex delicto*, ſomething is alſo demanded by way of penalty.

15. Actions of ſpuilzie, ejection, and intruſion, are penal. An action of ſpuilzie is competent to one diſpoſſeſſed of a moveable ſubject violently, or without order of law, againſt the perſon diſpoſſeſſing; not only for being reſtored to the poſſeſſion of the ſubject, if extant, or for the value, if it be deſtroyed, but alſo for the violent profits, in caſe the action be brought within three years from the ſpoliation. Ejection and intruſion are, in heritable ſubjects, what ſpuilzie is in moveables. The difference between the two firſt is, that in ejection, violence is uſed; whereas the intruder enters into the void poſſeſſion, without either a title from the proprietor, or the warrant of a judge. The actions ariſing from all the three are of the ſame general nature.

16. The action of contravention of law-borrows is alſo penal. It proceeds on letters of law-borrows, (from *borgh* a cautioner), which contain a warrant to charge the party complained upon, that he may give ſecurity, not to hurt the complainer in his perſon, family, or eſtate. Theſe letters do not require the previous citation of the party complained upon, becauſe the caution which the law requires is only for doing what is every man's duty; but, before the letters are executed againſt him, the complainer muſt make oath that he dreads bodily harm from him. The penalty of contravention is aſcertained to a ſpecial ſum, according to the offender's quality; the half to be applied to the fiſk, and the half to the complainer. Contravention is not incurred by the uttering of reproachful words, where they are not accompanied, either with acts of violence, or at leaſt a real injury; and as the action is penal, it is elided by any probable ground of excuſe.

17 Penalties are the conſequences of delict, or tranſgreſſion; and as no heir ought to be accountable for the delict of his anceſtor, farther than the injured perſon has really ſuffered by it, penal actions die with the delinquent, and are not tranſmiſſible againſt heirs. Yet the action, if it has been commenced, and litiſconteſted in the delinquent's lifetime, may be continued againſt the heir, though the delinquent ſhould die during the dependence. Some actions are *rei perſecutoriæ* on the part of the purſuer, when he inſiſts for ſimple reſtitution; which yet may be penal in reſpect of the defender; *e. g.* the action on the paſſive title of vitious intromiſſion, by which the purſuer frequently recovers the debt due to him by the deceaſed, though it ſhould exceed the value of the goods intermeddled with by the defenders.

18. The moſt celebrated diviſion of actions in our law, is into *petitory*, *poſſeſſory*, and *declaratory*. *Petitory* actions are thoſe, where ſomething is demanded from the defender, in conſequence of a right of property, or of credit in the purſuer: Thus, actions for reſtitution of moveables, actions of poinding, of forthcoming, and indeed all perſonal actions upon contracts or quaſi-contracts, are petitory. *Poſſeſſory* actions are thoſe which are founded, either upon poſſeſſion alone, as ſpuilzies; or upon poſſeſſion joined with another title, as removings; and they are competent either for getting into poſſeſſion, for holding it, or for recovering it; analogous to the interdicts of the Roman law, *quorum bonorum*, *uti poſſidetis*, and *unde vi*.

16. An action of moleſtation is a poſſeſſory action, competent to the proprietor of a land-eſtate, againſt thoſe who diſturb his poſſeſſion. It is chiefly uſed in queſtions of commonty, or of controverted marches. Where a declarator of property is conjoined with a proceſs of moleſtation, the ſeſſion alone is competent to the action. Actions on brieves of perambulation, have the ſame tendency with moleſtations, *viz.* the ſettling of marches between conterminous lands.

20 The action of mails and duties is ſometimes petitory, and ſometimes poſſeſſory. In either caſe, it is directed againſt the tenants and natural poſſeſſors of land-eſtates, for payment to the purſuer of the rents remaining due by them for paſt crops, and of the full rent for the future. It is competent, not only to a proprietor whoſe right is perfected by ſeiſin, but to a ſimple diſponee, for a diſpoſition of lands includes a right to the mails and duties; and conſequently to an adjudger, for an adjudication is a judicial diſpoſition. In the petitory action, the purſuer, ſince he founds upon right, not poſſeſſion, muſt make the proprietor, from whom the tenants derive their right, party to the ſuit; and he muſt ſupport his claim by titles of property or diligences, preferable to thoſe in the perſon of his competitor. In the poſſeſſory, the purſuer, who libels that he, his anceſtors or authors, have been ſeven years in poſſeſſion, and that therefore he has the benefit of a poſſeſſory judgment, need produce no other title than a ſeiſin, which is a title ſufficient to make the poſſeſſion of heritage lawful; and it is enough, if he calls the natural poſſeſſors, though he ſhould neglect the proprietor. A poſſeſſory judgment founded on ſeven years poſſeſſion, in conſequence either of a ſeiſin or a tack, has this effect, that though one ſhould claim under a title preferable to that of the poſſeſſor, he cannot compete with him in the poſſeſſion, till in a formal proceſs of reduction he ſhall obtain the poſſeſſor's title declared void.

21. A *declaratory* action is that, in which ſome right is craved to be declared in favour of the purſuer, but nothing ſought to be paid or performed by the defender, ſuch as declarators of marriage, of irritancy, of expiry of the legal reverſion, *&c.* Under this claſs may be alſo comprehended reſciſſory actions, which, without any perſonal concluſion againſt the defender, tend ſimply to ſet aſide the rights or writings libelled, in conſequence of which a contrary right or immunity ariſes to the purſuer. Decrees upon action that are properly declaratory confer no new right; they only declare what was the purſuer's right before, and ſo have a retroſpect to the period at which that right firſt commenced. Declarators, becauſe they have no perſonal concluſion againſt the defender, may be purſued againſt an apparent heir without a previous charge given him to enter to his anceſtor; unleſs where ſpecial circumſtances require a charge.

22. An action for proving the tenor, whereby a writing, which is deſtroyed or amiſſing, is endeaved to be revived, is in effect declaratory. In obligations that are extinguiſhable

extinguishable barely by the debtor's retiring or cancelling them, the pursuer, before a proof of the tenor is admitted, must condescend on such a *casus amissionis*, or accident by which the writing was destroyed, as shews it was lost when in the creditor's possession; otherwise bonds that have been cancelled by the debtor on payment, might be reared up as still subsisting against him: But in writings which require contrary deeds to extinguish their effect, as assignations, dispositions, charters, *&c.* it is sufficient to libel that they were lost, even *casu fortuito*.

23. Regularly, no deed can be revived by this action, without some adminicle in writing, referring to that which is libelled; for no written obligation ought to be raised up barely on the testimony of witnesses. If these adminicles afford sufficient conviction, that the deed libelled did once exist, the tenor is admitted to be proved by witnesses, who must depose, either that they were present at signing the deed, or that they afterwards saw it duly subscribed. Where the relative writings contain all the substantial clauses of that which is lost, the tenor is sometimes sustained without witnsses. In a writing which is libelled to have contained uncommon clauses, all these must appear by the adminicles. Actions of proving the tenor are, on account of their importance, appropriated to the court of Session; and, by the old form, the testimony of the witnesses could not be received, but in presence of all the judges.

24. The action of double or multiple poinding may be also reckoned declaratory. It is competent to a debtor, who is distressed, or threatened with distress, by two or more persons claiming right to the debt, and who therefore brings the several claimants into the field, in order to debate and settle their several preferences, that so he may pay securely to him whose right shall be found preferable. This action is daily pursued by an arrestee, in the case of several arrestments used in his hands for the same debt; or by tenants in the case of several adjudgers, all of whom claim right to the same rents. In these competitions, any of the competitors may bring an action of multiple-poinding in name of the tenants, or other debtors, without their consent, or even though they should disclaim the process; since the law has introduced it as the proper remedy for getting such competitions determined: And while the subject in controversy continues *in medio*, any third person who conceives he has a right to it, may, though he should not be cited as a defender, produce his titles, as if he were an original party to the suit, and will be admitted for his interest in the competition.

25. Certain actions may be called accessory, because they are merely preparatory or subservient to other actions. Thus, exhibitions *ad deliberandum*, at the instance of an heir against the creditors or custodiers of his ancestor's writings, are intended only to pave the way for future processes. An action of transference is also of this sort, whereby an action, during the pendency of which the defender happens to die, is craved to be transferred against his representative, in the same condition in which it stood formerly. Upon the pursuer's death, his heir may insist in the cause against the defender, upon producing, either a retour or a confirmed testament, according as the subject is heritable or moveable. Transferences being but incidental to other actions, can be pronounced by that inferior judge alone before whom the principal cause depended; but where the representatives of the deceased live in another territory, it is the supreme court which must transfer. Obligations may be now registred summarily after the creditor's death; which before was not admitted, without a separate process of registration, to which the granter was necessarily to be made a party.

26. A process of wakening is likewise accessory. An action is said to sleep, when it lies over, not insisted in for a year, in which case its effect is suspended; but even then it may, at any time within the years of prescription, be revived or wakened by a summons, in which the pursuer recites the last step of the process, and concludes that it may be again carried on as if it had not been discontinued. An action that stands upon any of the inner-house rolls cannot sleep; nor an action in which decree is pronounced, because it has got its full completion: Consequently the decree may be extracted after the year, without the necessity of a wakening.

27. An action of transumpt falls under the same class. It is competent to those, who have a partial interest in writings that are not in their own custody, against the possessors thereof, for exhibiting them, that they may be transumed for their behoof. Though the ordinary title in this process be an obligation by the defender to grant transumpts to the pursuer, it is sufficient if the pursuer can show that he has an interest in the writings; but, in this case, he must transume them on his own charges. Actions of transumpt may be pursued before any judge-ordinary. After the writings to be transumed are exhibited, full duplicates are made out, collated, and signed, by one of the clerks of court, which are called transumpts, and are as effectual as an extract from the register.

28. Actions proceeded anciently upon brieves issuing from the chancery, directed to the justiciary or judge-ordinary, who tried the matter by a jury, upon whose verdict judgment was pronounced: And to this day, we retain certain brieves, as of *inquest*, *terce*, *ideotry*, *tutory*, *perambulation*, and perhaps two or three others: But summonses were, immediately upon the institution of the College of Justice, introduced in the place of brieves. A summons, when applied to actions pursued before the session, is a writ in the King's name, issuing from his signet upon the pursuer's complaint, authorising messengers to cite the defender to appear before the court, and make his defences; with certification if he fail to appear, that decree will be pronounced against him in terms of the certification of the summons.

29. The days indulged by law to a defender, between his citation and appearance, to prepare for his defence, are called *induciæ legales*. If he is within the kingdom, twenty one and six days, for the first and second diets of appearance, must be allowed him for that purpose; and if out of it, sixty and fifteen. Defenders residing in Orkney or Zetland must be cited on forty days. In certain summonses which are priviledged, the *induciæ* are shortened: Spuilzies and ejections proceed on fifteen days;

wakenings

wakenings and transferences, being but incidental, on fix; fee the lift of privileged fummonfes, in act of federunt June 29. 1672. A fummons muft be executed, *i. e.* ferved againft the defender, fo as the laft diet of appearance may be within a year after the date of the fummons; and it muft be called within a year after that diet, otherwife it falls for ever. Offence againft the authority of the court, acts of malverfation in office by any member of the college of juftice, and acts of violence and oppreffion committed during the dependence of a fuit by any of the parties, may be tried without a fummons, by a fummary complaint.

30 Where an action is in part penal, *e. g.* a removing fpuilzie, *&c.* a purfuer who reftricts his demand to, and obtains decree merely for reftitution, cannot thereafter bring a new procefs for the violent profits. Yet the fame fact may be the foundation both of a criminal and civil action, becaufe thefe two are intended for different purpofes; the one for fatisfying the public juftice, the other for indemnifying the private party: And though the defender fhould be abfolved in the criminal trial, for want of evidence, the party injured may bring an action *ad civilem effectum*, in which he is intitled to refer the libel to the defender's oath.

31. One libel or fummons may contain different conclufions on the fame ground of right, refciffory, declaratory, petitory, *&c.* if they be not repugnant to each other: Nay, though different fums be due to one, upon diftinct grounds of debt, or even by different debtors, the creditor may infift againft them all in the fame fummons.

32. Defences are pleas offered by a defender for eliding an action. They are either dilatory, which do not enter into the caufe itfelf, and fo can only procure an abfolviture from the *lis pendens:* Or peremptory, which entirely cut off the purfuer's right of action. The firft, becaufe they relate to the forms of proceeding, muft be offered *in limine judicii*, and all of them at once. But peremptory defences may be proponed at any time before fentence.

33. A caufe, after the parties had litigated it before the judge, was faid by the Romans to be litifcontefted. By litifconteftation a judicial contract is underftood to be entered into by the litigants, by which the action is perpetuated againft heirs, even when it arifes *ex delicto*. By our law, litifconteftation is not formed till an act is extracted, admitting the libel or defences to proof.

Tit. 31. *Of Probation.*

All allegations by parties to a fuit, muft be fupported by proper proof. Probation is either by writing, by the party's own oath, or by witneffes. In the cafe of allegations, which may be proved by either of the three ways, a proof is faid to be admitted *prout de jure;* becaufe, in fuch cafe, all the legal methods of probation are competent to the party: If the proof he brings by writing be lame, he may have recourfe either to witneffes or to his adverfary's oath; but, if he fhould firft take himfelf to the proof by oath, he cannot thereafter ufe any other probation, for the reafon affigned § 3. and, on the contrary, a purfuer, who has brought a proof by witneffes, on an extracted act, is not allowed to recur to the oath of the defender. Single combat, as a fort of appeal to Providence, was, by our ancient law, admitted as evidence, in matters both civil and criminal. It was afterwards reftricted to the cafe of fuch capital crimes where no other proof could be had; fome traces of this blind method of trial remained even in the reign of *J.* VI. who, by 1600. *c.* 12. might authorife duels on weighty occafions.

2. As obligations or deeds figned by the party himfelf, or his anceftors or authors, muft be, of all evidence, the leaft liable to exception; therefore every debt or allegation may be proved by proper evidence in writing. The folemnities effential to probative deeds have been already explained, Tit. xxi. 3. *et feq.* Books of account kept by merchants, tradefmen, and other dealers in bufinefs, though not fubfcribed, are probative againft him who keeps them; and, in cafe of furnifhings by a fhop-keeper, fuch books, if they are regularly kept by him, fupported by the teftimony of a fingle witnefs, afford a *femiplena probatio* in his favour, which becomes full evidence by his own oath in fupplement. Notorial inftruments and executions by meffengers bear full evidence, that the folemnities therein fet forth were ufed, not to be invalidated otherwife than by a proof of falfehood; but they do not prove any other extrinfic facts therein averred, againft third parties.

3. Regularly, no perfon's right can be proved by his own oath, nor taken away by that of his adverfary; becaufe thefe are the bare averments of parties in their own favour. But, where the matter in iffue is referred by one of the parties to the oath of the other, fuch oath, though made in favour of the deponent himfelf, is decifive of the point; becaufe the reference is a virtual contract between the litigants, by which they are underftood to put the iffue of the caufe upon what fhall be depofed: And this contract is fo ftrictly regarded, that the the party who refers to the oath of the other cannot afterwards, in a civil action, plead upon any deed againft the party depofing, inconfiftent with his oath. To obviate the fnares that may be laid for perjury, he, to whofe oath of verity a point is referred, may refufe to depofe, till his adverfary fwear that he can bring no other evidence in proof of his allegation.

4. A defender, though he cannot be compelled to fwear to facts in a libel properly criminal; yet may, in trefpaffes, where the conclufion is limited to a fine, or to damages. In general, an oath of party cannot either hurt or benefit third parties; being, as to them, *res inter alios acta.*

5. An oath upon reference, is fometimes qualified by fpecial limitations reftricting it. The qualities which are admitted by the judge as part of the oath, are called intrinfic; thofe which the judge rejects or feparates from the oath, extrinfic. Where the quality makes a part of the allegation which is relevantly referred to oath, it is intrinfic. Thus, becaufe a merchant, fuing for furnifhings after the three years, muft, in order to make a relevancy, offer to prove by the defender's oath, not only the delivery of the goods, but that the price is ftill due; there-

fore, though the defender ſhould acknowledge upon oath his having received the goods, yet, if he adds, that he paid the price, this laſt part, being a denial that the debt ſubſiſts, is intrinſic, ſince it is truly the point referred to oath. Where the quality does not import an extinction of the debt, but barely a counter-claim, or *mutua petitio*, againſt the purſuer, it is held as extrinſic, and muſt be proved *aliunde*. Neither can a defender who in his oath admits the conſtitution of a debt, get off by adjecting the quality of payment, where the payment ought by its nature to be vouched by written evidence.

6. Oaths of verity are ſometimes deferred by the judge to either party, *ex officio*; which becauſe they are not founded on any implied contract between the litigants, are not finally deciſive, but may be traverſed on proper evidence afterwards produced. Theſe oaths are commonly put by the judge for ſupplying a lame or imperfect proof, and are therefore called oaths in ſupplement. See § 2.

7. To prevent groundleſs allegations, oaths of calumny have been introduced, by which either party may demand his adverſary's oath, that he believes the fact contained in his libel or defences to be juſt and true. As this is an oath, not of verity, but only of opinion, the party who puts it to his adverſary, does not renounce other probation; and therefore no party is bound to give an oath of calumny, on recent facts of his own, for ſuch oath is really an oath of verity. Theſe oaths have not been ſo frequent ſince the act of ſederunt, Feb. 1. 1715, whereby any party, againſt whom a fact ſhall be alledged, is obliged, without making oath, to confeſs or deny it; and in caſe of calumnious denial, is ſubjected to the expence that the other party has thereby incurred.

8. In all oaths, whether of verity or calumny, the citation carries, or at leaſt implies, a certification, that if the party does not appear at the day aſſigned for depoſing, he ſhall be held *pro confeſſo*; from a preſumption of his conſciouſneſs, that the fact upon which he declines to ſwear makes againſt him; but no party can be held *pro confeſſo*, if he be in the kingdom, without a previous perſonal citation uſed againſt him. Though an oath which reſolves into a *non memini*, cannot be ſaid to prove any point; yet where one ſo depoſes upon a recent fact, to which he himſelf was privy, his oath is conſidered as a diſſembling of the truth, and he is held *pro confeſſo*, as if he had refuſed to ſwear.

9. An oath *in litem*, is that which the judge defers to a purſuer, for aſcertaining either the quantity or the value of goods which have been taken from him by the defender without order of law, or the extent of his damages. An oath *in litem*, as it is the affirmation of a party in his own behalf, is only allowed where there is proof that the other party has been engaged in ſome illegal act, or where the public policy has made it neceſſary, ſee Tit. xx. 11. This oath, as to the quantities, is not admitted, where there is a concurring teſtimony of witneſſes brought in proof of it. When it is put as to the value of goods, it is only an oath of credulity; and therefore it has always been ſubject to the modification of the court.

10. The law of Scotland rejects the teſtimony of witneſſes, 1. In payment of any ſum above *L.* 100 *Scots*, all which muſt be proved either *ſcripto vel juramento*. 2. In all gratuitous promiſes, though for the ſmalleſt trifle. 3. In all contracts, where writing is either eſſential to their conſtitution, (ſee Tit. xxi. 2) or where it is uſually adhibited, as in the borrowing of money. And it is a general rule, ſubject to the reſtrictions mentioned in the next §, that no debt or right, once conſtituted by writing, can be taken away by witneſſes.

11. On the other part, probation by witneſſes is admitted to the extent of *L.* 100 *Scots*, in payments, nuncupative legacies, and verbal agreements which contain mutual obligations. And it is received to the higheſt extent, 1. In all bargains which have known engagements naturally ariſing from them, concerning moveable goods. 2 In facts performed in ſatisfaction, even of a written obligation, where ſuch obligation binds the party preciſely to the performance of them. 3. In facts which with difficulty admit of a proof by writing, even though the effect of ſuch proof ſhould be the extinction of a written obligation, eſpecially if the facts import fraud or violence; thus, a bond is reducible *ex dolo*, on a proof by witneſſes. Laſtly, all intromiſſion by a creditor with the rents of his debtor's eſtate payable in grain, may be proved by witneſſes; and even intromiſſion with the ſilver-rent, where the creditor has entered into the total poſſeſſion of the debtor's lands.

12. No perſon, whoſe near relation to another bars him from being a judge in his cauſe, can be admitted as a witneſs for him; but he may, againſt him, except a wife or child, who cannot be compelled to give teſtimony againſt the huſband or parent, *ob reverentiam perſonæ, et metum perjurii*. Though the witneſs, whoſe propinquity to one of the parties is objected to, be as nearly related to the other, the objection ſtands good.

13. The teſtimony of infamous perſons is rejected, *i. e.* perſons who have been guilty of crimes that law declares to infer infamy, or who have been declared infamous by the ſentence of a judge; but *infamia facti* does not diſqualify a witneſs. Pupils are inhabile witneſſes; being, in the judgment of law, incapable of the impreſſions of an oath. The teſtimony of women is ſeldom admitted, where other witneſſes can be had. And in general witneſſes otherwiſe exceptionable may, where there is a penury of witneſſes ariſing from the nature or circumſtances of the fact, be received *cum nota*; that is, their teſtimony, though not quite free from ſuſpicion, is to be conjoined with the other evidence, and to have ſuch weight given it as the judge ſhall think it deſerves.

14. All witneſſes, before they are examined in the cauſe, are purged of partial counſel; that is, they muſt declare, that they have no intereſt in the ſuit, nor have given advice how to conduct it; that they have got neither bribe nor promiſe, nor have been inſtructed how to depoſe; and that they bear no enmity to either of the parties. Theſe, becauſe they are the points put to a witneſs before his making oath, are called *initialia teſtimonii*. Where a party can bring preſent proof of a witneſs's partial counſel, in any of the above particulars, he ought to offer it before the witneſs be ſworn; but, becauſe ſuch objection, if it cannot be inſtantly verified, will be no bar to the examination, law allows the party in that caſe to proteſt

protest for *reprobator*, before the witness is examined; *i. e.* that he may be afterwards allowed to bring evidence of his enmity, or other inhability. Reprobator is competent even after sentence, where protestation is duly entered; but in that case, the party insisting must consign *L.* 100 *Scots*, which he forfeits if he succumb. This action must have the concurrence of the King's Advocate, because the conclusion of it imports perjury; and for this reason, the witness must be made a party to it.

15. The interlocutory sentence or warrant, by which parties are authorised to bring their proof, is either by way of act, or of incident diligence. In an act, the Lord Ordinary who pronounces it, is no longer judge in the process; but in an incident diligence, which is commonly granted upon special points, that do not exhaust the cause, the Lord ordinary continues judge. If a witness does not appear at the day fixed by the warrant of citation, a second warrant is granted of the nature of a caption, containing a command to messengers to apprehend and bring him before the court. Where the party to whom a proof is granted, brings none within the term allowed by the warrant, an interlocutor is pronounced, circumducing the term, and precluding him from bringing evidence thereafter. Where evidence is brought, if it be upon an act, the Lord Ordinary on the acts, after the term for proving is elapsed declares the proof concluded, and thereupon a state of the case is prepared by the Ordinary on concluded causes, which must be judged by the whole Lords; but if the proof be taken upon an incident diligence, the import of it may be determined by the Lord Ordinary in the cause.

16. Where facts do not admit a direct proof, presumptions are received as evidence which, in many cases, make as convincing a proof as the direct. Presumptions are consequences deduced from facts known or proved, which infer the certainty, or at least a strong probability, of another fact to be proved. This kind of probation is therefore called artificial because it requires a reasoning to infer the truth of the point in question, from the facts that already appear in proof. Presumptions are either, 1. *juris et de jure*; 2. *juris*; or 3. *hominis* or *judicis*. The first sort obtains, where statute or custom establishes the truth of any point upon a presumption; and it is so strong, that it rejects all proof that may be brought to elide it in special cases. Thus, the testimony of a witness, who forwardly offers himself without being cited, is, from a presumption of his partiality, rejected, let his character be ever so fair; and thus also, a minor, because he is by law presumed incapable of conducting his own affairs, is, upon that presumption, disabled from acting without the consent of his curators, though he should be known to behave with the greatest prudence. Many such presumptions are fixed by statute.

17 *Præsumptiones juris* are those, which our law books or decisions have established, without founding any particular consequence upon them, or statuting *super præsumpto*. Most of this kind are not proper presumptions inferred from positive facts, but are founded merely on the want of a contrary proof; thus, the legal presumptions for freedom, for life, for innocence, *&c* are in effect so many negative propositions, that servitude, death, and guilt, are not to be presumed, without evidence brought by him who makes the allegation. All of them, whether they be of this sort, or proper presumptions, as they are only conjectures formed from what commonly happens, may be elided, not only by direct evidence, but by other conjectures, affording a stronger degree of probability to the contrary. *Præsumptiones hominis* or *judicis*, are those which arise daily from the circumstances of particular cases; the strength of which is to be weighed by the judge.

18. A *fictio juris* differs from a presumption. Things are presumed, which are likely to be true; but a fiction or law assumes for truth what is either certainly false, or, at least, is as probably false as true. Thus, an heir is feigned or considered in law as the same person with his ancestor. Fictions of law must, in their effects, be always limited to the special purposes of equity, for which they were introduced; see an example, Tit. xxx. 3.

Tit. 32. *Of Sentences and their Execution.*

Property would be most uncertain, if debateable points might, after receiving a definitive judgment, be brought again in question, at the pleasure of either of the parties: Every state has therefore affixed the character of final to certain sentences or decrees, which in the Roman law are called *res judicatæ*, and which exclude all review or rehearing

2. Decrees of the court of Session, are either *in foro contradictorio*, where both parties have litigated the cause, or in absence of the defender. Decrees of the Session *in foro* cannot, in the general case, be again brought under the review of the court, either on points which the parties neglected to plead before sentence (which we call competent and omitted), or upon points pleaded and found insufficient (proponed and repelled.) But decrees, though *in foro*, are reversible by the court, where either they labour under essential nullities; *e g.* where they are *ultra petita*, or not conformable to their grounds and warrants, or founded on an error in calcul, *&c.*; or where the party against whom the decree is obtained has thereafter recovered evidence sufficient to overturn it, of which he knew not before.

3. As parties might formerly reclaim against the sentences of the session, at any time before extracting the decree, no judgment was final till extract; but now, a sentence of the inner-house, either not reclaimed against within six federunt-days after its date, or adhered to upon a reclaiming bill, though it cannot receive execution till extract, makes the judgment final as to the court of Session. And, by an order of the house of Lords, March 24. 1725, no appeal is to be received by them from sentences of the Session after five years from extracting the sentence; unless the person entitled to such appeal be minor, clothed with a husband, *non compos mentis*, imprisoned, or out of the kingdom. Sentences pronounced by the Lord Ordinary have the same effect, if not reclaimed against, as if they were pronounced in presence; and all petitions against the interlocutor of an Ordinary must be preferred within eight federunt-days after signing such interlocutor.

4. De-

4. Decrees, in abfence of the defender, have not the force of *res judicatæ* as to him; for where the defender does not appear, he cannot be faid to have fubjected himfelf by the judicial contract which is implied in litifconteftation: A party therefore may be reftored againft thefe, upon paying to the other his cofts in recovering them. The fentences of inferior courts may be reviewed by the court of Seffion, before decree, by advocation, and after decree, by fufpenfion or reduction; which two laft are alfo the methods of calling in queftion fuch decrees of the Seffion itfelf as can again be brought under the review of the court.

5. Reduction is the proper remedy, either where the decree has already received full execution by payment, or where it decrees nothing to be paid or performed, but fimply declares a right in favour of the purfuer. Sufpenfion is that form of law by which the effect of a fentence condemnatory, that has not yet received execution, is ftayed or poftponed, till the caufe be again confidered. The firft ftep towards fufpenfion is a bill preferred to the Lord Ordinary on the bills. This bill, when the defire of it is granted, is a warrant for iffuing letters of fufpenfion which pafs the fignet; but, if the prefenter of the bill fhall not, within fourteen days after paffing it, expedite the letters, execution may proceed on the fentence. Sufpenfions of decrees *in foro* cannot pafs, but by the whole Lords in time of feffion, and by three in vacation time: but other decrees may be fufpended by any one of the judges.

6. As fufpenfion has the effect of ftaying the execution of the creditor's legal diligence, it cannot, in the general cafe, pafs without caution given by the fufpender to pay the debt, in the event it fhall be found due. Where the fufpender cannot, from his low or fufpected circumftances, procure unqueftionable fecurity, the Lords admit juratory caution, *i. e.* fuch as the fufpender fwears is the beft he can offer; but the reafons of fufpenfion are, in that cafe, to be confidered with particular accuracy at paffing the bill. Decrees in favour of the clergy, of univerfities, hofpitals, or parifh fchool mafters, for their ftipends, rents, or falaries, cannot be fufpended, but upon production of difcharges, or on configuration of the fums charged for. A charger, who thinks himfelf fecure without a cautioner, and wants difpatch, may, where a fufpenfion of his diligence is fought, apply to the court to get the reafons of fufpenfion fummarily difcuffed on the bill.

7. Though he, in whofe favour the decree fufpended is pronounced, be always called the charger, yet a decree may be fufpended before a charge be given on it. Nay, fufpenfion is competent even where there is no decree, for putting a ftop to any illegal act whatfoever: Thus, a building, or the exercife of a power which one affumes unwarrantably, is a proper fubject of fufpenfion. Letters of fufpenfion are confidered merely as a prohibitory diligence; fo that the fufpender, if he would turn provoker, muft bring an action of reduction. If upon difcuffing the letters of fufpenfion, the reafons fhall be fuftained, a decree is pronounced, fufpending the letters of diligence on which the charge was given *fimpliciter*; which is called a decree of fufpenfion, and takes off the effect of the decree fufpended. If the reafons of fufpenfion be repelled, the court find the letters of diligence orderly proceeded, *i. e.* regularly carried on; and they ordain them to be put to farther execution.

8. Decrees are carried into execution, by diligence, either againft the perfon, or againft the eftate of the debtor. The firft ftep of perfonal execution is by letters of horning, which pafs, by warrant of the court of Seffion, on the decrees of magiftrates of boroughs, fheriffs, admirals, and commiffaries. If the debtor does not obey the will of the letters of horning within the days of the charge, the charger, after denouncing him rebel, and regiftring the horning, may apply for letters of caption, which contain a command, not only to meffengers, but to magiftrates, to apprehend and imprifon the debtor. All meffengers and magiftrates, who refufe their affiftance in executing the caption, are liable *fubfidarie* for the debt; and fuch fubfidiary action is fupported by the execution of the meffenger employed by the creditor, expreffing that they were charged to concur, and would not. Letters of caption contain an exprefs warrant to the meffenger, in cafe he cannot get accefs, to break open all doors, and other lock faft places.

9. Law fecures peers, married women, and pupils, againft perfonal execution by caption upon civil debts. No caption can be executed againft a debtor within the precincts of the King's palace of Holyroodhoufe: But this privilege of fanctuary afforded no fecurity to criminals, as that did which was, by the canon law, conferred on churches and religious houfes. Where the perfonal prefence of a debtor, under caption, is neceffary in any of our fupreme courts, the judges are empowered to grant him a protection, for fuch time as may be fufficient for his coming and going, not exceeding a month.

10. After a debtor is imprifoned, he ought not to be indulged the benefit of the air, not even under a guard; for creditors have an intereft, that their debtors be kept under clofe confinement, that, by the *fqualor carceris*, they may be brought to pay their debt: And any magiftrate or jailor, who fhall fuffer the prifoner to go abroad, without a proper atteftation, upon oath, of the dangerous ftate of his health. is liable *fubfidarie* for the debt. Magiftrates are in like manner liable, if they fhall fuffer a prifoner to efcape, through the infufficiency of their prifon: But, if he fhall efcape under night, by the ufe of inftruments, or by open force, or by any other accident which cannot be imputed to the magiftrates or jailor, they are not chargeable with the debt; provided they fhall have, immediately after his efcape, made all poffible fearch for him. Regularly, no prifoner for debt upon letters of caption, though he fhould have made payment, could be releafed without letters of fufpenfion, containing a charge to the jailor to fet him at liberty; becaufe the creditor's difcharge could not take off the penalty incurred by the debtor for contempt of the King's authority: But to fave unneceffary expence to debtors in fmall debts, jailors are empowered to let go prifoners where the debt does not exceed 200 merks *Scots*, upon production of a difcharge, in which the creditor confents to his releafe.

11. Our

11. Our law, from a confideration of compaffion, allows infolvent debtors to apply for a releafe from prifon, upon a *ceffio bonorum*, *i. e.* upon their making over to the creditors all their eftate, real and perfonal. This muft be infifted for, by way of action, to which all the creditors of the prifoner ought to be made parties. The prifoner muft, in this action, which is cognifable only by the court of Seffion, exhibit a particular inventory of his eftate, and make oath that he has no other eftate than is therein contained, and that he has made no conveyance of any part of it, fince his imprifonment, to the hurt of his creditors. He muft alfo make oath, whether he has granted any difpofition of his effects before his imprifonment, and condefcend on the perfons to whom, and on the caufe of granting it; that the court may judge, whether, by any collufive practice, he has forfeited his claim to liberty.

12. A fraudulent bankrupt is not allowed this privilege; nor a criminal who is liable in an affythment or indemnification to the party injured or his executors, though the crime itfelf fhould be extinguifhed by a pardon. A difpofition granted on a *ceffio bonorum* is merely in farther fecurity to the creditors, not in fatisfaction or *in folutum* of the debts. If therefore, the debtor fhall acquire any eftate after his releafe, fuch eftate may be attached by his creditors, as if there had been no *ceffio*, except in fo far as is neceffary for his fubfiftence. Debtors, who are fet free on a *ceffio bonorum*, are obliged to wear a habit proper to dyvours or bankrupts. The Lords are prohibited to difpenfe with this mark of ignominy, unlefs, in the fummons and procefs of *ceffio*, it be libelled, fuftained, and proved, that the bankruptcy proceeds from misfortune. And bankrupts are condemned to fubmit to the habit, even where no fufpicion of fraud lies againft them, if they have been dealers in an illicite trade.

13. Where a prifoner for debt declares upon oath, before the magiftrate of the jurifdiction, that he has not wherewith to maintain himfelf, the magiftrate may fet him at liberty, if the creditor, in confequence of whofe diligence he was imprifoned, does not aliment him within ten days after intimation made for that purpofe. But the magiftrate may, in fuch cafe, detain him in prifon, if he chufes to bear the burden of the aliment, rather than releafe him. The ftatute authorifing this releafe, which is ufually called the act of grace, is limited to the cafe of prifoners for civil debts.

14. Decrees are executed againft the moveable eftate of the debtor by arreftment or poinding; and againft his heritable eftate, by inhibition, or adjudication. If one be condemned, in a removing or other procefs, to quit the poffeffion of lands, and refufes, notwithftanding a charge, letters of ejection are granted of courfe, ordaining the fheriff to eject him, and to enter the obtainer of the decree into poffeffion. Where one oppofes by violence the execution of a decree, or of any lawful diligence, which the civil magiftrate is not able by himfelf and his officers to make good, the execution is enforced *manu militari*.

15. A decree-arbitral, which is a fentence proceeding on a fubmiffion to arbiters, has fome affinity with a judicial fentence, though in moft refpects the two differ. A fubmiffion is a contract entered into, by two or more parties who have difputable rights or claims, whereby they refer their differences to the final determination of an arbiter or arbiters, and oblige themfelves to acquiefce in what fhall be decided. Where the day within which the arbiters are to decide, is left blank in the fubmiffion, practice has limited the arbiters power of deciding to a year. As this has proceeded from the ordinary words of ftyle, empowering the arbiters to determine betwixt and the day of next to come; therefore, where a fubmiffion is indefinite, without fpecifying any time, like all other contracts or obligations, it fubfifts for forty years. Submiffions, like mandates, expire by the death of any of the parties-fubmitters before fentence. As arbiters are not vefted with jurifdiction, they cannot compel witneffes to make oath before them, or havers of writings to exhibit them; but this defect is fupplied by the court of Seffion, who, at the fuit of the arbiters, or of either of the parties, will grant warrant for citing witneffes, or for the exhibition of writings. For the fame reafon, the power of arbiters is barely to decide; the execution of the decree belongs to the judge. Where the fubmitters confent to the regiftration of the decree-arbitral, performance may be enforced by fummary diligence.

16. The power of arbiters is wholly derived from the confent of parties. Hence, where their powers are limited to a certain day, they cannot pronounce fentence after that day. Nor can they fubject parties to a penalty higher than that which they have agreed to in the fubmiffion. And where a fubmiffion is limited to fpecial claims, fentence pronounced on fubjects not fpecified in the fubmiffion is null, as being *ultra vires compromiffi*.

17. But, on the other part, as fubmiffions are defigned for a moft favourable purpofe, the amicable compofing of differences, the powers thereby conferred on arbiters receive an ample interpretation. Decrees-arbitral are not reducible upon any ground, except corruption, bribery, or falfehood.

Tit. 26. *Of Crimes.*

THE word *crime*, in its moft general fenfe, includes every breach, either of the law of God, or of our country; in a more reftricted meaning, it fignifies fuch tranfgreffions of law as are punifhable by courts of juftice. Crimes were, by the Roman law, divided into public and private. Public crimes were thofe that were exprefsly declared fuch by fome law or conftitution, and which, on account of their more atrocious nature and hurtful confequences, might be profecuted by any member of the community. Private crimes could be purfued only by the party injured, and were generally punifhed by a pecuniary fine to be applied to his ufe. By the law of Scotland, no private party, except the perfon injured, or his next of kin, can accufe criminally: but the King's Advocate, who in this queftion reprefents the community, has a right to profecute all crimes *in vindictam publicam*, though the party injured fhould refufe to concur. Smaller offences, as petty riots, injuries, *&c.* which do not de-

mand the public vengeance, paſs generally by the appellation of delicts, and are puniſhed either by fine or impriſonment.

2. The eſſence of a crime is, that there be an intention in the actor to commit it; for an action in which the will of the agent has no part, is not a proper object either of rewards or puniſhments: Hence ariſes the rule, *crimen dolo contrahitur*. Simple negligence does not therefore conſtitute a proper crime. Yet where it is extremely groſs, it may be puniſhed arbitrarily. Far leſs can we reckon in the number of crimes, thoſe committed by an ideot or furious perſon: But leſſer degrees of fatuity, which only darken reaſon, will not afford a total defence, though they may ſave from the *pœna ordinaria*. Actions committed in drunkenneſs are not to be conſidered as involuntary, ſeeing the drunkenneſs itſelf, which was the firſt cauſe of the action, is both voluntary and criminal.

3. On the ſame principle, ſuch as are in a ſtate of infancy, or in the confines of it, are incapable of a criminal action, dole not being incident to that age; but the preciſe age at which a perſon becomes capable of dole, being fixed neither by nature nor by ſtatute, is by our practice to be gathered by the judge, as he beſt can, from the underſtanding and manners of the perſon accuſed. Where the guilt of a crime ariſes chiefly from ſtatute, the actor, if he is under puberty, can hardly be found guilty; but, where nature itſelf points out its deformity, he may, if he is *proximus pubertati*, be more eaſily preſumed capable of committing it: Yet, even in that caſe, he will not be puniſhed *pœna ordinaria*.

4. One may be guilty of a crime, not only by perpetrating it himſelf, but by being acceſſory to a crime committed by another; which laſt is by civilians ſtyled *ope et conſilio*, and, in our law-phraſe, art and part. A perſon may be guilty, art and part, either by giving advice or counſel to commit the crime; or, 2. By giving warrant or mandate to commit it; or, 3. By actually aſſiſting the criminal in the execution. It is generally agreed by doctors, that, in the more atrocious crimes, the adviſer is equally puniſhable with the criminal; and that, in the ſlighter, the circumſtances ariſing from the adviſer's leſſer age, the jocular or careleſs manner of giving advice, *&c.* may be received as pleas for ſoftening the puniſhment. One who gives mandate to commit a crime, as he is the firſt ſpring of action, ſeems more guilty than the perſon employed as the inſtrument in executing it; yet the actor cannot excuſe himſelf under the pretence of orders which he ought not to have obeyed.

5. Aſſiſtance may be given to the committer of a crime, not only in the actual execution, but previous to it, by furniſhing him, intentionally, with poiſon, arms, or the other means of perpetrating it. That ſort of aſſiſtance which is not given till after the criminal act, and which is commonly called abetting, though it be of itſelf criminal, does not infer art and part of the principal crime; as if one ſhould favour the eſcape of a criminal knowing him to be ſuch. or conceal him from juſtice.

6. Thoſe crimes that are, in their conſequences, moſt hurtful to ſociety, are puniſhed capitally, or by death; others eſcape with a leſſer puniſhment, ſometimes fixed by ſtatute, and ſometimes arbitrary, *i. e.* left to the diſcretion of the judge, who may exerciſe his juriſdiction, either by fine, impriſonment, or a corporal puniſhment. Where the puniſhment is left, by law, to the diſcretion of the judge, he can in no caſe extend it to death. The ſingle eſcheat of the criminal falls on conviction, in all capital trials, though the ſentence ſhould not expreſs it.

7. Certain crimes are committed more immediately againſt God himſelf; others, againſt the ſtate; and a third kind, againſt particular perſons. The chief crime in the firſt claſs, cogniſable by temporal courts, is *blaſphemy*, under which may be included atheiſm. This crime conſiſts in the denying or vilifying the Deity, by ſpeech or writing. All who curſe God or any of the perſons of the bleſſed Trinity, are to ſuffer death, even for a ſingle act; and thoſe who deny him, if they perſiſt in their denial. The denial of a providence, or of the authority of the holy Scriptures, is puniſhable capitally for the third offence.

8. No proſecution can now be carried on for witchcraft or conjuration. But all who undertake, from their ſkill in any occult ſcience, to *tell fortunes, or diſcover ſtolen goods*, are to ſuffer impriſonment for a year, ſtand in the pillory four times in that year, and find ſurety for their future good behaviour.

9. Some crimes againſt the ſtate are levelled directly againſt the ſupreme power, and ſtrike at the conſtitution itſelf; others diſcover ſuch a contempt of law, as tends to baffle authority, or ſlacken the reins of government. *Treaſon, crimen majeſtatis*, is that crime which is aimed againſt the majeſty of the ſtate; and can be committed only by thoſe who are ſubjects of that ſtate either by birth or reſidence. Soon after the union of the two kingdoms in 1707, the laws of treaſon, then in force in England, were made ours by 7 *An. c.* 21. both with regard to the facts conſtituting that crime, to the forms of trial, the corruption of blood, and all the penalties and forfeitures conſequent on it.

10. It is high treaſon, by the law of England, to imagine the death of the King, Queen-conſort, or of the heir apparent of the crown; to levy war againſt the King, or adhere to his enemies; to counterfeit the King's coin, or his great or privy ſeal; to kill the chancellor, treaſurer, or any of the twelve judges of England, while they are doing their offices; which laſt article is by the forenamed act 7. *An.* applied to Scotland, in the caſe of ſlaying any judge of the Seſſion or of Juſticiary ſitting in judgment. Thoſe who waſh, clip, or lighten the proper money of the realm, who adviſedly affirm by writing or printing, that the Pretender has any right to the crown, that the King and Parliament cannot limit the ſucceſſion to it, or who hold correſpondence with the Pretender or any perſon employed by him, are alſo guilty of treaſon.

11. The forms of proceeding in the trial of treaſon, whether againſt Peers or Commoners, are ſet forth in a ſmall treatiſe, publiſhed by order of the houſe of Lords in 1709, ſubjoined to a collection of ſtatutes concerning treaſon. By the conviction upon this trial, the whole eſtate of the traitor forfeits to the crown. His blood is alſo corrupted, ſo that, on the death of an anceſtor, he cannot inherit;

herit; and the eſtate which he cannot take, falls to the immediate ſuperior as eſcheat, *ob defectum heredis*, without diſtinguiſhing whether the lands hold of the crown, or of a ſubject. No attainder for treaſon ſhall, after the death of the Pretender and all his ſons, hurt the right of any perſon, other than that of the offender, during his natural life; The rights of creditors and other third parties in the caſe of forfeiture on treaſon, muſt be determined by the law of England.

12. *Miſpriſion of treaſon*, from *Meprendre*, is the overlooking or concealing of treaſon. It is inferred by one's bare knowledge of the crime, and not diſcovering it to a magiſtrate or other perſon intitled by his office to take examinations; though he ſhould not in the leaſt degree aſſent to it. The foreſaid act 7. *An.* makes the Engliſh law of miſpriſion ours. Its puniſhment is, by the law of England, perpetual impriſonment, together with the forfeiture of the offender's moveables, and of the profits of his heritable eſtate, during his life; that is, in the ſtyle of our law, his ſingle and liferent eſcheat.

13. The crime of *ſedition* conſiſts in the raiſing commotions or diſturbances in the ſtate. It is either verbal or real. Verbal ſedition, or leaſing-making, is inferred from the uttering of words tending to create diſcord between the King and his people. It is puniſhed either by impriſonment, fine, or baniſhment, at the diſcretion of the judge. Real ſedition is generally committed, by convocating together any conſiderable number of people, without lawful authority, under the pretence of redreſſing ſome public grievance, to the diſturbing of the public peace. Thoſe who are convicted of this crime are puniſhed by the confiſcation of their goods; and their lives are at the King's will. If any perſons, to the number of twelve, ſhall aſſemble, and being required by a magiſtrate or conſtable to diſperſe, ſhall neverthelefs continue together for an hour after ſuch command, the perſons diſobeying ſhall ſuffer death and the confiſcation of moveables.

14. Judges, who, wilfully or through corruption, uſe their authority as a cover to injuſtice or oppreſſion, are puniſhed with the loſs of honour, fame, and dignity. Under this head, may be claſſed *theftbote* (from *bote*, compenſation), which is the taking a conſideration in money or goods from a thief to exempt him from puniſhment, or connive at his eſcape from juſtice. A ſheriff or other judge, guilty of this crime, forfeits his life and goods. And even a private perſon, who takes theftbote, ſuffers as the principal thief. The buying of diſputed claims, concerning which there is a pending proceſs, by any judge or member either of the Seſſion, or of an inferior court, is puniſhed by the loſs of the delinquent's office, and all the privileges thereto belonging.

15. Deforcement is the oppoſition given, or reſiſtance made, to meſſengers or other officers, while they are employed in executing the law. The court of Seſſion is competent to this crime. It is puniſhable with the confiſcation of moveables, the one half to the King, and the other to the creditor at whoſe ſuit the diligence was uſed. Armed perſons, to the number of three or more, aſſiſting in the illegal running, landing, or exporting of prohibited or uncuſtomed goods, or any who ſhall reſiſt, wound, or maim any officer of the revenue in the execution of office, are puniſhable with death and the confiſcation of moveables.

16. *Breach of arreſtment*, (ſee Tit. xxv. 5.) is a crime of the ſame nature with deforcement, as it imports a contempt of the law and of our judges. It ſubjects to an arbitrary corporal puniſhment, and the eſcheat of moveables; with a preference to the creditor for his debt, and for ſuch farther ſum as ſhall be modified to him by the judge. Under this head of crimes againſt good government and police, may be reckoned the *foreſtalling of markets*; that is, the buying of goods intended for a public market, before they are carried there; which for the third criminal act, infers the eſcheat of moveables; as alſo ſlaying ſalmond in forbidden time, deſtroying plough-graith in time of tillage, ſlaying or houghing horſes or cows in time of harveſt, and deſtroying or ſpoiling growing timber; as to the puniſhment of which, ſee ſtatutes 1503, *c.* 72,—1587, *c.* 82, and 1698, *c.* 16—1. *Geo.* I. *St.* 2. *c.* 48.

17. Crimes againſt particular perſons may be directed, either againſt life, limb, liberty, chaſtity, goods, or reputation. *Murder* is the wilful taking away of a perſon's life, without a neceſſary cauſe. Our law makes no diſtinction betwixt premeditated and ſudden homicide; both are puniſhed capitally. Caſual homicide, where the actor is in ſome degree blameable, and homicide in ſelf-defence, where the juſt bounds of defence have been exceeded, are puniſhed arbitrarily; but the ſlaughter of night-thieves, houſe-breakers, aſſiſtants in maſterful depredations, or rebels denounced for capital crimes, may be committed with impunity. The crime of *demembration*, or the cutting off of a member, is joined with that of murder; but in practice, its puniſhment has been reſtricted to the eſcheat of moveables, and an aſſythment or indemnification to the party. *Mutilation*, or the diſabling of a member, is puniſhed at the diſcretion of the judge.

18. *Self-murder* is as highly criminal as the killing our neighbour; and for this reaſon, our law has, contrary to the rule, *crimina morte extinguuntur*, allowed a proof of the crime, after the offender's death, that his ſingle eſcheat might fall to the King or his donatory. To this end, an action muſt be brought, not before the Juſticiary, but the Seſſion, becauſe it is only intended *ad civilem effectum*, for proving and declaring the ſelf-murder; and the next of kin to the deceaſed muſt be made a party to it.

19. The puniſhment of parricide, or of the murder of a parent, is not confined, by our law, to the criminal himſelf. All his poſterity in the right line are declared incapable of inheriting; and the ſucceſſion devolves on the next collateral heir. Even the curſing or beating of a parent infers death, if the perſon guilty be above fixteen years; and an arbitrary puniſhment, if he be under it. A preſumptive or ſtatutory murder is conſtituted by 1690, *c.* 21. by which any woman who ſhall conceal her pregnancy, during its whole courſe, and ſhall not call for, or make uſe of help in the birth, is to be reputed the murderer, if the child be dead, or amiſſing. This act was intended to diſcourage the unnatural practice of wo-

men

men making away with their children begotten in fornication, to avoid church-cenſures.

20. *Duelling*, is the crime of fighting in ſingle combat, on previous challenges given and received. Fighting in a duel, without licence from the King, is puniſhable by death; and whatever perſon, principal or ſecond, ſhall give a challenge to fight a duel, or ſhall accept a challenge, or otherwiſe engage therein, is puniſhed by baniſhment and eſcheat of moveables, though no actual fighting ſhould enſue.

21. *Haimſucken*, (from *haim*, home, and *ſocken*, to ſeek or purſue,) is the aſſaulting or beating of a perſon in his own houſe. The puniſhment of this crime is no where defined, except in the books of the Majeſty, which make it the ſame as that of a rape; and it is, like rape, capital by our practice. The aſſault muſt be made in the proper houſe of the perſon aſſaulted, where he lies and riſes daily and nightly, ſo that neither a public houſe, nor even a private, where one is only tranſiently, falls within the law.

22. Any party to a law-ſuit, who ſhall ſlay, wound, or otherways invade his adverſary, at any period of time between executing the ſummons and the compleat execution of the decree, or ſhall be acceſſory to ſuch invaſion, ſhall loſe his cauſe. The ſentence pronounced on this trial, againſt him who has committed the battery, is not ſubject to reduction, either on the head of minority, or any other ground whatever: And if the perſon proſecuted for this crime ſhall be denounced for not appearing, his liferent, as well as ſingle eſcheat, falls upon the denunciation.

23. The crime of *wrongous impriſonment* is inferred, by granting warrants of commitment in order to trial, proceeding on informations not ſubſcribed, or without expreſſing the cauſe of commitment; by receiving or detaining priſoners on ſuch warrants; by refuſing to a priſoner a copy of the warrant of commitment; by detaining him in cloſe confinement, above eight days after his commitment; by not releaſing him on bail, where the crime is bailable; and by tranſporting perſons out of the kingdom, without either their own conſent, or a lawful ſentence. The perſons guilty of a wrongous impriſonment, are puniſhed by a pecuniary mulct, from L. 6000 down to L. 400 *Scots*, according to the rank of the perſon detained: and the judge or other perſon guilty, is over and above ſubjected to pay to the perſon detained a certain ſum *per diem*. proportioned to his rank, and is declared incapable of public truſt. All theſe penalties may be inſiſted for by a ſummary action before the ſeſſion, and are ſubject to no modification.

24. *Adultery*, is the crime by which the marriage-bed is polluted. This crime could, neither by the Roman nor Jewiſh law, be committed, but where the guilty woman was the wife of another: By ours, it is adultery, if either the man or woman be married. We diſtinguiſh between ſimple adultery, and that which is notorious or manifeſt. Open and manifeſt adulterers, who continue incorrigible, notwithſtanding the cenſures of the church, are puniſhed capitally. This crime is diſtinguiſhed by one or other of the following characters; where there is iſſue procreated between the adulterers; or where they keep bed and company together notoriouſly; or where they give ſcandal to the church, and are, upon their obſtinate refuſing to liſten to their admonitions, excommunicated. The puniſhment of ſimple adultery, not being defined by ſtatute, is left to the diſcretion of the judge; but cuſtom has made the falling of the ſingle eſcheat one of its penalties.

25. *Bigamy*, is a perſon's entering into the engagements of a ſecond marriage, in violation of a former marriage vow ſtill ſubſiſting. Bigamy. on the part of the man, has been tolerated in many ſtates, before the eſtabliſhment of Chriſtianity, even by the Jews themſelves; but it is prohibited by the precepts of the goſpel, and it is puniſhed by our law, whether on the part of the man, or of the woman, with the pains of perjury.

26. *Inceſt*, is committed by perſons who ſtand within the degrees of kindred forbidden in *Lev*. xviii. and is puniſhed capitally. The ſame degrees are prohibited in affinity, as in conſanguinity, *Lev*. xviii. 13. *et ſeq*. As this crime is repugnant to nature, all children, whether lawful or natural, ſtand on an equal footing: *Civilis ratio civilia jura corrumpere poteſt, non vero naturalia*. It is difficult indeed to bring a legal proof of a relation merely natural, on the ſide of the father; but the mother may be certainly known without marriage.

26. There is no explicite ſtatute making rape, or the raviſhing of women, capital; but it is plainly ſuppoſed in act 16 12, *c*. 4. by which the raviſher is exempted from the pains of death, only in the caſe of the woman's ſubſequent conſent, or her declaration that ſhe went off with him of her own free-will; and even then, he is to ſuffer an arbitrary puniſhment, either by impriſonment, confiſcation of goods, or a pecuniary fine.

28. *Theft* is defined, a fraudulent intermedling with the property of another, with a view of making gain. Our ancient law proportioned the puniſhment of the theft to the value of the goods ſtolen; heightening it gradually, from a ſlight corporal puniſhment to a capital, if the value amounted to thirty two pennies Scots, which in the reign of David I. was the price of two ſheep. In ſeveral later acts, it is taken for granted, that this crime is capital. But where the thing ſtolen is of ſmall value, we conſider it, not as theft, but as pickery, which is puniſhed either corporally or by baniſhment. The breaking of orchards, and the ſtealing of green wood, is puniſhed by a fine, which riſes as the crime is repeated.

29. Theft may be aggravated into a capital crime, though the value of the thing ſtolen be trifling; as theft twice repeated, or committed in the night, or by landed men; or of things ſet apart for ſacred uſes. The receivers and concealers of ſtolen goods, knowing them to be ſuch, ſuffer as thieves. Thoſe who barely harbour the perſon of the criminal within forty-eight hours either before or after committing the crime, are puniſhed as partakers of the theft. Such as ſell goods belonging to thieves or lawleſs perſons who dare not themſelves come to market, are puniſhed with baniſhment and the eſcheat of moveables.

30. Theft attended with violence, is called *robbery*; and in our old ſtatutes, *rief or ſtouthrief*, under which claſs may be included *forning*, or the taking of meat and drink by force, without paying for it, Stouthrief came at

at laſt to be committed ſo audaciouſly, by bands of men aſſociated together, that it was thought neceſſary to veſt all our freeholders with a power of holding courts upon ſorners and rievers, and condemning them to death. Nay, all were capitally puniſhed, who, to ſecure their lands from depredation, paid to the rievers a yearly contribution, which got the name of *black-mail*. An act alſo paſſed, commanding to baniſhment a band of ſorners, who were originally from *Egypt*, called *Gypſies*, and adjudging to death all that ſhould be reputed *Egyptians*, if found thereafter within the kingdom. Robbery committed on the ſeas, is called *piracy*, and is puniſhed capitally by the high admiral. Several of the facts which conſtitute this crime are ſet forth in a Britiſh ſtatute, 8. *Geo.* I. *c* 24.

31. *Falſehood*, in a large ſenſe, is the fraudulent imitation or ſuppreſſion of truth, to the damage of another. The lateſt ſtatute againſt this crime, puniſhes it by confiſcation of moveables. That particular ſpecies of falſehood, which conſiſts in the falſifying of writings, paſſes by the name of *forgery*. Our practice has now of a long time, agreeably to the Roman law, made this crime capital; unleſs the forgery be of executions, or other writings of ſmaller moment; in which caſe, it is puniſhed arbitrarily.

32. The writing muſt not only be fabricated, but put to uſe or founded on, in order to infer this crime. And though it be ſtrictly criminal, yet the trial of it is proper to the court of Seſſion; but where improbation is moved againſt a deed by way of exception, the inferior judge, before whom the action lies, is competent to it *ad civilem effectum*. When it is pleaded as an exception, our practice, to diſcourage affected delays, obliges the defender, who moves it, to conſign L. 40 Scots; which he forfeits, if his plea ſhall appear calumnious.

33. Where a perſon, found guilty of forgery by the court of Seſſion, is by them remitted to the Juſticiary, an indictment is there exhibited againſt him, and a jury ſworn, before whom the decree of Seſſion is produced, in place of all other evidence of the crime, in reſpect of which the jury find the pannel guilty; ſo that that decree, being pronounced by a competent court, is held as full proof, or, in the ſtyle of the bar, as *probatio probata*.

34. *Perjury*, which is the judicial affirmation of a falſehood on oath, really conſtitutes the *crimen falſi*; for he who is guilty of it does, in the moſt ſolemn manner, ſubſtitute falſehood in the place of truth. To conſtitute this crime, the violation of truth muſt be deliberately intended by the ſwearer; and therefore reaſonable allowances ought to be given to forgetfulneſs or miſapprehenſion, according to his age, health, and other circumſtances. The breach of a promiſſory oath does not infer this crime; for he who promiſes on oath, may ſincerely intend performance when he ſwears, and ſo cannot be ſaid to call on God to atteſt a falſehood. Though an oath, however falſe, if made upon reference in a civil queſtion, concludes the cauſe, the perſon perjured is liable to a criminal trial; for the effect of the reference can go no farther than the private right of the parties.

35. Notwithſtanding the miſchievous conſequences of perjury to ſociety, it is not puniſhed capitally, but by confiſcation of moveables, impriſonment for a year, and infamy. The court of Seſſion is competent to perjury *incidenter*, when in any examination upon oath, taken in a cauſe depending before them, a perſon appears to have ſworn falſely; but in the common caſe, that trial is proper to the Juſticiary. *Subornation of perjury* conſiſts in tampering with perſons who are to ſwear in judgment, by directing them how they are to depoſe; and it is puniſhed with the pains of perjury.

36. The crime of *ſtellionate*, from *ſtellio*, includes every fraud which is not diſtinguiſhed by a ſpecial name; but is chiefly applied to conveyances of the ſame numerical right, granted by the proprietor to different diſponees. The puniſhment of ſtellionate muſt neceſſarily be arbitrary, to adapt it to the various natures and different aggravations of the fraudulent acts. The perſons guilty of that kind of it, which conſiſts in granting double conveyances, are by our law declared infamous, and their lives and goods at the King's mercy. The cogniſance of *fraudulent bankruptcy* is appropriated to the court of Seſſion, who may inflict any puniſhment on the offender, that appears proportioned to his guilt, death excepted.

37. The crime of *uſury*, before the reformation, conſiſted in the taking of *any* intereſt for the uſe of money; and now in taking an higher rate of intereſt than is authoriſed by law. It is divided into *uſura manifeſta*, or direct; and *velata*, or covered. One may be guilty of the firſt kind, either where he covenants with the debtor for more than the lawful intereſt on the loan-money; or where one receives the intereſt of a ſum before it is due, ſince thereby he takes a conſideration for the uſe of money before the debtor has really got the uſe of it. Where a debt is clogged with an uncertain condition, by which the creditor runs the hazard of loſing his ſum, he may covenant for an higher intereſt than the legal, without the crime of uſury; for there, the intereſt is not given merely in conſideration of the uſe of the money, but of the danger undertaken by the creditor.

38. Covered uſury, is that which is committed under the maſk, not of a loan, but of ſome other contract; *e. g.* a ſale, or an improper wadſet. And in general, all obligations entered into with an intention of getting more than the legal intereſt for the uſe of money, however they may be diſguiſed, are uſurious. As a farther guard againſt this crime, the taking more than the legal intereſt for the forbearance of payment of money, merchandiſe, or other commodities, by way of loan, exchange, or other contrivance whatever; or the taking a bribe for the loan of money, or for delaying its payment when lent, is declared uſury. Where uſury is proved, the uſurious obligation is not only declared void, but the creditor, if he has received any unlawful profits, forfeits the treble value of the ſums or goods lent. Uſury, when it is to be purſued criminally, muſt be tried by the Juſticiary; but where the libel concludes only for voiding the debt or reſtitution, the ſeſſion is the proper court.

39. *Injury*, in its proper acceptation, is the reproaching or affronting our neighbour. Injuries are either verbal or real. A verbal injury, when directed againſt a private perſon, conſiſts in the uttering contumelious words, which tend to expoſe our neighbour's character by making him little or ridiculous. It does not ſeem that the twit-

ting one with natural defects, without any farcaftical reflections, though ir be inhuman, falls under this defcription, as thefe imply no real reproach in the juft opinion of mankind. Where the injurious expreffions have a tendency to blacken one's moral character, or fix fome particular guilt upon him, and are deliberately repeated in different companies, or handed about in whifpers to confidents, it then grows up to the crime of flander: and where a perfon's moral character is thus attacked, the *animus injuriandi* is commonly inferred from the injurious words themfelves, unlefs fpecial circumftances be offered to take off the prefumption; *ex. gr.* that the words were uttered in judgment in one's own defence, or by way of information to a magiftrate, and had fome foundation in fact. Though the cognizance of flander is proper to the commiffaries, who, as the *judices Chrifti anitatis*, are the only judges of fcandal; yet for fome time paft, bare verbal injuries have been tried by other criminal judges, and even by the Seffion. It is punifhed either by a fine, proportioned to the condition of the perfons injuring and injured, and the circumftances of time and place; or if the injury import fcandal by publicly acknowledging the offence; and frequently the two are conjoined. The calling one a bankrupt is not, in ftrict fpeech, a verbal injury, as it does not affect the perfon's moral character; yet as it may hurt his credit in the way of bufinefs, it founds him in an action of damages, which muft be brought before the judge ordinary. A real injury is inflicted by any fact by which a perfon's honour or dignity is affected; as ftriking one with a cane, or even aiming a blow without ftriking; fpitting in one's face; affuming a coat of arms, or any other mark of diftinction proper to another, *&c.* The compofing and publifhing defamatory libels may be reckoned of this kind. Real injuries are tried by the judge-ordinary, and punifhed, either by fine or imprifonment, according to the demerit of the offenders.

40. After having fhortly explained the feveral crimes punifhable by our law, this treatife may be concluded, with a few obfervations on criminal jurifdiction, the forms of trial, and the methods by which crimes may be extinguifhed. Criminal jurifdiction is founded, 1. *Ratione domicilii*, if the defender dwells within the territory of the judge. Vagabonds, who have no certain domicile, may be tried where-ever they are apprehended. 2. *Ratione delicti*, if the crime was committed within the territory. Treafon is triable, by the Englifh law, in any county that the King fhould appoint; and by a temporary act now expired, treafon committed in certain Scots counties, was made triable by the court of Jufticiary, where-ever it fhould fit.

41. No criminal trial can proceed, unlefs the perfon accufed is capable of making his defence. Abfents therefore cannot be tried; nor fatuous nor furious perfons, *durante furore*, even for crimes committed, while they were in their fenfes. For a like reafon, minors who had no curators could not, by the Roman law, be tried criminally; but our practice confiders every perfon who is capable of dole, to be alfo fufficiently qualified for making his defence in a criminal trial.

42. No perfon can be imprifoned in order to ftand trial for any crime, without a warrant in writing expreffing the caufe, and proceeding upon a fubfcribed information, unlefs in the cafe of indignities done to judges, riots, and the other offences fpecially mentioned in 1701, *c.* 6. Every prifoner committed in order to trial, if the crime of which he is accufed be not capital, is entitled to be releafed upon bail, the extent of which is to be modified by the judge, not exceeding 12000 merks Scots for a Nobleman, 6000 for a landed gentleman, 2000 for any other gentleman or burgefs, and 600 for any other inferior perfon. That perfons who, either from the nature of the crime with which they are charged, or from their low circumftances, cannot procure bail, may not lie for ever in prifon untried, it is lawful to every fuch prifoner, to apply to the criminal judge, that his trial may be brought on. The judge muft, within twenty-four hours after fuch application, iffue letters directed to meffengers, for intimating to the profecutor to fix a diet for the prifoner's trial, within fixty days after the intimation, under the pain of wrongous imprifonment: And if the profecutor does not infift within that time, or if the trial is not finifhed in forty days more, when carried on before the Jufticiary, or in thirty, when before any other judge; the prifoner is, upon a fecond application, fetting forth that the legal time is elapfed, entitled to his freedom, under the fame penalty.

43. Upon one's committing any of the groffer crimes, it is ufual for a juftice of the peace, fheriff, or other judge, to take a precognition of the facts, *i. e.* to examine thofe who were prefent at the criminal act, upon the fpecial circumftances attending it, in order to know whether there is ground for a trial, and to ferve as a direction to the profecutor, how to fet forth the facts in the libel; but the perfons examined may infift to have their declarations cancelled, before they give teftimony at the trial. Juftices of the peace, fheriffs, and magiftrates of boroughs, are alfo authorifed to receive informations, concerning crimes to be tried in the circuit-courts; which informations are to be tranfmitted to the juftice clerk forty days before the fitting of the refpective courts. To difcourage groundlefs criminal trials, all profecutors, where the defender was abfolved, were condemned by ftatute, in cofts, as they fhould be modified by the judge, and befides were fubjected to a fmall fine to be divided between the fifk and the defender: And where the King's advocate was the only purfuer, his informer was made liable. This fufficiently warrants the prefent practice of condemning vexatious profecutors in a pecuniary mulct, though far exceeding the ftatutory fum.

44. The forms of law upon criminal accufations, differ much from thofe obferved in civil actions, if we except the cafe of fuch crimes as the court of Seffion is competent to, and of leffer offences tried before inferior courts. The trial of crimes proceeds, either upon indictment, which is fometimes ufed, when the perfon to be tried is in prifon; or by crinal letters iffuing from the fignet of the Jufticiary. In either cafe, the defender muft be ferved with a full copy of the indictment or letters, and with a lift of the witneffes to be brought againft him, and of the perfons who are to pafs on the inqueft, and fifteen free days muft intervene, between his being

fo-

ſo ſerved, and the day of appearance. When the trial proceeds upon criminal letters, the private proſecutor muſt give ſecurity, at raiſing the letters, that he will report them duly executed to the Juſticiary, in terms of 1535, *c.* 35; and the defender, if he be not already in priſon, is, by the letters, required to give caution, within a certain number of days after his citation, for his appearance upon the day fixed for his trial: And if he gives none within the days of the charge, he may be denounced rebel, which infers the forfeiture of his moveables.

45. That part of the indictment, or of the criminal letters, which contains the ground of the charge againſt the defender, and the nature or degree of the puniſhment he ought to ſuffer, is called the libel. All libels muſt be ſpecial, ſetting forth the particular facts inferring the guilt, and the particular place where theſe facts were done. The time of committing the crime may be libelled in more general terms, with an alternative as to the month, or day of the month: but as it is not practicable in moſt caſes, to libel upon the preciſe circumſtances of acceſſion that may appear in proof, libels againſt acceſſories are ſufficient, if they mentioned, in general, that the perſons proſecuted are guilty art and part.

46. The defender, in a criminal trial, may raiſe letters of exculpation, for citing witneſſes in proof of his defences againſt the libel, or of his objections againſt any of the jury or witneſſes; which muſt be executed, to the ſame day of appearance, with that of the indictment or criminal letters.

47. The diets of appearance, in the court of Juſticiary, are peremptory; the criminal letters muſt be called on the very day to which the defender is cited; and hence, if no accuſer appears, their effect is loſt, *inſtantia perit*, and new letters muſt be raiſed. If the libel, or any of the executions, ſhall to the proſecutor appear informal, or if he be diffident of the proof, from the abſconding of a neceſſary witneſs, the court will, upon a motion made by him, deſert the diet *pro loco et tempore*; after which new letters become alſo neceſſary. A defender, who does not appear on the day to which he is cited, is declared fugitive; in conſequence of which, his ſingle eſcheat falls. The defender, after his appearance in court, is called the pannel.

48. The two things to be chiefly regarded in a criminal libel, are, 1. The relevancy of the facts, *i. e.* their ſufficiency to infer the concluſion; 2. Their truth. The conſideration of the firſt belongs to the judge of the court; that of the other, to the jury or aſſize. If the facts libelled be found irrelevant, the pannel is diſmiſſed from the bar; if relevant, the court remits the proof thereof to be determined by the jury; which muſt conſiſt of 15 men picked out by the court from a greater number not exceeding 45, who have been all ſummoned, and given in liſt to the defender at ſerving him with a copy of the libel.

49. Crimes cannot, like debts, be referred to the defender's oath; for no perſon is compellable to ſwear againſt himſelf, where his life, limb, liberty, or eſtate is concerned, nor even in crimes which infer infamy; becauſe one's good name is, in right eſtimation, as valuable as his life. There is one exception however to this rule in trying the crime of uſury, which may be proved by the uſurer's own oath, notwithſtanding the rule, *nemo tenetur jurare in ſuam turpitudinem*. Crimes therefore are in the general caſe proveable only by the defender's free confeſſion, or by writing, or by witneſſes. No extrajudicial confeſſion, unleſs it is adhered to by the pannel in judgment, can be admitted as evidence.

50. All objections relevant againſt a witneſs in civil caſes, are alſo relevant in criminal. No witneſs is admitted, who may gain or loſe by the event of the trial. *Socii criminis*, or aſſociates in the ſame crime, are not admitted againſt one another, except either in crimes againſt the ſtate, as treaſon; in occult crimes, where other witneſſes cannot be had, as forgery; or in thefts or depredations committed in the Highlands. The teſtimony of the private party injured may be received againſt the pannel, where the King's Advocate is the only proſecutor, if, from the nature of the crime, there muſt needs be a penury of witneſſes, as in rape, robbery, *&c.*

51. After all the witneſſes have been examined in court, the jury are ſhut up in a room by themſelves, where they muſt continue, excluded from all correſpondence, till their verdict or judgment be ſubſcribed by the foreman (or chancellor), and clerk; and according to this verdict, the court pronounces ſentence, either abſolving or condemning. It is neceſſary, by the law of Scotland, that a jury ſhould be unanimous in finding a perſon guilty; the narroweſt majority is as ſufficient againſt the pannel, as for him. Juries cannot be puniſhed on account of an erroneous verdict, either for or againſt the pannel.

52. Though the proper buſineſs of a jury be to inquire into the truth of the facts found relevant by the court, for which reaſon they are ſometimes called the inqueſt; yet, in many caſes, they judge alſo in matters of law or relevancy. Thus, though an objection againſt a witneſs ſhould be repelled by the court, the jury are under no neceſſity to give more credit to his teſtimony than they think juſt: And in all trials of art and part, where ſpecial facts are not libelled, the jury, if they return a general verdict, are indeed judges, not only of the truth, but of the relevancy of the facts that are ſworn to by the witneſſes. A general verdict, is that which finds, in general terms, that the pannel is guilty or not guilty, or that the libel or defences are proved or not proved. In a ſpecial verdict, the jury finds certain facts proved, the import of which is to be afterwards conſidered by the court.

53. Criminal judges muſt now ſuſpend for ſome time the execution of ſuch ſentences as affect life or limb, that ſo condemned criminals, whoſe caſes deſerve favour, may have acceſs to apply to the king for mercy. No ſentence of any court of judicature, ſouth of the river Forth, importing either death or demembration, can be executed in leſs than thirty days; and, if north of it, in leſs than forty days, after the date of the ſentence. But corporal puniſhments, leſs than death or diſmembering, *e. g.* whipping, pillory, *&c.* may be inflicted eight days after ſentence on this ſide Forth, and twelve days after ſentence beyond it.

54. Crimes are extinguiſhed, 1. By the death of the criminal; both becauſe a dead perſon can make no defence, ſo that his trial is truly a judging upon the hearing of

of one fide; and becaufe, though his guilt fhould be ever fo notorious, he is after death carried beyond the reach of human penalties: Such trials therefore can have no effect, but to punifh the innocent heir, contrary to that moft equitable rule, *culpa tenet fuos auctores*. 2. Crimes may be extinguifhed by a remiffion from the Sovereign. But a remiffion, though it fecures the delinquent from the public refentment, the exercife of which belongs to the Crown, cannot cut off the party injured from his claim of damages, over which the Crown has no prerogative. Whoever therefore founds on a remiffion, is liable in damages to the private profecutor, in the fame manner, as if he had been tried and found guilty. Even general acts of indemnity paffed in parliament, though they fecure againft fuch penalties as law inflicts upon the criminal, merely *per modum pœnæ*, yet do not againft the payment of any pecuniary fine, which is given by ftatute to the party injured, nor againft the demand of any claim competent to him in name of damages.

55. Leffer injuries, which cannot be properly faid to affect the public peace, may be extinguifhed, either by the private party's exprefsly forgiving them, or by his being reconciled to the offender, after receiving the injury. Hence arifes the rule, *diffimulatione tollitur injuria*. But where the offence is of a higher nature, the party injured, though he may pafs from the profecution, in fo far as his private intereft is concerned, cannot preclude the King's Advocate, or Procurator-fifcal, from infifting *ad vindictam publicam*.

56. Crimes are alfo extinguifhed by prefcription, which operates by the mere lapfe of time, without any act, either of the Sovereign or of the private fufferer. Crimes prefcribe in twenty years; but in particular crimes, the prefcription is limited by ftatute to a fhorter time. No perfon can be profecuted upon the act againft wrongous imprifonment, after three years. High treafon, committed within his Majefty's dominions, fuffers likewife a triennial prefcription, if indictment be not found againft the traitor within that time. All actions, brought upon any penal ftatute made or to be made, where the penalty is appropriated to the Crown, expire in two years after committing the offence; and where the penalty goes to the Crown or other perfecutor, the profecutor muft fue within one year, and the Crown within two years after the year ended. Certain crimes are, without the aid of any ftatute, extinguifhed by a fhorter prefcription than twenty years. By our old law, in the cafes of rape, robbery, and hame-fucken, the party injured was not heard, after a filence of twenty four hours; from a prefumption, that perfons could not be fo grofsly injured, without immediately complaining: And it is probable, that a profecution for thefe crimes, if delayed for any confideraby time, would be caft even at this day, or at leaft the punifhment reftricted. Leffer injuries fuffer alfo a fhort prefcription; law *prefuming* forgivenefs, from the nature of the offence, and the filence of the party. The particular fpace of time fufficient to eftablifh this prefumption muft be determined by the judge, according to circumftances.

LAWBURROWS, in Scots Law. See LAW, Tit xxx. 16.

LAWLESS COURT, a court faid to be held annually on King's hill, at Rochford, in Effex, on the Wednefday morning after Michaelmas day, at cock-crowing, where they whifper, and have no candle nor any pen and ink, but only a coal. Perfons who owe fuit, or fervice, and do not appear, forfeit double their rent every hour they are miffing.

This fervile attendance, Cambden informs us, was impofed on the tenants for confpiring at the like unfeafonable time to raife a commotion. The court belongs to the honour of Raleigh, and to the earl of Warwick; and is called lawlefs, from its being held at an unlawful hour.

LAWN, a fpacious plain in a park, or adjoining to a noble feat.

LAWSONIA, in botany, a genus of the octandria monogynia clafs. The calix confifts of four fegments, and the corolla of four petals; the ftamina are difpofed in pairs; and there are four capfules containing a great many feeds. There are two fpecies, both natives of India.

LAWYER fignifies a counfellor, or one that is learned or fkilled in the law.

LAY-BROTHERS, among the Romanifts, thofe pious, but illiterate perfons, who devote themfelves, in fome convent, to the fervice of the religious, They wear a different habit from that of the religious, but never enter into the choir, nor are prefent at the chapters; nor do they make any other vow, except of conftancy and obedience. In nunneries, there are alfo lay-fifters.

LAY-MAN, one who follows a fecular employment, or has not entered into holy orders.

LAYERS, in gardening, are tender fhoots, or twigs of trees, laid or buried in the ground; till having ftruck root, they are feparated from the parent-tree, and become diftinct plants.

LAZAR-HOUSE, or LAZARETTO, a public-building, in the nature of an hofpital, to receive the poor and thofe afflicted with contagious diftempers. In fome places, lazarettos are appointed for the performance of quarrantine; in which cafe, thofe are obliged to be confined in them who are fufpected to have come from places infected with the plague.

LAZARITES, or *Fathers of St* LAZARUS, a religious congregation of regular clerks, inftituted in France in the feventeenth century, by M. Vincent. They take their name from a houfe in the fuburbs of Paris, where they have a feminary, called the feminary of good children. The vows they make are fimple; and, upon occafion, may be difpenfed with.

LAZULI, *or Lapis* LAZULI, in natural hiftory, one of the ores of copper, the bafis of which is a cryftalline matter, coloured with that elegant blue which copper gives to all alkaline liquors.

The

The lapis lazuli is found in many parts of the world; but that of Aſia and Africa is much ſuperior both in beauty and real value to the Bohemian and German kind, which is too often ſold in its place.

Its great uſe, beſide the poliſhing as a gem, is the making the fine blue uſed in painting called ultramarine, which is obtained from it by calcination.

LEAD. See CHEMISTRY, p. 84, 186.

LEAF, *folium*, in the natural hiſtory of plants. See BOTANY, ſect. 2.

LEAF, in clocks and watches, an appellation given to the notches of their pinions. See WATCH.

LEAGUE, a meaſure of length, containing more or leſs geometrical paces, according to the different uſages and cuſtoms of countries. A league at ſea, where it is chiefly uſed by us, being a land-meaſure moſtly peculiar to the French and Germans, contains three thouſand geometrical paces, or three Engliſh miles.

LEAGUE alſo denotes an alliance or confederacy between princes and ſtates for their mutual aid, either in attacking ſome common enemy, or in defending themſelves.

LEAK, among ſeamen, is a hole in the ſhip through which the water comes in. To ſpring a leak, is ſaid of a ſhip that begins to leak. To ſtop a leak, is to fill it with a plug wrapt in oakam and well tarred, or putting in a tarpawling clout to keep the water out; or nailing a-piece of ſheet-lead upon the place.

LEAKAGE, the ſtate of a veſſel that leaks, or lets water or other liquid ouze in or out.

LEAKAGE, in commerce, is an allowance of 12 *per cent.* in the cuſtoms, allowed to importers of wines for the waſte and damage it is ſuppoſed to have received in the paſſage: an allowance of two barrels in twenty-two is alſo made to the brewers of ale and beer, by the exciſe-office.

LEAOTUNG, the moſt northerly part of China, in Aſia.

LEAP, in muſic, is when the ſong does not proceed by conjoint degrees, as when between each note there is an interval of a third, fourth, fifth, *&c.*

LEAP-YEAR. See ASTRONOMY, p. 489.

LEARMOUTH, a market-town of Northumberland, ſituated forty eight miles north-weſt of Newcaſtle, and twelve ſouth-weſt of Berwick.

LEASING-MAKING, in Scots law, the uttering of words tending to excite diſcord between the King and his people; alſo called verbal ſedition.

LEATHER, the ſkin of ſeveral ſorts of beaſts dreſſed and prepared for the uſe of the various manufacturers, whoſe buſineſs it is to make them up. See TANNING.

Colouring of LEATHER.

To colour white leather. Hang the ſkins in chalk or lime-water, till they are grown ſupple, that the hair or wool may be ſtripped off; ſtretch them on tenters, or by means of lines, and ſmooth them over: then bruſh them over with alum-water very warm, and colour them with the colour you would have them, and dry them in the ſun, or in ſome warm houſe, and they will be uſeful on ſundry occaſions, without any further trouble.

To colour black leather the German way. Take of the bark of the elder two pounds, of the filings or ruſt of iron the ſame quantity; put them into two gallons of rain-water, and ſtop them up cloſe in a caſk or veſſel, and let them ſtand for the ſpace of two months: then add to that the liquid part of a pound of nut-galls, beaten to powder, and a quarter of a pound of copperas, heating them over the fire, and ſuffering them to ſtand 24 hours after; and then uſe the liquor with a bruſh till the ſkin has taken a fine black.

To colour leather a fair red. Firſt rub the leather well in alum-water, or alum it; boil ſtale urine, ſcum it till half of it is waſted: then put in an ounce of the fineſt lake, the like quantity of brazil in powder, one ounce of alum, and half an ounce of ſal-armoniac; mix them well, and keep them ſtirring over a gentle fire about two hours; and ſo uſe the liquid part, to colour or tinge the ſkins.

To colour leather of a curious French yellow. Take one part of chalk, and another of wood-aſhes, and make of them a good lye; then ſtrain out the fine liquor, and ſet it in a veſſel over the fire, and put into it turmeric in powder, and a little ſaffron; and let it ſimmer, till it becomes pretty thick; then ſet it a cooling, to be uſed as occaſion requires.

To make white leather blue. Take a quart of elderberries, ſtrain out the juice, and boil it with an ounce of powder of alum, and half an ounce of indigo, or ſmalt-blue, and bruſh over the leather with a fine bruſh dipped in it three times, ſuffering it to dry between whiles, and the buſineſs will be effected.

To colour Spaniſh leather, &c. Take that which the Dutch call pomplemelch, warm it, and rub the leather with it; then take of Venice tot appelen; and having pounded it ſmall, put a quantity of water to it, and let it ſoften over a gentle fire; then preſs out the water, and rub or waſh out the ſkin in it; repeating the ſame ſeveral times; and after that, take the fineſt ſhoemakers black, and rub the ſkin over with it, having in the melting added a little vitriol or copperas; and letting it dry, take gooſe or hog's greaſe, and with a woollen cloth rub the ſkin over for a good while, where there is a good fire to ſupple it, and afterwards rub it over with your hands, till it diſappear; or inſtead of greaſe, you may uſe linſeed or train-oil, and ſo in caſe of any other colour, according to the colours you deſign.

Dying of LEATHER.

A reddiſh colour. Firſt waſh the ſkins in water, and wring them out well, and afterwards wet them with a ſolution of tartar and bay-ſalt in fair water, and wring them out again; then to the former diſſolution add aſhes of crab-ſhells, and rub the ſkins very well with this: afterwards, waſh them in common water, and wring them out; then waſh them with tincture of madder in the ſolution of tartar and alum and the crab-ſhell aſhes: and if they prove not red enough after all, waſh them with the tincture of brazil.

A pure yellow. Take of fine aloes two ounces, of linſeed-oil four pounds; diſſolve or melt them; then ſtrain the liquor, and beſmear the ſkins with it, and being dry varniſh them over.

An orange. Boil fuftic-berries in alum-water: but for a deep orange, ufe turmeric-root.

Blue. Boil elder-berries, or dwarf-elder, in water; then fmear or wafh the fkins with it; wring them out; then boil the berries as before in a folution of alum-water, and wet the fkins in the fame water once or twice; dry them, and they will be very blue.

A pure fky-colour. For each fkin take indigo one ounce; put it into boiling water, let it ftand one night; then warm it a little, and with a brufh-pencil befmear the fkin twice over.

Purple. Diffolve roch-alum in warm water, wet the fkins with it, dry them; then boil rafped brazil well in water; let it ftand to cool: do this three times, and afterwards rub the dye over the fkins with your hand; and when they are dry, polifh them.

Green. Take fap-green and alum-water, of each a fufficient quantity; mix and boil them a little; if you would have the colour darker, add a little indigo.

Proceffes for dying LEATHER Red *and* Yellow, *as practifed in* Turkey; *with directions for preparing and tanning the fkins, as communicated by Mr* Philippo, *a native of* Armenia, *who received from the Society for the Encouragement of Arts,* &c. *one hundred pounds, and alfo the gold medal of the Society, as a reward for difcovering this fecret.*

1. *Firft preparation of the Skins, both for Red and Yellow Leather, by dreffing them in lime.* Let the fkins, dried with the hair on, be firft laid to foak in clean water for three days; let them then be broken over the flefh fide, put into frefh water for two days longer, and afterwards hung up to drain half an hour. Let them now be broken again on the flefh fide, limed in cold lime on the fame fide, and doubled together with the grain fide outward. In this ftate they muft be hung up within doors over a frame for five or fix days, till the hair be loofe; which muft be then taken off, and the fkins returned into the lime-pit, for about three weeks. Take them out, and let them be well worked flefh and grain, every fixth or feventh day during that time: after which, let them be wafhed ten times in clear water, changing the water at each wafhing. They are next to be prepared in drench, as below mentioned.

2. *Second preparation of the Skins for both the Red and Yellow Dyes by drenching.* After fqueezing the water out of the fkins, put them into a mixture of bran and water, warm as new milk, in the following proportions, *viz.* about three pounds of bran for five fkins, and water fufficient to make the mixture moderately fluid, which will be about a gallon to each pound of bran. In this drench let the fkins lie three days; at the end of which time they muft be well worked, and afterwards returned into the drench two days longer. They muft then be taken out and rubbed between the hands; the water fqueezed from them, and the bran fcraped off clear from both fides of the fkins. After this they muft be again wafhed ten times in clear water, and the water fqueezed out of them.

Thus far the preparatory procefs of all the fkins, whether intended to be dyed red or yellow, is the fame; but afterwards thofe which are to be dyed red, muft be treated as follows.

3. *Preparation in honey and bran of the fkins that are to be dyed red.* Mix one pound of honey with three pints of luke-warm water, and ftirr them together till the honey is diffolved. Then add two double handfuls of bran; and taking four fkins (for which the above quantity of the mixture will be fufficient) work them well in it one after another. Afterwards fold up each fkin feparately into a round form, with the flefh fide inwards, and lay them in an earthen-pan, or other proper veffel; if in the fummer, by the fide of each other; but in the winter, on the top of each other. Place the veffel in a floping pofition, fo that fuch part of the fluid as may fpontaneoufly drain from the fkins, may drain from them. An acid fermentation will then rife in the liquor, and the fkins will fwell confiderably. In this ftate they muft continue for feven or eight days; but the moifture that drains from them, muft be poured off, once or twice a-day, as occafion may require. After this a further preparation in falt is neceffary; and which muft be performed in the following manner.

4. *Preparation in falt, of the fkins to be dyed red.* After the fkins have been fermented in the honey and bran, as abovementioned, let them be taken out of that mixture on the eighth or ninth day, and well rubbed with dry common fea-falt, in the proportion of about half a pound to each fkin; the falt muft be well rubbed and worked with them. This will make them contract again, and part with a further confiderable quantity of moifture; which muft be fqueezed out by drawing each fkin feparately through the hands. They muft next be fcraped clean on both fides from the bran, fuperfluous falt, and moifture that may adhere to them. After which, dry falt muft be ftrewed over the grain fide, and well rubbed in with the hand. They are then to be doubled with the flefh fide outwards, lengthways from neck to tail, and a little more dry falt muft be thinly ftrewed over the flefh fide, and rubbed in; for the two laft operations about a pound and a half of falt will be fufficient for each fkin. They muft then be put, thus folded on each other, between two clean boards, placed floping, breadthways; and a heavy weight laid on the upper board, in order gradually to prefs out what moifture they will thus part with. In this ftate of preffure, they muft be continued two days or longer, till it is convenient to dye them, for which they will then be duely prepared.

5. *Preparation of the Red Dye, in a proper proportion for four fkins.* Put eight gallons of water into a copper, with feven ounces of fhenan *, tied up in a linen bag. Light

* Shenan is a drug much ufed by dyers in the Eaft; and may eafily be procured at any of the ports of Syria and Africa, in the Levant. It is the Eaftern-jointed cali, called by botanifts felicornia; and grows in great plenty in thofe and other parts of the Eaft. There is a leffer fpecies of the felicornia on our coaft, which, from its great affinity with the fhenan, might be prefumed to have the fame qualities. On fome trials, however, it has not appeared to anfwer the intention

Light a fire under a copper, and when the water has boiled about a quarter of an hour, take out the bag of ſhenan, and put into the boiling fluid or lixivium, 1ſt, two drams of alum; 2dly, two drams of pomegranate bark; 3dly, three quarters of an ounce of turmeric; 4thly, three ounces of cochineal; 5thly, two ounces of loaf-ſugar. Let the whole mixture boil about ſix minutes, then cover the fire, and take out a quart of liquor, putting it into a flat earthen pan; and when it is as cold as new milk, take one ſkin, folded lengthways, the grain ſide outwards, and dip it in the liquor, rubbing it gently with the hands. Then taking out the ſkin, hang it up to drain, and throw away the ſuperfluous dye. Proceed in the ſame manner with the remaining three ſkins; repeating the operation on each ſkin ſeparately, eight times, ſqueezing the ſkins by drawing them through the hands before each freſh dipping. Lay them now on one ſide of a large pan, ſet ſloping, to drain off as much of the moiſture as will run from them without preſſure, for about two hours, or till they are cold; then tan them as below directed.

6. *Tanning the Red Skins.* Powder four ounces of the beſt white galls in a marble mortar, ſifting it through a fine ſieve. Mix the powder with about three quarts of water, and work the ſkins well in this mixture for half an hour or more, folding up the ſkins four-fold. Let them lie in this tan twenty-four hours; when they muſt be worked again as before; then taken out, ſcraped clean on both ſides from the firſt galls, and put into a like quantity of freſh galls and water. In this freſh mixture they muſt be again well worked for three quarters of an hour; then folded up as before, and left in the freſh tan for three days. On the fourth day they muſt be taken out, waſhed clean from the galls, in ſeven or eight freſh quantities of water, and then hung up to dry.

7. *Manner of dreſſing the ſkins after they are tanned.* When the ſkins have been treated as above, and are very near dry, they ſhould be ſcraped with the proper inſtrument or ſcraper on the fleſh ſide, to reduce them to a proper degree of thickneſs. They are then to be laid on a ſmooth board, and glazed by rubbing them with a ſmooth glaſs. After which they muſt be oiled, by rubbing them with olive oil, by means of a linen rag, in the proportion of one ounce and an half of oil for four ſkins: then they are to be grained on a graining board, lengthways, breadthways, and cornerways, or from corner to corner.

8. *Preparation with Galls, for the Skins to be dyed yellow.* After the four ſkins are taken out of the drench of bran, and clean waſhed as before directed in the ſecond article, they muſt be very well worked, half an hour or more, in a mixture of a pound and a half of the beſt white galls, finely powdered, with two quarts of clean water. The ſkins are then to be ſeparately doubled lengthways; rolled up with the fleſh ſide outwards, laid in the mixture, and cloſe preſſed down on each other, in which ſtate they muſt continue two whole days. On the third day let them be again worked in the tan; and afterwards ſcraped clean from the galls, with an ivory or braſs inſtrument (for no iron muſt touch them.) They muſt then be put into a freſh tan, made of two pounds of galls finely powdered, with about three quarts of water, and well worked therein fifteen times. After this they muſt be doubled, rolled up as before, and laid in the ſecond tan for three days. On the third day a quarter of a pound of white ſea-ſalt muſt be worked into each ſkin; and the ſkins doubled up as before, and returned into the tan, till the day following, when they are to be taken out, and well waſhed ſix times in cold water; and four times in water lukewarm. The water muſt be then well ſqueezed out, by laying the ſkins under preſſure, for about half an hour, between two boards, with a weight of about two or three hundred pounds laid upon the uppermoſt board, when they will be ready for the dye.

9. *Preparation of the Yellow Dye, in the proper proportion for four ſkins.* Mix ſix ounces of caſſiari gehira*, or dgehira, or the berries of the eaſtern rhamnus, with the ſame quantity of alum, and pound them together till they be fine, in a marble or braſs mortar, with a braſs peſtle. Then dividing the materials, thus powdered, into three equal parts of four ounces each, put one of thoſe three parts into about a pint and a half of water, in a china or earthern veſſel; and ſtir the mixture together. Let the fluid ſtand to cool, till it will not ſcald the hand. Then ſpreading one of the ſkins flat on a table, in a warm room, with the grain ſide uppermoſt, pour a fourth part of the tinging liquor, prepared as above directed, over the upper or grain ſide, ſpreading it equally over the ſkin with the hand, and rubbing it well in. Afterwards do the like with the other three ſkins, for which the mixture firſt made will be ſufficient.

This operation muſt be repeated twice more on each ſkin ſeparately, with the remaining eight ounces of the powder of the berries, and alum, with the abovementioned due proportions of hot water, put to them as before directed.

The ſkins, when dyed, are to be hung up on a wooden frame, without being folded, with the grain ſide outwards, about three quarters of an hour to drain, when they muſt be carried to a river or ſtream of running water, and well waſhed therein ſix times or more. After this, they muſt be put under preſſure for about an hour, till the water be well ſqueezed out; afterwards the ſkins muſt be hung up to dry in a warm room.

This being done, the ſkins are to be dreſſed and grained as before directed for thoſe dyed red; except the oiling, which muſt be omitted.

Gilding

tention of the ſhenan; but it will be prudent to purſue the examination of this further, as ſome unknown circumſtances in the collecting or uſing the Engliſh ſelicornia might occaſion the miſcarriage. But be this as it may, the Eaſtern ſhenan may, at all events, be eaſily procured in any quantity, at a very trifling expence, by any of the captains of Turkey ſhips, at Aleppo, Smyrna, *&c.*

* The caſſiari gehira is the berries of an Eaſtern rhamnus, or buckthorn tree, and may be had at Aleppo, and other parts of the Levant, at a ſmall price. The common Avignon, or yellow berries, may be ſubſtituted, but not with ſo good an effect; the caſſiari gehira being a ſtronger and brighter yellow dye, both for this uſe, and alſo that of colouring paper hangings, *&c.*

Gilding of LEATHER. Take glair of the whites of eggs, or gum-water, and with a bruſh rub over the leather with either of them; then lay on the gold or ſilver, and letting them dry, burniſh them. See the articles GILDING and BURNISHING.

To dreſs or cover leather with ſilver or gold. Take brown red, grind or move it on a ſtone with a muller, adding water and chalk; and when the latter is diſſolved, rub, or lighty dawb the leather over with it, till it looks a little whitiſh; and then lay on the leaf, ſilver or gold, before the leather is quite dry, laying the leaves a little over each other, that there may not be the leaſt part uncovered; and when they have well cloſed with the leather, and are ſufficiently dried on, and hardened, rub them over with an ivory poliſher, or the fore-tooth of a horſe.

LEAVEN, a piece of ſour dough, uſed to ferment and render light a much larger quantity of dough or paſte.

LECHEA, in botany, a genus of the triandria trigynia claſs. The calix conſiſts of three leaves, and the corolla of three linear petals; and the capſules are three, with three valves, and one ſeed. There are two ſpecies, both natives of Canada.

LECTICA, in Roman antiquity, a vehicle in which people were carried in a reclining poſture.

LECTISTERNIUM, a religious feaſt or banquet of the ancient Romans. In times of public danger or calamity, or of thankſgiving for ſome happy event, the republic ordered ſolemn feaſts to be made for the gods; and this ſolemnity was called lectiſternium, becauſe on this occaſion they ſpread tables, and placed beds around them, on which their heavenly gueſts were to lie and eat.

LECTURERS, in England, are an order of preachers in pariſh-churches, diſtinct from the rector or vicar. They are choſen by the veſtry, or chief inhabitants of the pariſh, and are uſually the afternoon preachers.

LEDBURY, a market-town of Hereford-ſhire, thirteen miles eaſt of Hereford.

LEDGER, the principal book wherein merchants enter their accounts. See BOOK-KEEPING.

LEDUM, the MARSH-CISTUS, in botany, a genus of the decandria monogynia claſs. The calix conſiſts of five ſegments, and the corolla of five plain petals; and the capſule has five cells, opening at the baſe. There is but one ſpecies, a native of the northern parts of Europe.

LEE, in the ſea-language, a word of various ſignifications; though it is generally underſtood to mean the part oppoſite to the wind. Thus *lee-ſhore*, is that ſhore againſt which the wind blows. *Lee-latch*, or have a care of the lee-latch, is, take care that the ſhip do not go to the leeward, or too near the ſhore. *A lee the helm*, put it to the leeward ſide of the ſhip. *To lie by the lee*, or to come up to the lee, is to bring the ſhip ſo, that all her ſails may lie flat againſt her maſts and ſhrouds, and that the wind may come right upon her broad ſide.

LEE-WAY, is the angle that the rhumbline, upon which the ſhip endeavours to ſail, makes with the rhumb upon which ſhe really ſails. See NAVIGATION.

LEECH, in zoology. See HIRUDO.

LEEDS, a large market town, in the weſt riding of Yorkſhire, ſituated on the river Aire, twenty-miles ſouth-weſt of York; it has a very great woolen trade.

LEEK. See ALLIUM.

LEERDAM, a town in the province of Holland, ſeventeen miles north eaſt of Dort: E. long. 5°, N. lat. 51° 50′.

LEERWICK, a town of Scotland, in Mainland, one of the iſlands of Shetland, in the county of Orkney: W. long. 30′, N. lat. 61° 20′.

LEES, are the more groſs and ponderous parts of liquors, which, being ſeparated by fermentation, fall to the bottom.

LEET, a little court held within a manor, and called the king's court, on account that its authority to puniſh offences originally belonged to the Crown, from whence it is derived to inferior perſons.

LEEWARD, at ſea, the ſide oppoſite to that on which the wind blows.

LEEWARD-ISLANDS, in America, a name given to the Caribbees.

LEG, in anatomy. See ANATOMY, Part I. and II. *&c.*

LEGACY, in Scots law, a donation by one perſon to another, to be paid by the giver's executor after his death. See LAW, Tit. xxviii. 3.

LEGATEE, in Scots law, the perſon to whom a legacy is provided.

LEGATE, a cardinal or biſhop, whom the pope ſends as his ambaſſador to ſovereign princes.

LEGATUS, in roman antiquity, a military officer who commanded as deputy of the chief general.

LEGEND, any idle or ridiculous ſtory told by the Romaniſts concerning their ſaints, and other perſons, in order to ſupport the credit of their religion.

The legend was originally a book uſed in the old Romiſh churches, containing the leſſons to be read at divine ſervice; hence the lives of the ſaints and martyrs came to be called legends, becauſe chapters were read out of them at matins, and in the refectories of religious houſes. Among theſe the golden legend, which is a collection of the lives of the ſaints, was received by the church with great applauſe, which it maintained for two hundred years; though it is ſo full of ridiculous and romantic ſtories, that the Romaniſts themſelves are now aſhamed of it.

LEGER-LINE, in muſic, one added to the ſtaff of five lines, when the aſcending or deſcending notes run very high or low: there are ſometimes many of theſe lines both above and below the ſtaff, to the number of four or five.

LEGGIARDO, or LEGGIARDAMEMTE, in muſic, ſignifies to play or ſing in a lively, briſk, and gay manner.

LEGHORN, or LIVORNO, a port town of Italy, in the duchy of Tuſcany, ſituated on the Tuſcan ſea, forty miles weſt of Florence: E. long. 11°, N. lat. 43° 30′.

LEGION, in Roman antiquity, a body of foot which conſiſted of ten cohorts.

The exact number contained in a legion, was fixed by Romulus at three thouſand; though Plutarch aſ-

fures us, that after the reception of the Sabines into Rome, he encreafed it to fix thoufand. The common number afterwards, in the firft times of the free ftate, was four thoufand; but in the war with Hannibal, it arofe to five thoufand; and after this it is probable that it funk again to four thoufand, or four thoufand two hundred, which was the number in the time of Polybius.

LEGISLATOR, a law giver, or perfon who eftablifhes the polity and laws of a ftate. Such was Mofes, among the Jews; Lycurgus, among the Lacedæmonians, *&c.*

LEGITIMATION, an act whereby illegitimate children are rendered legitimate.

LEGITIME, in Scots law, that fhare of the moveable effects belonging to a hufband and wife, which upon the hufband's death falls to the children. See LAW, Tit. xxviii. 5.

LEGUME. See BOTANY, p. 637.

LEGUMINOUS, an appellation given to all plants whofe fruit is a legume.

LEICESTER, the county-town of Leicefterfhire. It fends two members to parliament. W. long. 1° 5′, and N. lat. 52° 40′.

LEININGEN, a town of Germany, feventeen miles fouth of Worms.

LEINSTER, a province of Ireland, the capital of which is Dublin.

LEIPSIC, a rich and populous city of Germany, in the circle of Upper Saxony and province of Mifnia: E. long. 12° 40′, N. lat. 51° 20′.

LEITH, a port-town of Scotland, about two miles north of Edinburgh.

LEMBURG, LEOPOLIS, a city of Poland, and capital of the province of Red Ruffia: E. long. 24°, N. lat. 49°.

LEMMA, in mathematics, a propofition which ferves previoufly to prepare the way for the more eafy apprehenfion of the demonftration of fome theorem, or conftruction of fome problem.

LEMNA, in botany, a genus of the monœcia diandria clafs. The calix of both male and female confifts of one leaf; neither of them have any corolla; the female has one ftylus, and the capfule confifts of one cell. There are four fpecies, three of which are natives of Britain, *viz.* the trifulca, or ivy-leaved duck's-meat; the minor, or leaft duck's meat; and the polyrhiza, or greater duck's-meat.

LEMNOS, an ifland of the Archipelago, fituated forty-miles fouth-weft of the entrance of the Hellefpont; E. lon. 26°, N. lat. 29°.

LEMON, in botany. See CITRUS.

LEMONADE, a liquor prepared of water, fugar, and lemon or citron juice: it is very cooling and grateful.

LEMUR, in zoology, a genus of quadrupeds belonging to the order of primates, the characters of which are thefe: There are four fore-teeth in the upper jaw, the intermediate ones being remote; and fix long, compreffed, parallel teeth in the under jaw; the dog-teeth are folitary, and the grinders are fomewhat labated. There are five fpecies, *viz.*

1. The tardigradus, is a fmall animal, about eight inches long; and is found in Ceylon. The head is roundifh, with a prominent nofe; the legs are long and thick; and the feet refemble thofe of a monkey; the eyes are round, and near each other; the ears are long, and fituate very low on the head. The hair on the top of the head, the ears, the neck, the fhoulders, the back, the fides, and the outer parts of the thighs and legs, are of a reddifh afh-colour; there is a white line betwixt the ears; the under jaw, the throat, the breaft, and the belly, are mixed with white and an afh colour. It has no tail. This animal is of a very fingular conftruction. It is perhaps longer in proportion to its thicknefs than any other quadruped: But its natural hiftory is but imperfectly known.

2. The mongoz, is of a greyifh colour above, and white below; his body is about a foot and a half in length; and the tail is as long as the body. This animal is very troublefome when kept in a domeftic ftate. He takes every opportunity of efcaping, and flies to the woods in queft of fruits, and it is very difficult to catch him. He bites in a cruel manner thofe with whom he is leaft acquainted. He has a great averfion at cold and moifture. He lives upon bread and fruits. His motions are brifk and lively. He is a native of Madagafcar.

3. The macaco has a long tail, with about 30 alternate rings of black and white, and a barbed collar. He is about a foot and four inches long, and the tail is longer than the body. His general figure very much refembles that of a monkey, excepting the head, which is fomewhat triangular. The mocaco is a beautiful and elegant animal. Although his figure refembles the monkey, his difpofitions and manners are very different. He is gentle and inoffenfive in a domeftic ftate. In a natural ftate, he is fond of fociety: In the ifland of Madagafcar, troops of 30 or 40 of them are generally found together in the woods.

4. The catta has likewife a long tail, with black and white rings. This is a very gentle animal; it lives upon fruits and roots; its motion is flow; and it makes a placid murmuring noife like a cat. It is likewife a native of Madagafcar.

5. The volans, refembles a bat, being furnifhed with a ftrong membrane, like that animal, by which it is enabled to fly. It is a native of Afia; but its hiftory is not fufficiently known.

LEMURIA, a feftival of the ancient Romans, folemnized on the ninth of May, to pacify the manes of the dead, who were the lemures or phantoms that came in the night to torment the living.

LENA, a great river of Siberia running north from N. lat. 55° to 72°.

LENÆA, in antiquity, a feftival of Bacchus, firnamed Lenæus from a vine-prefs. Befides the ufual ceremonies at feafts facred to this god, it was remarkable for poetical contentions, and tragedies acted at this time.

LENS, in dioptrics, properly fignifies a fmall roundifh glafs, of the figure of a lentil; but is extended to any optic glafs, not very thick, which either collects the rays of light into a point, in their paffage through it, or

or difperfes them further apart, according to the laws of refraction. See OPTICS.

LENT, a folemn time of fafting in the Chriftian church, obferved as a time of humiliation before Eafter, the great feftival of our Saviour's refurrection.

Thofe of the Romifh church, and fome of the Proteftant communion, maintain, that it was always a faft of forty days, and, as fuch, of apoftolical inftitution. Others think it was only of ecclefiaftical inftitution, and that it was varioufly obferved in different churches, and grew by degrees from a faft of forty hours, to a faft of forty days. This is the fentiment of Morton, bifhop Taylor, du Maulin, Daillee, and others.

LENTISCUS, in botany. See PISTACIA.

LEO, in zoology. See FELIS.

LEO, in aftronomy. See ASTRONOMY, p. 467.

St LEO, a town and bifhop's fee of Italy, twenty miles north-weft of Urbino.

LEON, the capital of the province of Leon, in Spain, fituated on the river Efla: W. long. 6° 5', N. lat. 43°.

LEON is alfo the capital of the province of Nicaragua, in Mexico, fituated at the weft end of the Lake Nicaragua: W. long, 91°, N. lat. 11° 30'.

St LEONARD, a town of France, in the province of Guiennes, and territory of Limofin: E. long. 1° 45', N. lat. 45° 50'.

St. LEONHART, a town of Germany, in the circle of Auftria, and duchy of Carinthia: E. long. 15°, N. lat. 47°.

LEONTICE, in botany, a genus of the hexandria monogynia clafs. The corolla confifts of fix petals, and the nectarium of fix leaves inferted into the ungues of the corolla, and having an open limbus; and the calix has fix deciduous leaves. There are four fpecies, none of them natives of Britain.

LEONTINI, a town of Sicily, twenty miles north-weft of Syracufe.

LEONTODON, in botany, a genus of the fyngenefia polygamia æqualis clafs. The receptacle is naked; the calix is caliculated; the pappus is fimple; and the flofculi are in a fimple feries. There are nine fpecies, three of them natives of Britain, *viz.* the taraxacum, or dandelion; the hifpidum, or rough dandelion; and the autumnale, or yellow devil's-bit. The root of the taraxacum is efteemed a good cathartic.

LEONURUS, LION'S TAIL, in botany, a genus of the didynamia gymnofpermia clafs. The antheræ are interfperfed with fhining glands. There are five fpecies, only one of them, *viz.* the cardiaca, or mother-wort, is a native of Britain.

LEOPARD. See FELIS.

LEOPARD'S BANE, in botany. See DORONICUM.

LEPANTO, a port-town of European Turky, eighty miles weft of the ifthmus of Corinth; whence the gulph of Lepanto takes its name.

LEPASTRUM, in natural hiftory, a genus of felenitæ, compofed of plates difpofed in the form of a radiated ftar.

LEPIDIUM, in botany, a genus of the tetradynamia filiculofa clafs. The pod is emarginated, cordated, and contains many feeds. There are 17 fpecies, three of them natives of Britain, *viz.* the latifolium, or dittander: the ruderale, narrow-leaved wild crefs, or dittander; and the petræum, or mountain dittander.

LEPIDOPTERA, in zoology, an order of infects, with four wings, which are covered with imbricated fquamulæ. See NATURAL HISTORY.

LEPIUM, in natural hiftory, a genus of foffils of the harder gypfum, compofed of very fmall particles, and of a lefs glittering hue.

There is only one fpecies of this genus, being one of the leaft valuable and moft impure of the clafs of gypfums. It is of an extremely rude, irregular, coarfe and unequal ftructure; a little foft to the touch, of a very dull appearance, and of different degrees of a greyifh white. It is burnt in plaifter for the coarfer works; it calcines very flowly and unequally, and makes but a very coarfe and ordinary plaifter.

LEPROSY, a foul cutaneous difeafe, appearing in dry, white, thin, fcurfy fcabs, either on the whole body, or only fome part of it, and ufually attended with a violent itching and other pains. See MEDICINE.

LEPTODECORHOMBES, in natural hiftory, a genus of foffils of the order of the felenitæ; confifting of ten planes, each fo nearly equal to that oppofite to it as very much to approach to a decahedral parallelopiped, though never truly or regularly fo.

Of this genus there are only five known fpecies. 1. A thin, fine, pellucid, and flender ftreaked one, with tranfverfe ftriæ, found in confiderable quantities in the ftrata of clay in moft parts of England, particularly near Heddington in Oxfordfhire. 2. A thin, dull-looking opake, and flender ftreaked one, more fcarce than the former, and found principally in Leicefterfhire and Staffordfhire. 3. A thin fine ftreaked one, with longitudinal ftriæ, found in the clay-pits at Richmond, and generally lying at great depths. This has often on its top and bottom a very elegant fmaller rhomboide, defcribed by four regular lines. 4. A rough kind, with thick tranfverfe ftriæ, and a fcabrous furface, very common in Leicefterfhire and Yorkfhire. And, 5. a very fhort kind, with thick plates, common in the clay-pits of Northamptonfhire and Yorkfhire.

LEPTOPOLYGINGLIMI, in Natural Hiftory, a genus of foffil fhells, diftinguifhed by a number of minute teeth at the cardo; whereof we find great numbers at Harwick cliff, and in the marle-pits of Suffex.

LEPTURA, in zoology, a genus of infects belonging to the order of coleoptera, the characters of which are thefe:—The feelers are briftly; the elytra are attenuated towards the apex; and the thorax is fomewhat cylindrical. There are 25 fpecies, principally diftinguifhed by their colour.

LEPUS, in zoology, a genus of quadrupeds belonging to the order of glires. The characters are thefe: they have two fore-teeth in each jaw; thofe in the upper jaw are double, the interior ones being fmalleft. There are four fpecies, *viz.*

1. The timidus, or hare, has a fhort tail; the points of the ears are black; the upper-lip is divided up to the

the noſtrils; the length of the body is generally about a foot and a half; and the colour of the hair is reddiſh, interſperſed with white. The hare is naturally a timid animal. He ſleeps in his form, or ſeat, during the day, and feeds, copulates, *&c.* in the night. In a moon-light evening, a number of them are ſometimes ſeen ſporting together, leaping and purſuing each other: But the leaſt motion, the falling of a leaf, alarms them; and then they all run off ſeparately, each taking a different route. They are extremely ſwift in their motion, which is a kind of gallop, or a ſucceſſion of quick leaps. When purſued, they always take to the higher grounds: as their fore-feet are much ſhorter than the hind ones, they run with more eaſe up hill than down hill. The hare is endowed with all thoſe inſtincts which are neceſſary for his own preſervation. In winter he chuſes a form expoſed to the ſouth, and in ſummer to the north. He conceals himſelf among vegetables of the ſame colour with himſelf. Mr Fouilloux ſays, that he obſerved a hare, as ſoon as he heard the ſound of the horn, or the noiſe of the dogs, although at a mile's diſtance, riſe from her ſeat, ſwim acroſs a rivulet, then lie down among the ruſhes, and by this means evade the ſcent of the dogs. After being chaſed for a couple of hours, a hare will ſometimes puſh another from his form, and lie down in it himſelf. When hard preſſed, the hare will mingle with a flock of ſheep, run up an old wall and conceal himſelf among the graſs on the top of it, or croſs a river ſeveral times at ſmall diſtances. He never runs againſt the wind, or ſtraight forward; but conſtantly doubles about, in order to make the dogs loſe their ſcent.

It is remarkable, that the hare, although ever ſo frequently purſued by the dogs, ſeldom leaves the place where ſhe was brought forth, or even the form in which ſhe uſually ſits. It is common to find them in the ſame place next day, after being long and keenly chaſed the day before. The females are more groſs than the males, and have leſs ſtrength and agility; they are likewiſe more timid, and never allow the dogs to approach ſo near their form before riſing as the males. They likewiſe practiſe more arts, and double more frequently, than the males.

The hare is diffuſed almoſt over every climate; and, notwithſtanding they are every where hunted, their ſpecies never diminiſhes. They are in a condition of propagating the firſt year of their lives; the females go with young about 30 days, and produce four or five at a time; and as ſoon as they have brought forth, they again admit the embraces of the male; ſo that they may be ſaid to be always pregnant. The eyes of the young are open at birth; the mother ſuckles them about 20 days, after which they ſeparate from her and procure their own food. The young never go far from the place where they were brought forth; but ſtill they live ſolitary, and make forms about thirty paces diſtant from each other: Thus, if a young hare be found any where, you may almoſt be certain of finding ſeveral others within a very ſmall diſtance. The hare is not ſo ſavage as his manners would indicate. He is gentle, and ſuſceptible of a kind of education. He is pretty eaſily tamed, and will even ſhow a kind of attachment to the people of the houſe: But ſtill this attachment is not ſo ſtrong or laſting as to engage him to become altogether domeſtic; for although taken when very young, and brought up in the houſe, he no ſooner arrives at a certain age, than he takes the firſt opportunity of recovering his liberty and flying to the fields. The hare lives about ſeven or eight years. He feeds upon graſs, and other vegetables. His fleſh is excellent food. See Plate CIII. fig. 2.

2. The cuniculus, or rabbit, has a very ſhort tail, and naked ears. The rabbit, though it has a great reſemblance to the hare, is very different in his manners; and they have ſuch a rooted antipathy to one another, that no art can engage them to have any ſexual intercourſe. The fecundity of the rabbit is ſtill greater than that of the hare; they multiply ſo prodigiouſly in ſome countries, that the product of the fields is hardly ſufficient to maintain them. They devour herbage of all kinds, roots, grain, fruits, *&c.* They are in a condition for producing at the age of ſix months; like the hare, the female is almoſt conſtantly in ſeaſon; ſhe goes with young about 30 days, and brings forth from four to eight at a litter. A few days before littering, ſhe digs a new hole in the earth, not in a ſtraight line, but in a zigzag form; the bottom of the hole ſhe enlarges every way; ſhe the npulls off a great quantity of hair from her belly, of which ſhe makes a kind of bed for her young. During the two firſt days after birth, ſhe never leaves them, but when preſſed with hunger, and and then ſhe eats quickly and returns: In this manner ſhe ſuckles and attends her young for ſix weeks. All this time, both the hole and the young are concealed from the male; ſometimes when the female goes out, in order to deceive the male, ſhe fills up the mouth of the hole with earth mixed with her own urine. But when the young ones begin to come to the mouth of the hole, and to eat ſuch herbs as the mother brings to them, the father ſeems to know them; he takes them betwixt his paws, ſmooths their hair, and careſſes them with great fondneſs. The rabbit is ſuppoſed not to be a native of the northern parts of Europe, but to have been originally brought from Greece and Spain. The rabbit lives about ſeven years, and his fleſh is good. Their colour is various, ſome of them being red, others white, but the moſt general colour is grey. See Plate CIII. fig. 3.

3. The capenſis, has a tail about the length of his head, and red legs. It is a native of the Cape of Good Hope.

4. The braſilienſis has no tail. It is found in South America.

LEPUS, in aſtronomy. See ASTRONOMY, p. 487.

LERIA, a city and biſhop's ſee of Portugal: W. long. 9° 15′, and N. lat. 39° 30′.

LERIDA, a city and biſhop's ſee of Catalonia in Spain: E. long. 5′, N. lat. 41° 20′.

LERINS, two iſlands on the coaſt of Provence, five or ſix miles ſouth of Antibes, called St. Margaret and St. Honorat.

LERNEA, the SEA-HARE, in zoology, a ſea-inſect of the order of the gymnarthria, the body of which is of an oblong cylindric figure, and is perforated in the forehead; the tentacula reſemble ears. See GYMNARTHRIA.

LE ROY LE VEUT, the king's aſſent to public bills. See the articles BILL, STATUTE, and PARLIAMENT.

LESBOS, or METELIN, an iſland of the Archipelago, ſixty miles north-weſt of Smyrna. Its chief town is Caſtro.

LESCAR, a city and biſhop's ſee of France, forty miles eaſt of Bayonne.

LESCARD, a borough-town of Cornwal, fifteen miles weſt of Launceſton, which ſends two members to parliament.

LESSINES, a town of the Auſtrian Netherlands, fourteen miles north of Mons.

LESSONS, among eccleſiaſtical writers, portions of the Holy Scriptures, read in Chriſtian churches, at the time of divine ſervice.

LESTWITHIEL, a borough-town of Cornwal, twenty three miles ſouth-weſt of Launceſton, which ſends two members to parliament.

LETHARGY, in medicine. See MEDICINE.

LETHE, in the ancient mythology, one of the rivers of hell, ſignifying oblivion or forgetfulneſs; its waters having, according to poetical fiction, the peculiar quality of making thoſe who drank of them forget every thing that was paſt.

LETRIM, or LEITRIM, a county of Ireland, in the province of Connaught; bounded by Fermanagh on the north, by Cavan on the eaſt, by Roſcommon on the ſouth, and by Sligo on the weſt.

LETTER, a character uſed to expreſs one of the ſimple ſounds of the voice; and as the different ſimple ſounds are expreſſed by different letters, theſe, by being differently compounded, become the viſible ſigns or characters of all the modulations and mixtures of ſounds uſed to expreſs our ideas in a regular language.

LETTER *of attorney*, in law, is a writing by which one perſon authoriſes another to do ſome lawful act in his ſtead; as, to give ſeiſin of lands, to receive debts, ſue a third perſon, *&c.*

The nature of this inſtrument is to transfer to the perſon to whom it is given, the whole power of the maker, to enable him to accompliſh the act intended to be performed. It is either general or ſpecial; and ſometimes it is made revocable, which is when a bare authority is only given; and ſometimes it is irrevocable, as where debts, *&c.* are aſſigned from one perſon to another. It is generally held, that the power granted to the attorney muſt be ſtrictly purſued; and that where it is made to three perſons, two cannot execute it. In moſt caſes, the power given by a letter of attorney determines upon the death of the perſon who gave it. No letter of attorney made by any ſeaman, *&c.* in any ſhip of war, or having letters of marque, or by their executors, *&c.* in order to impower any perſon to receive any ſhare of prizes, or bounty-money, ſhall be valid, unleſs the ſame be made revocable, and for the uſe of ſuch ſeamen, and be ſigned and executed before, and atteſted by, the captain and one other of the ſigning officers of the ſhip, or the mayor or chief magiſtrate of ſome corporation.

LETTER *of mart*, or *marque*, a letter granted to one of the king's ſubjects, under the privy ſeal, impowering him to make repriſals for what was formerly taken from him by the ſubjects of another ſtate contrary to the law of mart. See the article MARQUE.

LETTERS-PATENT, are writings ſealed with the great ſeal; ſo called, becauſe they are open, with the ſeal affixed to them. Theſe are granted to authoriſe a man to do or enjoy what of himſelf he could not do.

LETTUCE, in botany. See LACTUCA.

LEVANT, a name given to the eaſt part of the Mediterranean ſea, bounded by Natolia or the leſſer Aſia on the north, by Syria and Paleſtine on the eaſt, by Egypt and Barca on the ſouth, and by the iſland of Candia and the other part of the Mediterranean on the weſt.

LEVATOR, in anatomy, a name given to ſeveral muſcles. See ANATOMY, Part II.

LEUCADENDRON, in botany, a genus of the tetrandria monogynia claſs. The floſculi have two petals, one of them being divided into ſegments; the receptacle is ſomewhat hairy; it has no proper calix; and the antheræ are joined together. There are 15 ſpecies, none of them natives of Britain.

LEUCOIUM, the GREAT SNOW-DROP, in botany, a genus of the hexandria monogynia claſs. The corolla is bell-ſhaped, and divided into ſix ſegments; and the ſtigma is ſimple. There are three ſpecies, none of them natives of Britain.

LEUCOMA, in ſurgery, a diſtemper of the eye, otherwiſe called albugo. See ALBUGO and MEDICINE.

LEUCOPHLEGMATIA, in medicine, a kind of dropſy, otherwiſe called anaſarca. See ANASARCA and MEDICINE.

LEVEL, an inſtrument wherewith to draw a line parallel to the horizon, by means of which the true level, or the difference of aſcent or deſcent between ſeveral places, may be found for conveying water, draining fens, *&c.*

There are ſeveral inſtruments of different contrivance and matter, invented for the perfection of levelling; all of which, for the practice, may be reduced to thoſe that follow.

Air LEVEL, that which ſhews the line of level by means of a bubble or air incloſed with ſome liquor in a glaſs-tube of an indeterminate length and thickneſs, whoſe two ends are hermetically ſealed. When the bubble fixes itſelf at a certain mark, made exactly in the middle of the tube, the plane or ruler wherein it is fixed is level. When it is not level, the bubble will riſe to one end. This glaſs tube may be ſet in another of braſs, having an aperture in the middle, whence the buble of air may be obſerved. The liquor wherewith the tube is filled, is oil of tartar, or aqua ſecunda; thoſe not being liable to freeze as common water, nor to rarefaction and condenſation, as ſpirit of wine is. There is one of theſe inſtruments with ſights, being an improvement upon that laſt deſcribed, which, by the addition of more apparatus, becomes more commodious and exact. It conſiſts of an air level, (ſee Plate CIV. fig. 1.) n° 1. about eight inches long, and ſeven or eight lines in diameter, ſet in a braſs-tube.

2. with an aperture in the middle, C. The tubes are carried in a ſtrong ſtraight ruler, a foot long; at whoſe ends are fixed two ſights, 3, 3, exactly perpendicular to the tubes, and of an equal height, having a ſquare hole, formed by two fillets of braſs croſſing each other at right angles; in the middle whereof is drilled a very little hole, through which a point on a level with the inſtrument is deſcried. The braſs-tube is faſtened on the ruler by means of two ſcrews, one whereof, marked 4, ſerves to raiſe or depreſs the tube at pleaſure, for bringing it towards a level. The top of the ball and ſocket is rivetted to a little ruler that ſprings, one end whereof is faſtened with ſcrews to the great ruler, and at the other end has a ſcrew, 5, ſerving to raiſe and depreſs the inſtrument when nearly level.

This inſtrument, however, is yet leſs commodious than the following one; becauſe though the holes be ever ſo ſmall, yet they will ſtill take in too great a ſpace to determine the point of level preciſely.

This inſtrument conſiſts of an air level, with teleſcope ſights: this level (*ibid.* n° 2.) is like the laſt, with this difference, that inſtead of plain ſights, it carries a teleſcope to determine exactly a point of level at a good diſtance. The teleſcope is a little braſs tube, about fifteen inches long, faſtened on the ſame ruler as the level. At the end of the tube of the teleſcope, marked 1, enters the little tube 1, carrying the eye-glaſs and an hair horizontally placed in the focus of the object-glaſs, 2; which little tube may be drawn out, or puſhed into the great one, for adjuſting the teleſcope to different ſights: at the other end of the teleſcope is placed the object-glaſs. The ſcrew 3, is for raiſing or lowering the little fork, for carrying the hair, and making it agree with the bubble of air, when the inſtrument is level; and the ſcrew 4, is for making the bubble of air, D or E, agree with the teleſcope: the whole is fitted to a ball and ſocket. M Huygens is ſaid to be the firſt inventor of this level, which has this advantage, that it may be inverted by turning the ruler and teleſcope half round; and if then the hair cut the ſame point that it did before, the operation is juſt.

It may be obſerved, that one may add a teleſcope to any kind of level, by applying it upon or parallel to the baſe or ruler, when there is occaſion to take the level of remote objects.

Dr Deſaguliers contrived an inſtrument, by which the difference of level of two places, which could not be taken in leſs than four or five days with the beſt teleſcope-levels, may be taken in as few hours. The inſtrument is as follows: to the ball C (*ibid.* n° 3.) is joined a recurve tube B A, with a very fine bore, and a ſmall bubble at top, A, whoſe upper part is open. It is evident from the make of this inſtrument, that if it be inclined in carrying, no prejudice will be done to the liquor, which will always be right both in the ball and tube when the inſtrument is ſet upright. If the air at C, be ſo expanded with heat, as to drive the liquor to the top of the tube, the cavity A will receive the liquor, which will come down again and ſettle at D, or near it, according to the level of the place where the inſtrument is, as ſoon as the air at C returns to the ſame temperament as to heat and cold. To preſerve the ſame degree of heat, when the different obſervations are made, the machine is fixed in a tin veſſel E F, filled with water up to *g h*, above the ball, and a very ſenſible thermometer has alſo its ball under water, than one may obſerve the liquor at D, in each experiment, when the thermometer ſtands at the ſame height as before. The water is poured out when the inſtrument is carried, which one may do conveniently by means of the wooden frame, which is ſet upright by the three ſcrews S, S, S, *ibid.* n° 4. and a line and plummet P P, n° 5. At the back part of the wooden frame, from the piece at top K, hangs the plummet P, over a braſs point at N; M *m* are brackets, to make the upright board K N continue at right angles with the horizontal one at N. N° 6. repreſents a front view of the machine, ſuppoſing the fore part of the tin-veſſel tranſparent; and here the braſs-ſocket of the recurve tube, into which the ball is ſcrewed, has two wings at I I, fixed to the bottom, that the ball may not break the tube by its endeavour to emerge when the water is poured in as high as *g h*.

After the Dr had contrived this machine, he conſidered, that as the tube is of a very ſmall bore, if the liquor ſhould riſe into the ball at A, n° 3. in carrying the inſtrument from one place to another, ſome of it would adhere to the ſides or the ball A, and upon its deſcent in making the experiment, ſo much might be left behind, that the liquor would not be high enough at D, to ſhew the difference of the level: therefore, to prevent that inconveniency, he contrived a blank ſcrew, to ſhut up the hole at A, as ſoon as one experiment is made, that in carrying the machine, the air in A may balance that in C, ſo that the liquor ſhall not run up and down the tube, whatever degree of heat and cold may act upon the inſtrument, in going from one place to another. Now, becauſe one experiment may be made in the morning, the water may be ſo cold, that when a ſecond experiment is made at noon the water cannot be brought to the ſame degree of cold it had in the morning; therefore, in making the firſt experiment, warm water muſt be mixed with the cold, and when the water has ſtood ſome time before it comes to be as cold as it is likely to be at the warmeſt part of that day, obſerve and ſet down the degree of the thermometer at which the ſpirit ſtands, and likewiſe the degree of the water in the barometer at D; then ſcrew on the cape at A, pour out the water, and carry the inſtrument to the place whoſe level you would know; then pour in your water, and when the thermometer is come to the ſame degree as before, open the ſcrew at top, and obſerve the liquor in the barometer.

The doctor's ſcale for the barometer is ten inches long, and divided into tenths; ſo that ſuch an inſtrument will ſerve for any heights not exceeding ten feet, each tenth of an inch anſwering to a foot in height.

The Dr made no allowance for the decreaſe of denſity in the air, becauſe he did not propoſe this machine for meaſuring mountains, (though with a proper allowance for the decreaſing denſity of the air, it will do very well), but for heights that want to be known in gardens, plantations, and the conveyance of water, where an experiment that anſwers two or three feet in a diſtance of twenty miles, will render this a very uſeful inſtrument.

Artillery Foot-Level is in form of a ſquare, having its two legs or branches of an equal length; at a juncture whereof is a little hole, whence hangs a thread and plummet playing on a perpendicular line in the middle of a quadrant. It is divided into twice 45 degrees from the middle, *ibid* n° 7.

This inſtrument may be uſed on other occaſions, by placing the ends of its two branches on a plane; for when the thread plays perpendicularly over the middle diviſion of the quadrant, that plane is aſſuredly level. To uſe it in gunnery, place the two ends on the piece of artillery, which you may raiſe to any propoſed height, by means of the plummet, whoſe thread will give the degree above the level.

Carpenters and Paviour's Level, conſiſts of a long ruler, in the middle whereof is fitted, at right angles, another ſomewhat bigger, at the top of which is faſtened a line, which, when it hangs over a fiducial line at right angles with the baſe, ſhews that the ſaid baſe is horizontal. Sometimes this level is all of one board. *Ibid.* n° 8.

Gunner's Level, for levelling cannons and mortars, conſiſts of a triangular braſs-plate, about four inches high, *ibid.* 9. at the bottom of which is a portion of a circle, divided into 45 degrees; which number is ſufficient for the higheſt elevation of cannons and mortars, and for giving ſhot the greateſt range: on the center of this ſegment of a circle is ſcrewed a piece of braſs, by means of which it may be fixed or ſcrewed at pleaſure; the end of this piece of braſs is made ſo as to ſerve for a plummet and index, in order to ſhew the different degrees of elevation of pieces of artillery. This inſtrument has alſo a braſs foot, to ſet upon cannons or mortars, ſo as, when thoſe pieces are horizontal, the inſtrument will be perpendicular. The foot of this inſtrument is to be placed on the piece to be elevated, in ſuch a manner, as that the point of the plummet may fall on the proper degree: this is what they call levelling the piece.

Maſon's Level, is compoſed of three rules, ſo joined as to form an iſoceles-rectangle, ſomewhat like a roman A; at the vertex whereof is faſtened a thread, from which hangs a plummet, that paſſes over a fiducial line, marked in the middle of the baſe, when the thing to which the level is applied is horizontal; but declines from the mark, when the thing is lower on one ſide than on the other.

Plumb, or *Pendulum*-Level, that which ſhews the horizontal lines by means of another line perpendicular to that deſcribed by a plummet or pendulum. This inſtrument, *ibid.* n° 10. conſiſts of two legs or branches, joined together at right angles, whereof that which carries the thread and plummet is about a foot and a half long; the thread is hung towards the top of the branch, at the point 2. The middle of the branch where the thread paſſes is hollow, ſo that it may hang free every where: but towards the bottom, where there is a little blade of ſilver, whereon is drawn a line perpendicular to the teleſcope, the ſaid cavity is covered by two pieces of braſs, making as it were a kind of caſe, leſt the wind ſhould agitate the thread; for which reaſon the ſilver blade is covered with a glaſs G, to the end that it may be ſeen when the thread and plummet play upon the perpendicular: the teleſcope is faſtened to the other branch of the inſtrument, and is about two feet long: having an hair placed horizontally acroſs the focus of the object-glaſs, which determines the point of the level. The teleſcope muſt be fitted at right angles to the perpendicular. It has a ball and ſocket, by which it is faſtened to the foot, and was invented by M Picard.

Reflecting Level, that made by means of a pretty long ſurface of water repreſenting the ſame object inverted which we ſee erected by the eye, ſo that the point where theſe two objects appear to meet is a level with the place where the ſurface of the water is found. This is the invention of M. Marriotte.

There is another reflecting level conſiſting of a mirror of ſteel, or the like, well poliſhed, and placed a little before the object-glaſs of a teleſcope, ſuſpended perpendicularly. This mirror muſt make an angle of 45° with the teleſcope, in which caſe the perpendicular line of the ſaid teleſcope is converted into a horizontal line, which is the ſame with the line of level. This is the invention of M. Caſſini.

Water-Level, that which ſhews the horizontal line by means of a ſurface of water or other liquor, founded on this principle, that water always places itſelf level. See the article Fluid.

The moſt ſimple is made of a long wooden trough, or canal, whoſe ſides are parallel to the baſe, ſo that being equally filled with water, its ſurface ſhews the line of level. This is the chorobates of the ancients. See Chorobata.

It is alſo made with two cups fitted to the two ends of a pipe, three or four feet long, about an inch in diameter, by means whereof the water communicates from the one to the other cup; and this pipe being moveable on its ſtand by means of a ball and ſocket, when the two cups become equally full of water, their two ſurfaces mark the line of level.

This inſtrument, inſtead of cups, may alſo be made with two ſhort cylinders of glaſs three or four inches long, faſtened to each extreme of the pipe with wax or maſtic. Into the pipe is poured ſome common or coloured water, which ſhews itſelf through the cylinders, by means whereof the line of level is determined; the height of the water, with reſpect to the center of the earth, being always the ſame in both cylinders: this level, though very ſimple, is yet very commodious for levelling ſmall diſtances.

Level *of Mr Huygens's invention*, conſiſts of a teleſcope *a*, *ibid.* n° 11. in form of a cylinder, going through a ferril, in which it is faſtened by the middle. This ferril has two flat branches *b b*, one above, and the other below; at the ends whereof are faſtened little moving pieces, which carry two rings, by one of which the teleſcope is ſuſpended to an hook at the end of the ſcrew 3, and by the other a pretty heavy weight is ſuſpended, in order to keep the teleſcope in equilibrio. This weight hangs in the box 5, which is almoſt filled with linſeed oil, oil of walnuts, or other matter

that will not eafily coagulate, for more aptly fettling the balance of the weight and telefcope. The inftrument carries two telefcopes clofe and very parallel to each other; the eye glafs of the one being againft the object-glafs of the other, that one may fee each way without turning the level. In the focus of the object-glafs of each telefcope muft a little hair be ftrained horizontally, to be raifed and lowered as occafion requires by a little fcrew. If the tube of the telefcope be not found level when fupended, a ferril or ring, 4, is put on it, and is to be flid along till it fixes to a level. The hook on which the inftrument is hung, is fixed to a flat wooden crofs; at the ends of each arm whereof there is a hook ferving to keep the telefcope from too much agitation in ufing or carriage. To the faid flat crofs is applied another hollow one, that ferves as a cafe for the inftrument; but the two ends are left open, that the telefcope may be fecured from the weather, and always in a condition to be ufed. The foot of this inftrument is a round brafs plate, to which are faftened three brafs ferils, moveable by means of joints wherein are put ftaves, and on this foot is placed the box.

N° 12. marked I, is a balance-level; which being fufpended by the ring, the two fights, when in equilibrio, will be horizontal, or in a level.

LEVELLING, the art of finding a line parallel to the horizon at one or more ftations, in order to determine the height of one place with regard to another. See the preceding article.

A truly level furface is a fegment of a fpherical furface, which is concentric to the globe of the earth. A true line of level is an arch of a great circle, which is imagined to be defcribed upon a truly level furface. The apparent level is a ftraight line drawn tangent to an arch or line of true level. Every point of the apparent level, except the point of contact, is higher than the true level: thus let EAG (Plate CIV. fig. 2. n° 1.) be an arch of a great circle drawn upon the earth; to a perfon who ftands upon the earth at A, the line HD is the apparent level parallel to his rational horizon RR; but this line, the farther it is extended from his ftation A, the farther it recedes from the center; for BC is longer than AC, and DC is longer than BC, *&c.* The common methods of levelling are fufficient for laying pavements of walks, for conveying water to fmall diftances, for placing horizontal dials, or aftronomical inftruments; but in levelling the bottoms of canals which are to convey water to the diftance of many miles, the difference between the apparent and true level muft be taken into the account: thus let IAL (*ibid.* n° 2.) be an arch of a great circle upon the earth: let it be required to cut a canal whofe bottom fhall be a true level from A to B, of the length of 5078 feet: the common method is to place the levelling inftrument in the bottom of the canal at A, and looking through the fights placed horizontally at a ftick fet up perpendicular at B, to make a mark where the vifual ray or point of the apparent level points at E, and then to fink the bottom of the canal at B as much below E as A is below D. But this will not give the true level: for according to Caffini's calculation, at the diftance of 5078 feet the apparent level is feven inches above the true; and therefore, to make a true level, B muft be funk feven inches lower than the apparent level directs; fo that if A be four feet below D, B muft be four feet feven inches below the mark E. We have here mentioned the error which will arife from placing the level at one end of the line to be levelled, and fhewn how to correct it; but in moft cafes it is better to take a ftation in the middle of the line to be levelled: thus, if the points H and B are to be levelled, place the inftrument in the middle at A, and fetting up fticks perpendicular at H and B, make marks upon each ftick where the apparent level points, as E and F; thofe points are level: and if you fink H as much below F, as B is below E, HAB will be a true level.

The operation of levelling is as follows: fuppofe the height of the point A (*ibid.* n° 3.) on the top of a mountain above that of the point B, and at the foot thereof, be required. Place the level about the middle diftance between the two points as in D, and ftaffs in A and B; and let there be perfons inftructed with fignals for raifing and lowering, on the faid ftaffs, little marks of pafteboard or other matter, the level being placed horizontally by the bubble, *&c.* Look towards the ftaff AE, and caufe the mark fo raifed to be lowered till the middle, upper edge, or other moft confpicuous part, appear in the vifual ray. Then meafuring exactly the perpendicular height of the point E above the point A, which fuppofe fix feet four inches; fet that down in your book: then turn the level horizontally about, that the eye-glafs of the telefcope may be ftill next the eye when you look the other way; if you have only plain fights, the inftrument need not be turned; and caufe the perfon at the ftaff B, to raife or lower his mark, till fome confpicuous part of it fall in the vifual ray, as at C: then meafure the perpendicular height of C above B, which fuppofe fixteen feet fix inches: fet this alfo down in the book above the other number of the firft obfervation; fubtract the one from the other, the remainder will be ten feet two inches, which is the difference of the level between A and B, or the height of the point A above the point B.

If the point D, where the inftrument is fixed, be in the middle between the two points A and B, there will be no neceffity for reducing the apparent level to the true level; the vifual ray in that cafe being raifed equally above the true level. If it be further required to know whether there be a fufficient defcent for conveying water from the fpring A (*ibid.* n° 4.) to the point B. Here, in regard the diftance from A to B is confiderable, it is required that feveral operations be made. Having then chofen a proper place for the firft ftation, as at I, fet up a ftaff in the point A, near the fpring, with a proper mark to flide up and down the ftaff, as L, and meafure the diftance from A to I, which fuppofe two thoufand yards. Then the level being adjufted in the point I, let the mark L be raifed and lowered till fuch time as you fpy fome confpicuous part of it through the telefcope or fights of the level, and meafure the height AL, which fuppofe thirteen feet five inches. But in regard the diftance AI is two thoufand yards, you muft have recourfe

to

to your table for a reduction, subtracting eleven inches, which will leave the height of AL twelve feet six inches, and this note down in your book. Now turn the level horizontally about, so that the eye-glass of the telescope may be towards A, and fixing up another staff at H, cause the mark G to be moved up and down till you spy some conspicuous part through the telescope or sights. Measure the height HG, which suppose seven yards one foot two inches. Measure likewise the distance of the points IH, which suppose one thousand three hundred yards; for which distance four inches eight lines must be subtracted from the height HG, which consequently will only leave seven yards nine inches four lines, to be taken down in your book. This done, remove the level forwards to some other eminence, as E, whence the staff H may be viewed; as also another staff at D, near the place whither the water is to be conveyed. The level being again adjusted in the point E, look back to the staff H; and managing the mark as before, the visual ray will give the point F. Measure the height HF, which suppose eleven feet six inches. Measure likewise the distance HE, which suppose a thousand yards, for which there is two inches nine lines of abatement; which being taken from the height HF, there will remain eleven feet three inches three lines; which enter in your book. Lastly, turning the level to look at the next staff D, the visual ray will give the point D. Measure the height of D from the ground, which suppose eight feet three inches. Measure also the distance from the station E to B, which suppose nine hundred yards, for which distance there are two inches three lines of abatement; which being taken from the height BD, there will remain eight feet nine lines; which enter as before.

For the manner of entering down observations in your book, observe, that when a proper place or station for the level between the two points has been pitched upon, write down the two heights observed at that station in two different columns, *viz.* under the first column, those observed in looking through the telescope when the eye was from the spring, or towards the point, which we may call back sights; and under the second column, those observed when the eye was next the spring, which we call foresights. Having summed up the heights of each column separately, subtract the lesser from the greater, the remainder will be the difference of the level between the points A and B. If the distance of the two points be required, add all the distances measured together; and dividing the difference of height by the yards of the distances, for each two hundred yards you will have a descent of about two inches nine lines.

Dr. Halley suggests a new method of levelling, performed wholly by means of the barometer, in which the mercury is found to be suspended to so much the less height, as the place is farther remote from the center of the earth; whence the different heights of the mercury in two places give the difference of level. This method has been put in practice by some of the French academy.

LEVELLING STAVES, instruments used in levelling, serving to carry the marks to be observed, and at the same time to measure the heights of those marks from the ground. They usually consist each of two long wooden rulers, made to slide over one another, and divide into feet, inches, *&c.*

LEVER, or LEAVER, in mechanics. See MECHANICS.

LEVERET, among sportsmen, denotes a hare in the first year of her age.

LEVIGATION, in pharmacy and chemistry, the reducing hard and ponderous bodies to an impalpable powder, by grinding them on a prophyry, or the like.

LEVITE, in a general sense, means all the descendants of Levi, among whom were the Jewish priests themselves, who being descended from Aaron, were likewise of the race of Levi: but it is more particularly used for an order of officers in that church, who were employed in performing the manual service of the temple, such as in fetching wood, water, and other things necessary for the sacrifices, and in singing and playing upon instruments of music.

LEVITICUS, a canonical book of the Old Testament, so called from its containing the laws and regulations relating to the priests, Levites, and sacrifices.

LEVITY, in physiology, the privation or want of weight in any body, when compared with another that is heavier than it, in which sense it stands opposed to gravity.

LEVY, in law, signifies to gather or collect, as to levy money; and to levy a fine of lands, is the passing a fine.

LEWARDEN, a city of the United Provinces, the capital of west Friesland: E. long. 5° 35′, N. lat. 53° 20′.

LEWES, a borough-town of Sussex, forty miles south of London, which sends two members to parliament.

LEWIS, the most northerly of any of the western islands of Scotland, lying in 8° odd minutes W. long. and between 58° and 59° odd minutes N. lat.

LEXICON, the same as dictionary, but chiefly used in speaking of Greek dictionaries. See DICTIONARY.

LEYDEN, a city of Holland, in which there is a famous university, situated twenty miles south of Amsterdam.

LEYTE, one of the Philippine islands, separated from the island Philippina by a narrow channel: E. long. 123°, N. lat. 11°.

LIBANUS, a range of mountains in Asiatic Turky, between Syria and Palestine, which extend from Sidon on the Levant, eastward beyond Damascus.

LIBATION, a religious ceremony among the ancient pagans, which consisted in an effusion of liquors poured on the head of the victims prepared for sacrifice.

LIBAW, a port-town of Poland, in the duchy of Courland, situated on a bay of the Baltic: E. long. 21°, N. lat. 56° 40′.

LIBELLULA, in the history of insects, a genus of four-winged flies, called in English dragon-flies, or adder-flies; the characters of which are these: The mouth is furnished with jaws; the feelers are shorter than the

breaſt; and the tail of the male terminates in a kind of hooked forceps. There are 21 ſpecies, chiefly diſtinguiſhed by their colour.

LIBER, among botaniſts, denotes the rind or inner bark of trees.

LIBERIA, in Roman antiquity, a feſtival obſerved on the ſixteenth of the calends of April, at which time the youth laid aſide their juvenile habit for the toga virilis, or habit peculiar to grown men.

LIBERTUS, in Roman antiquity, a perſon who from being a ſlave had obtained his freedom.

The difference between the liberti and libertini was this: the liberti were ſuch as had been actually made free themſelves, and the libertini were the children of ſuch perſons.

LIBERTY, in general, denotes a ſtate of freedom, in contradiſtinction to ſlavery.

According to Cicero, liberty is the power of living as a man pleaſes, or without being controlled by another.

In a legal ſenſe, liberty ſignifies ſome privilege that is held by charter or preſcription.

LIBRA, the Balance, in aſtronomy. See Astronomy, p. 487.

Libra, in Roman antiquity, a pound weight; alſo a coin, equal in value to twenty denarii.

LIBRARY, an edifice or apartment deſtined for holding a conſiderable number of books placed regularly on ſhelves; or, the books themſelves lodged in it.

The firſt who erected a library at Athens was the tyrant Piſiſtratus, which was tranſported by Xerxes into Perſia, and afterwards brought back by Seleucus Nicanor to Athens. Plutarch ſays, that under Eumenes there was a library at Pergamus that contained 200,000 books. That of Ptolemy Philadelphus, according to A. Gellius, contained 700,000, which were all burnt by Cæſar's ſoldiers. Conſtantine and his ſucceſſors erected a magnificent one at Conſtantinople, which in the eighth century contained 300.000 volumes; and among the reſt, one in which the Iliad and Odyſſey were written in letters of gold, on the guts of a ſerpent: but this library was burnt by order of Leo Iſaurus. The moſt celebrated libraries of ancient Rome, were the Ulpian and the Palatine, and in modern Rome that of the Vatican. The foundation of the Vatican library was laid by pope Nicholas, in the year 1450; it was afterwards deſtroyed in the ſacking of Rome by the conſtable of Bourbon, and reſtored by pope Sixtus V. and has been conſiderably enriched with the ruins of that of Heidelberg, plundered by count Tilly in 1682. One of the moſt complete libraries in Europe, is that erected by Coſmo de Medicis; though it is now exceeded by that of the French king, which was begun by Francis I. augmented by cardinal Richelieu, and completed by M. Colbert. The emperor's library at Vienna, according to Lambecius, conſiſts of 80.000 volumes, and 15,940 curious medals. The Bodleian library at Oxford exceeds that of any univerſity in Europe, and even thoſe of any of the ſovereigns of Europe, except the emperor's and the French king's, which are each of them older by a hundred years. It was firſt opened in 1602, and has ſince been increaſed by a great number of benefactors: indeed the Medicean library, that of Beſſarion at Venice, and thoſe juſt mentioned, exceed it in Greek manuſcripts; but it outdoes them all in Oriental manuſcripts; and as to printed books, Ambroſian at Milan, and that of Wolfembuttle, are two of the moſt famous, and yet both are inferior to the Bodleian. The Cotton library conſiſts wholly of manuſcripts, particularly of ſuch as relate to the hiſtory and antiquities of Britain; which, as they are now bound, make about 1000 volumes.

In Edinburgh there is a good library belonging to the univerſity, well furniſhed with books; which are kept in good order, and cloiſtered up with wire-doors, that none but the keeper can open, and are now lent out only upon conſignation of the price; a method much more commodious than the multitude of chains uſed in other libraries. There is alſo a noble library of books and manuſcripts belonging to the faculty of Advocates. See Advocate.

LIBRATION, in aſtronomy, an apparent irregularity of the moon's motion, whereby ſhe ſeems to librate about her axis, ſometimes from the eaſt to the weſt, and now and then from the weſt to the eaſt. See Astronomy.

LIBYA, in ancient geography, a large extent of Africa, lying ſouth-weſt of Egypt.

LICENCE, in law, an authority given to a perſon to do ſome lawful act.

LICENTIATE, one who has obtained the degree of a licence.

The greateſt number of the officers of juſtice in Spain, are diſtinguiſhed by no other title but that of licentiate. In order to paſs licentiate in common law, civil law, and phyſic, they muſt have ſtudied ſeven years; and in divinity, ten. Among us, a licentiate uſually means a phyſician who has a licence to practiſe, granted by the college of phyſicians.

LICHEN, liver-wort, in botany, a genus of the cryptogamia algæ claſs. The receptacle is roundiſh, plain, and ſhining; and the farina is diſperſed upon the leaves. There are 85 ſpecies, all natives of Britain.

LICTORS, in Roman antiquity, the ſerjeants or beadles who carried the faſces before the ſupreme magiſtrates: it was alſo a part of their office to be the public executioners in beheading, ſcourging, &c.

LIDDESDALE, a county of Scotland, bounded by Tiviotdale, on the north; Cumberland, on the ſouth-eaſt; and Annandale, on the ſouth-weſt.

LIEGE, in law, a term ſometimes uſed for liege lord, or one who owns no ſuperior.

Liege poustie, in Scots law, is oppoſed to death bed; and ſignifies a perſon's enjoying that ſtate of health, in which only he can diſpoſe of his property at pleaſure. See law, Tit. xxvii. 28.

Liege, in geography, the capital of the biſhopric of the ſame name in Germany, ſituated on the river Maes, twelves miles ſouth of Maeſtricht; E. long. 5° 36′, N. lat. 50° 40′.

LIENTERY, is a flux of the belly, in which, whatever is

is taken in is difcharged by ftool as it is fwallowed, or very little altered either in colour or fubftance. See MEDICINE.

LIEUTENANT, an officer who fupplies the place and difcharges the office of a fuperior in his abfence. Of thefe, fome are civil, as the lords-lieutenants of kingdoms, and the lord-lieutenants of counties; and others are military, as the lieutenant general, lieutenant-general of the artillery, lieutenant colonel, lieutenant of the artillery of the tower, lieutenants of horfe, foot, fhips of war, *&c.*

Lord LIEUTENANT *of Ireland*, is properly a viceroy, and has all the ftate and grandeur of a king of England, except being ferved upon the knee. He has the power of making war and peace, of beftowing all the offices under the government, of dubbing knights and of pardoning all crimes except high treafon: he alfo calls and prorogues the parliament, but no bill can pafs without the royal affent. He is affifted in his government by a privy counfel; and, on his leaving the kingdom, he appoints the lords of the regency, who govern in his abfence.

Lords LIEUTENANTS *of counties*, are officers, who, upon any invafion or rebellion, have power to raife the militia, and to give commiffions to colonels and other officers, to arm and form them into regiments, troops and companies. Under the lords lieutenants, are deputy-lietenants, who have the fame power; thefe are chofen by the lords lieutenants out of the principal gentlemen of each county, and prefented to the king for his approbation.

LIEUTENANT-GENERAL, is an officer next in rank to the general: in battle, he commands one of the wings; in a march, a detachment, or a flying camp; alfo a quarter, at a fiege, or one of the attacks, when it is his day of duty.

LIFE, is peculiarly ufed to denote the animated ftate of living creatures, or the time that the union of their foul and body lafts.

LIFERENT, in Scots law. When the ufe or enjoyment of a fubject is given to a perfon during his life, it is faid to belong to him in liferent. See LAW, Tit. xvi. 21.

LIGAMENT, in anatomy, a ftrong compact fubftance, ferving to join two bones together. See ANATOMY.

LIGATURE, in furgery, is a chord, band, or ftring; or the binding any part of the body with a chord, band, fillet, *&c.* whether of leather, linnen, *&c.*

Ligatures are ufed to extend and replace bones that are broken or diflocated; to tie the patients down in lithotomy and amputations; to tie upon the veins in phlebotomy, or the arteries in amputations, or in large wounds; to fecure the fplints that are applied to fractures; to tie up the proceffes of the peritonæum, with the fpermatic veffels in caftration; and, laftly, in taking off warts or other excrefcences by ligature.

LIGHT, in phyfiology, certain fubtile particles of matter, capable of exciting in us the fenfation of colours. See OPTICS.

LIGHTENING, the burfting of fire from a cloud or the earth. See ELECTRICITY.

LIGHTER, in naval achitecture, a large kind of boat ufed in the river of Thames for carrying heavy goods, as coals, timber, *&c.*

LIGNICENSIS *terra*, in the materia medica, the name of a fine yellow hole, dug in many parts of Germany, particularly about Emeric in the circle of Weftphalia, and ufed in cordial and aftringent compofitions.

LIGULATED, among botanifts, an appellation given to fuch flofcules as have a ftraight end turned downwards, with three indentures, but not divided into fegments.

LIGUSTICUM, LOVAGE, in botany, a genus of the pentandria digynia clafs. The fruit is oblong, with five furrows on each fide. There are fix fpecies, two of them natives of Britain, *viz* the fcotticum, or Scottifh fea parfley; and the cornubienfe, or Cornwal faxifrage.

LIGUSTRUM, PRIVET, in botany, a genus of trees belonging to the diandria monogynia clafs. The corolla confifts of four fegments; and the berry has four feeds. There is but one fpecies, *viz.* the vulgare or privet, a native of Britain.

LILIADEOUS, an appellation given to fuch flowers as refemble that of the lily.

LILIUM, in botany, a genus of the hexandria monogynia clafs. The corolla is bell-fhaped, and confifts of fix petals, with a longitudinal nectariferous line; and the valves of the capfule are connected with a lattice-work of hair. There are nine fpecies, none of them natives of Britain. The root of the white lily is reckoned emollient and fuppurative.

LIMA, a province of Peru, in South America; the capital of which, called alfo Lima, was almoft entirely deftroyed by an earthquake in 1746: W. long. 76°, and S. lat. 12° 30′.

LIMAX, in zoology, a genus of infects belonging to the order of vermes mollufca; the characters of which are thefe: The body is oblong, fitted for crawling, with a kind of mufcular coat on the upper part; and the belly is plain: they have a roundifh hole in the fide, near the neck, which ferves the purpofes of genitals, and for voiding their excrements: they have likewife four tentacula or horns, fituate above the mouth, which they extend or retract at pleafure. There are eight fpecies, diftinguifhed entirely by their colour, as the black fnail; the white fnail; the reddifh fnail; the afh-coloured fnail; *&c.* Snails are faid to be hermaphrodites, and mutually impregnate each other.

LIMB, in a general fenfe, denotes the border or edge of a thing: thus, we fay, the limb of a quadrant, of the fun, of a leaf, *&c.*

LIMB, in anatomy, an appellation given to the extremities of the body, as the arms and legs.

LIMB, *limbus*, in the church of Rome, is ufed in two different fenfes. 1. The limb of the patriarchs is faid to be the place where the patriarchs waited the redemption of mankind: in this place, they fuppofe our Saviour's foul continued from the time of his death to his refurrection. 2. The limb of infants, dying without baptifm, a place fuppofed to be diftinct both from heaven and hell; fince, fay they, children dying innocent of any actual fin do not deferve hell, and by reafon of their original fin cannot be admitted into heaven.

LIMBURG,

LIMBURG, the capital of a dutchy of the ſame name, in the Auſtrian Netherlands, twenty miles ſouth-eaſt of Liege: E. long 6° 5′, and N. lat. 50° 37′.

LIME. See CHEMISTRY, p. 76.

LIMERIC, the capital of a county of the ſame name in Ireland, ſituated on the river Shannon, fifty two miles north of Cork: W. long. 8°30′, N. lat 52° 35′.

LIMINGTON, or LEMINGTON, a borough-town of Hampſhire, twelve miles ſouth-weſt of Southampton. It ſends two members to parliament.

LIMIT, in a reſtrained ſenſe, is uſed by mathematicians for a determinate quantity to which a variable one continually approaches; in which ſenſe, the circle may be ſaid to be the limit of its circumſcribed and inſcribed polygons. In algebra, the term limits is applied to two quantities, one of which is greater, and the other leſs, than another quantity: and in this ſenſe it is uſed, in ſpeaking of the limits of equations, whereby their ſolution is much facilitated. See ALGEBRA.

LIMNING, the art of painting in water-colours, in contradiſtinction to painting, which is done in oil-colours. See PAINTING.

Limning is by far more ancient than painting in oil; this laſt being firſt invented by John Van Eych, a Flemiſh painter, in 1410.

In limning, all colours are proper enough, except the white, made of lime, which is only uſed in freſco. The azure and ultramarine muſt always be mixt with ſize or gum: but there are always applied two lays of hot ſize, before the ſize colours are laid on: the colours are all ground in water, each by itſelf, and, as they are required in working, are diluted with ſize water.

When the piece is finiſhed, they go over it with the white of an egg, well beaten; and then with varniſh, if required.

To limn or draw a face in colours: having all the materials in readineſs, lay the prepared colour on the card even and thin, free from hairs and ſpots, over the place where the picture is to be. The ground being laid, and the party placed in a due poſition, begin the work; which is to be done at three ſittings. At the firſt, you are only to dead-colour the face, which will require about two hours. At the ſecond ſitting, go over the work more curiouſly. adding its particular graces or deformities. At the third ſitting, finiſh the whole; carefully remarking whatever may conduce to render the piece perfect, as the caſt of the eyes, moles, ſcars, geſtures, and the like.

LIMODORUM, in botany, a genus of the gynandria diandria claſs. The nectarium conſiſts of one concave, pedicellated leaf, ſituate with the undermoſt petal. There is but one ſpecies, a native of North America.

LIMON. See CITRUS.

LIMOSELLA, in botany, a genus of the didynamia angioſpermia claſs. The calix conſiſts of five ſegments, and the corolla of five equal diviſions; the ſtamina are approximated in pairs; and the capſule has one cell and two valves, containing many ſeeds.

LIMPET. See PATELLA.

LINARIA, in ornithology. See FRINGILLA.

LINCOLN, the capital city of the county of Lincoln: W. long. 27′, N. lat. 53° 16′. It ſends two members to parliament.

LINE, in geometry, a quantity extended in length only, without any breadth or thickneſs. It is formed by the flux or motion of a point. See FLUXIONS, and GEOMETRY.

LINE, in the art of war, is underſtood of the diſpoſition of an army, ranged in order of battle, with the front extended as far as may be, that it may not be flanked.

LINE *of battle*, is alſo underſtood of the diſpoſition of a fleet on the day of the engagement, on which occaſion the veſſels are uſually drawn up as much as poſſible in a ſtraight line, as well to gain and keep the advantage of the wind, as to run the ſame board.

Ship of the LINE, a veſſel large enough to be drawn up in the line, and to have a place in a ſea-fight.

LINE, in genealogy, a ſeries or ſucceſſion of relations in various degrees, all deſcending from the ſame common father.

LINE alſo denotes a French meaſure, containing the twelfth part of an inch, or the hundred and forty-fourth part of a foot. Geometricians conceive the line ſubdivided into ſix points. The French line anſwers to the Engliſh barley corn.

LINES, in heraldry, the figures uſed in armories, to divide the ſhield into different parts, and to compoſe different figures. Theſe lines, according to their different forms and names, give denomination to the pieces or figures which they form, except the ſtraight or plain lines.

LINEA ALBA, in anatomy. See ANATOMY, p. 192.

LINEAMENT, among painters, is uſed for the out-lines of a face.

LINEAR NUMBERS, in mathematics, ſuch as have relation to length only; ſuch is a number which repreſents one ſide of a plane figure. If the plane figure be a ſquare, the linear number is called a root.

LINEAR PROBLEM, that which may be ſolved geometrically by the interſection of two right lines. This is called a ſimple problem, and is capable but of one ſolution.

LINEN. See LINNEN.

LING, in ichthyology. See GADUS.

LINGEN, a town of Germany, in the circle of Weſtphalia, capital of a county of the ſame name, ſituated on the river Ems, forty five miles north of Munſter.

LINGUATULA, in ichthyology. See PLEURONECTES.

LINIMENT, in pharmacy, a compoſition of a conſiſtence ſomewhat thinner than an unguent, and thicker than an oil, uſed for anointing different parts of the body in various intentions.

The materials proper for compoſing of a liniment, are oils, fats, balſams, and whatever enters the compoſition of unguents and plaſters.

LINLITHGOW, a town of Scotland, in the county of Lothian, capital of the county of Linlithgow, ſituated ſixteen miles weſt of Edinburgh.

LINNÆA, in botany, a genus of the didynamia angioſpermia claſs. The calix is double; the corolla is bell-ſhaped; and the berry is dry, and contains two ſeeds.

feeds. There is but one fpecies, a native of Sweeden.

LINNEN, in commerce, a well-known kind of cloth, chiefly made of flax. See FLAX.

In order to fucceed in the linnen-manufacture, one fet of people fhould be confined to the plowing and preparing the foil, fowing and covering the feed, to the weeding, pulling, rippling, taking care of the new feed, and watering and graffing the flax, till it is lodged at home: others fhould be concerned in the drying, breaking, fcutching, and heckling the flax, to fit it for the fpinners; and others in fpinning and reeling it, to fit it for the weaver; others fhould be concerned in taking due care of the weaving, bleaching, beetling, and finifhing the cloth for the market. It is reafonable to believe, that if thefe feveral branches of the manufacture were carried on by diftinct dealers in Scotland and Ireland, where our home-made linnens are manufactured, the feveral parts would be better executed, and the whole would be afforded cheaper, and with greater profit.

LINNET, in ornithology. See FRINGILLA.

LINSEED, the feed of the plant linum. Linfeed bruifed and fteeped in water, gives it very foon a thick mucilaginous nature, and communicates much of its emollient virtues to it.

LINT. See LINNEN and FLAX.

LINTEL, in architecture, a piece of ftone or timber that lies horizontally over door-pofts and window-jambs, as well to bear the thicknefs of the wall over it, as to bind the fides of the wall together.

LINTON, a market-town of Cambridgefhire, fituated ten miles fouth-eaft of Cambridge.

LINTS, or LINTZ, a beautiful city, capital of Upper Auftria, with a ftrong citadel.

LINUM, FLAX, in botany, a genus of the pentandria pentagynia clafs. The calix confifts of five leaves, and the corolla of five petals; the capfule has five valves, and ten cells; and the feeds are folitary. There are 22 fpecies, five of them natives of Britain, *viz.* the ufitatiffimum, or common flax; the perenne, or blue flax; the tenuifolium, or narrow-leaved wild flax; the catharticum, or purging flax; and the radiola, leaft rupture-wort, or all-feed. See FLAX.

LION, in zoology. See FELIS.

LIONCELLES, in heraldry, a term ufed for feveral lions borne in the fame coat of arms.

LIP, in anatomy. See ANATOMY, p. 305.

Hare-LIP, a diforder, in which the upper lip is in a manner flit or divided, fo as to refemble the upper lip of a hare, whence the name. See SURGERY.

LIPOTHYMIA, FAINTING, in medicine, may arife from feveral caufes, as too violent exercifes, fuppreffion of the menfes or other accuftomed evacuations, *&c.* See MEDICINE.

LIPPIA, in botany, a genus of the didynamia angiofpermia clafs. The calix confifts of four roundifh, erect, and membranaceous teeth; the capfule is ftraight, has two valves, one cell, and two feeds. There are two fpecies, none of them natives of Britain.

LIQUIDAMBER, in botany, a genus of the monœcia polyandria clafs. The calix has four leaves; it has no corolla, but numerous filaments: the calix of the male confifts of four leaves in the form of a globe; it has no corolla, but a couple of ftyli; and the capfules, which are numerous, are round, with a double valve, and contains many feeds. There are two fpecies, both natives of America. This tree yields a fragrant refin, called liquidamber, which refolves and opens obftructions.

LIQUOR, a name fignifying any fluid fubftance.

LIQUORICE. See GLYCYRRHIZA.

LIRIODENDRUM, the TULIP-TREE, in botany, a genus of the polyandria polygynia clafs. The calix confifts of three leaves, and the corolla of nine petals; and the feeds are imbricated upon a ftrobilus. There are two fpecies, none of them natives of Britain.

LISBON, the capital of Portugal, fituated on the north bank of the Tagus, about ten miles from its mouth, and eighty miles weft of the frontiers of Spain: W. long. 9° 25′, N. lat. 38° 25′. It is about fix miles long, winding with the river, from whence it rifes with an eafy afcent, and is computed to contain about 30,000 houfes, 200,000 inhabitants, forty parifh-churches, and forty convents of both fexes.

LISIEUX, a large city and bifhop's fee of France, in the province of Normandy: E. long. 16′, and N. lat. 40° 14′.

LISLE, or RYSSEL, a large and populous city, the capital of French Flanders, fituated on the river Deule, twelve miles weft of Tournay: E. long. 3°, and N. lat. 50° 42′,

LIST, in commerce, the bordure of cloth, or of ftuff; ferving not only to fhew their quality, but to preferve them from being torn in the operations of fulling, dying, *&c.*

Lift is ufed on various ocaafions; but chiefly by gardeners for fecuring their wall-trees.

LITANY, a folemn form of fupplication to God, in which the prieft utters fome things fit to be prayed for, and the people join in their interceffion, faying, *We befeech thee to hear us, good Lord,* &c.

LITCHFIELD, a city of Staffordfhire, one hundred miles north-weft of London, and twelve fouth-eaft of Stafford. This city and Coventry have one bifhop between them; it fends two members to parliament.

LITERATI, in general, denotes men of learning; but is more particularly ufed by the Chinefe for fuch perfons as are able to read and write their language.

LITHANTHRAX, PIT-COAL, in natural hiftory, a genus of foffils, defined to be folid, dry, opake, inflammable fubftances, found in large ftrata, fplitting horizontally more eafily than in any other direction, of a gloffy hue, foft and friable, not fufible, but eafily inflammable, and leaving a large refiduum of afhes.

Of this genus there are three fpecies: 1. The hard, dufky, black coal, known by the name of Scotch coal. 2. The hard, gloffy, black coal, known by the fame name. 3. The friable, gloffy, black coal, called Newcaftle coal, as being chiefly dug about that town.

LITHARGE, is properly a recrement of lead, or lead vitrified, either alone, or with a mixture of copper. See CHEMISTRY, p. 84.

LITHIDIA, in natural hiſtory, the name of a large claſs of foſſils, including the flint and pebble kinds.

The lithidia are defined to be ſtones of a debaſed cryſtalline matter, covered by, and ſurrounded with, an opake cruſt, and frequently of great beauty, and conſiderable brightneſs within, though of but a ſlight degree of tranſparency, approaching to the nature of the ſemi pellucid gems, and like them found in not very large maſſes.

LITHOGINESIA, a term uſed by ſome authors for the formation of ſtones. See STONE.

LITHOMARGA, *Stone-marle*, a name given by ſome authors to a ſparry ſubſtance highly debaſed by earth, which is found in great plenty in the caves of the Hart's foreſt in Germany, and uſed there.

LITHONTRIPTICS, medicines which either break, or are ſuppoſed to have the virtue of breaking, ſtones in the urinary paſſages. See MEDICINE.

LITHOPHYTA, the name of Linnæus's third order of vermes. See NATURAL HISTORY.

LITHOSPERMUM, GROMWELL, in botany, a genus of the pentandria monogynia claſs. The corolla is funnel-ſhaped, with a naked perforated faux; and the calix conſiſts of five ſegments. There are ſix ſpecies, three of them natives of Britain; viz. the officinale, or gromwell; the purpuro-cæruleum, or leſſer creeping gromwell; and the arvenſe, or baſtard alkanet. The ſeeds of the officinale are accounted diuretic.

LITHOSTROTION, in natural hiſtory, a name of a ſpecies of foſſil coral, compoſed of a great number of long and ſlender columns, ſometimes round, ſometimes angular, joined nicely to one another, and of a ſtarry or radiated ſurface at their tops. Theſe are found in conſiderable quantities in the northern and weſtern parts of this kingdom, ſometimes in ſingle, ſometimes in complex ſpecimens.

LITHOTOMY, in ſurgery, cutting for the ſtone. See SURGERY.

LITHOZUGIA, in natural hiſtory, a genus of foſſils, compoſed of a ſimple ſtony matter, making a kind of cement, and holding firmly together ſmall pebbles *&c.* embodied in it.

LITHUANIA, a province of Poland, bounded by Samogitia, Livonia, and part of Ruſſia, on the north; by another part of Ruſſia, on the eaſt; by Volhinia and Poleſia, on the ſouth; and by Pruſſia and Polachia, on the weſt.

LITISCONTESTATION, in Scots law. See LAW, Tit. xxx. 33.

LITURGY, a name given to thoſe ſet forms of prayer which have been generally uſed in the Chriſtian church. Of theſe there are not a few aſcribed to the apoſtles and fathers, but they are almoſt univerſally allowed to be ſpurious.

LITUUS, in Roman antiquity, a ſhort ſtraight rod, only bending a little at one end, uſed by the augurs. See AUGUR.

LIVADIA, the capital of a province of European Turky, the ancient Achaia, ſituated on the north ſide of the gulph of Lepanto: E. long. 23° 15′, N. lat. 27° 30′.

LIVER, in anatomy. See ANATOMY, p. 264.

LIVER-WORT, in botany. See LICHEN.

LIVERPOOL, or LEVERPOOL, a port town of Lancaſhire, fifteen miles north of Cheſter, which ſends two members to parliament.

LIVERYMEN *of London* are a number of men choſen from among the freemen of each company. Out of this body the common council, ſheriff, and other ſuperior officers for the government of the city are elected, and they alone have the privilege of giving their votes for members of parliament; from which the reſt of the citizens are excluded.

LIVONIA, a province of Ruſſia, 160 miles long, and 120 broaded; bounded by the gulph of Finland, on the north; by Ingria and great Novogorod, on the eaſt; by Lithuania and Courland, on the ſouth; and by the Baltic, on the weſt: its chief towns are Narva, Revel, and Riga.

LIVONICA TERRA, a kind of fine bole uſed in the ſhops of Germany and Italy. Theſe earths are both dug out of the ſame pit, in the place from whence they have their name, and in ſome other parts of the world. They are generally brought to us made up into little cakes, and ſealed with the impreſſion of a church and an eſcutcheon with two croſs keys. In Spain and Portugal they are much uſed, ſometimes ſingly, ſometimes mixed together, and are good in fevers and in fluxes of all kinds.

LIVRE, a French money of account, containing twenty ſols.

LIXIVIOUS, an appellation given to ſalts obtained from burnt vegetables by lotion.

LIXIVIUM, in pharmacy, *&c.* a ley, obtained by pouring ſome liquor upon the aſhes of plants; which is more or leſs powerful, as it has imbibed the fixed ſalts contained in the aſhes.

LIZZARD, in zoology. See LACERTA.

LIZZARD, in geography, a cape, or promontory of Cornwall, fifteen miles ſouth of Falmouth: W. long. 5° 47′, N. lat. 49° 50′.

LOACH, in ichthyology. See COBITIS.

LOADSTONE. See MAGNET.

LOAMS, in natural hiſtory, are defined to be earths compoſed of diſſimilar particles, hard, ſtiff, denſe, and hard and rough to the touch; not eaſily ductile while moiſt, readily diffuſible in water, and compoſed of ſand and a tough viſcid clay. Of theſe loams, ſome are whitiſh, and others brown or yellow.

LOBE, in anatomy, any fleſhy protuberant part, as the lobes of the lungs, lobes of the ears, *&c.*

LOBELIA, in botany, a genus of the ſyngeneſia monogynia claſs. The calix conſiſts of five ſegments, and the corolla of one irregular petal; and the capſule has two and ſometimes three cells. There are 26 ſpecies, only one of them a native af Britain, *viz.* the dortinanna, or water gladiale.

LOCAL, in law, ſomething fixed to the freehold, or tied to a certain place: thus real actions are local, ſince they muſt be brought in the country where they lie: and local cuſtoms are thoſe peculiar to certain countries and places.

LOCAL MEDICINES, thofe deftined to act upon particular parts; fuch are fomentations, epithems, veficatories, &c.

Decree of LOCALITY, in Scots law, a decree proportioning a minifter's ftipend among the different perfons liable in payment of it. See LAW, Tit. v. 13.

LOCATELLUS's BALSAM, in pharmacy, a celebrated balfam, the preparation whereof is directed in the Edinburgh difpenfatory thus: Take of yellow-wax, one pound; oil olive, a pint and a half; Venice turpentine, a pound and a half; balfam of Peru, two ounces; dragon's blood, one ounce: melt the wax in the oil over a gentle fire; then add the turpentine; and having taken them from the fire, mix in the balfam of Peru and dragon's blood, keeping them continually ftirring till grown cold.

This balfam is ufed in internal bruifes and hæmorrhages, erofions of the inteftines, ulcerations of the lungs, dyfenteries, and in fome coughs and afthmas.

LOCHIA, in medicine, a flux from the uterus, confequent to delivery. See MIDWIFERY.

LOCHMABEN, a town of Scotland, fifteen miles eaft of Dumfries.

LOCK, a well-known inftrument ufed for faftening doors, chefts, &c. generally opened by a key.

LOCKMAN, an officer in the ifle of Man, who executes the orders of the government, much like our under fheriff.

LOCRIDA, a town of Turky in Europe, feventy miles fouth-eaft of Durazzo: E. long. 21°, N. lat. 41.

LOCUS GEOMETRICUS, denotes a line, by which a local or indeterminate problem is folved.

A locus is a line, any point of which may equally folve an indeterminate problem. Thus, if a right line fuffice for the conftruction of the equation, it is called *locus ad rectum;* if a circle, *locus ad circulum;* if a parabola, *locus ad parabolam;* if an ellipfis, *locus ad ellipfin;* and fo of the reft of the conic fections.

LOCULAMENT, among botanifts, denotes a cell, or partition, in a feed pod, for the feed of a plant.

LOCUST, in zoology. See GRYLLUS.

LODGMENT, in military affairs, is a work raifed with earth, gabions, fafcines, wool-packs, or mantelets, to cover the befiegers from the enemies fire, and to prevent their lofing a place which they have gained, and are refolved, if poffible, to keep.

LOEFLINGIA, in botany, a genus of the triandria monogynia clafs. The calix confifts of five leaves, and the corolla of five fmall petals; and the capfule has one cell, and three valves. There is but one fpecies, a native of Spain.

LOESELIA, in botany, a genus of the didynamia angiofpermia clafs. The calix confifts of four fegments; and the capfule has three cells. There is but one fpecies, a native of America.

LOG, in naval affairs, is a flat piece of wood, fhaped fomewhat like a flounder, with a piece of lead faftened to its bottom, which makes it ftand or fwim upright in the water. See Plate CIII. fig. 4.

LOGARITHMIC CURVE. If on the line AN (Plate CIII. fig. 5.) both ways indefinitely extended, be taken, A C, C E, E G, G I, I L, on the right hand; and alfo Ag, g P, &c. on the left, all equal to one another: and if at the points P g, A, C, E, G, I, L, be erected to the right line A N, the perpendiculars P S, g d, A B, C D, E F, G H, I K, L M, which let be continually proportional, and reprefent numbers, *viz.* A B, 1; C D, 10; E F, 100, &c. then fhall we have two progreffions of lines, arithmetical and geometrical: for the lines A C, A E, A G, &c. are in arithmetical progreffion, or as 1, 2, 3, 4, 5, &c. and fo reprefent the logarithms to which the geometrical lines A B, C D, E F, &c. do correfpond. For fince A G is triple of the firft line A C, the number G H fhall be in the third place from unity, if C D be in the firft: fo likewife fhall L M be in the fifth place, fince $AL = 5\ AC$. If the extremities of the proportionals S, d, B, D, F, &c. be joined by right lines, the figures S B M L will become a polygon, confifting of more or lefs fides, according as there are more or lefs terms in the progreffion.

If the parts A C, C E, E G, &c. be bifected in the points, c, e, g, i, l, and there be again raifed the perpendiculars $c\,d$, $e\,f$, $g\,h$, $i\,k$, $l\,m$, which are mean proportionals between A B, C D; C D, E F, &c. then there will arife a new feries of proportionals, whofe terms, beginning from that which immediately follows unity, are double of thofe in the firft feries, and the difference of the terms is become lefs, and approach nearer to a ratio of equality than before. Likewife, in this new feries, the right lines A L, A c, exprefs the diftances of the terms L M, $c\,d$, from unity, *viz.* fince A L is ten times greater than A c, L M fhall be the tenth term of the feries from unity; and becaufe A e is three times greater than A c, $e\,f$ will be the third term of the feries if $c\,d$ be the firft, and there fhall be two mean proportionals between AB and ef, and between A B and L M there will be nine mean proportionals. And if the extremities of the lines B d, D f, F h, &c. be joined by right lines, there will be a new polygon made, confifting of more but fhorter fides than the laft.

If, in this manner, mean proportionals be continually placed between every two terms, the number of terms at laft will be made fo great, as alfo the number of the fides of the polygon, as to be greater than any given number, or to be infinite; and every fide of the polygon fo leffened, as to become lefs than any given right line; and confequently the polygon will be changed into a curve-lined figure; for any curve-lined figure may be conceived as a polygon, whofe fides are infinitely fmall and infinite in number. A curve defcribed after this manner, is called logarithmical.

It is manifeft from this defcription of the logarithmic curve, that all numbers at equal diftances are continually proportional. It is alfo plain, that if there be four numbers, A B, C D, I K, L M, fuch that the diftance between the firft and fecond be equal to the diftance between the third and the fourth, let the diftance from the fecond to the third be what it will, thefe numbers will be proportional. For becaufe the diftances A C, I L, are equal, A B fhall be to the increment D s, as I K is to the increment M T. Where-

fore,

fore, by compofition, AB : DC : : IK : ML. And, contrariwife, if four numbers be proportional, the diftance between the firft and fecond fhall be equal to the diftance between the third and fourth.

The diftance between any two numbers, is called the logarithm of the ratio of thofe numbers; and, indeed, doth not meafure the ratio itfelf, but the number of terms in a given feries of geometrical proportionals, proceeding from one number to another, and defines the number of equal ratios by the compofition whereof the ratio of numbers is known.

LOGARITHMS, are the indexes or exponents (moftly whole numbers and decimal fractions, confifting of feven places of figures at leaft) of the powers or roots (chiefly broken) of a given number; yet fuch indexes or exponents, that the feveral powers or roots they exprefs, are the natural numbers, 1, 2, 3, 4, 5, *&c.* to 10 or 100000, *&c.* (as, if the given number be 10, and its index be affumed 1.0000000, then the 0.0000000 root of 10, which is 1, will be the logarithm of 1; the 0.301036 root of 10, which is 2, will be the logarithm of 2; the 0,477121 root of 10, which is 3, will be the logarithm of 3; the 1.612060 root of 10, the logarithm of 4; the 1.041393 power of 10 the logarithm of 11; the 1.079181 power of 10 the logarithm of 12, *&c.*) being chiefly contrived for eafe and expedition in performing of arithmetical operations in large numbers, and in trigonometrical calculations; but they have likewife been found of extenfive fervice in the higher geometry, particularly in the method of fluxions. They are generally founded on this confideration, that if there be any row of geometrical proportional numbers, as 1, 2. 4, 8, 16, 32, 64, 128, 256, *&c* or 1, 10, 100, 1000, 10000, *&c.* and as many arithmetical progreffional numbers adapted to them, or fet over them, beginning with 0,

thus, $\begin{Bmatrix} 0, & 1, & 2, & 3, & 4, & 5, & 6, & 7, & \&c. \\ 1, & 2, & 4, & 8, & 16, & 32, & 64, & 128, & \&c. \end{Bmatrix}$

or, $\begin{Bmatrix} 0, & 1, & 2, & 3, & 4, & \&c. \\ 1, & 10, & 100. & 1000, & 10000, & \&c. \end{Bmatrix}$

then will the fum of any two of thefe arithmetical progreffionals, added together, be that arithmetical progreffional which anfwers to or ftands over the geometrical progreffional, which is the product of the two geometrical progreffionals over which the two affumed arithmetical progreffionals ftand: again, if thofe arithmetical progreffionals be fubtracted from each other, the remainder will be the arithmetical progreffional ftanding over that geometrical progreffional which is the quotient of the divifion of the two geometrical progreffionals belonging to the two firft affumed arithmetical progreffionals; and the double, triple, *&c.* of any one of the arithmetical progreffionals, will be the arithmetical progreffional ftanding over the fquare, cube, *&c.* of that geometrical progreffional which the affumed arithmetical progreffional ftands over, as well as the $\frac{1}{2}$, $\frac{1}{3}$, *&c.* of that arithmetical progreffional will be the geometrical progreffional anfwering to the fquare root, cube root, *&c.* of the arithmetical progreffional over it; and from hence arifes the following common, though lame and imperfect definition of logarithms; *viz.*

"That they are fo many arithmetical progreffionals, anfwering to the fame number of geometrical ones." Whereas, if any one looks into the tables of logarithms, he will find, that thefe do not all run on in an arithmetical progreffion, nor the numbers they anfwer to in a geometrical one; thefe laft being themfelves arithmetical progreffionals. Dr Wallis, in his hiftory of algebra, calls logarithms the indexes of the ratios of numbers to one another. Dr Halley, in the philofophical tranfactions, n° 216, fays, they are the exponements of the ratios of unity to numbers. So alfo Mr Cotes, in his Harmonia Menfurarum, fays, they are the numerical meafures of ratios. But all thefe definitions convey but a very confufed notion of logarithms. Mr Maclaurin, in his Treatife of Fluxions, has explained the natural and genefis of logarithms agreeably to the notion of their firft inventor lord Naper. Logarithms then, and the quantities to which they correfpond, may be fuppofed to be generated by the motion of a point; and if this point moves over equal fpaces in equal times, the line defcribed by it increafes equally.

Again a line decreafes proportionably, when the point that moves over it defcribes fuch parts in equal times as are always in the fame conftant ratio to the lines from which they are fubducted, or to the diftances of that point, at the beginning of thofe lines, from a given term in that line. In like manner, a line may increafe proportionably, if in equal times the moving point defcribes fpaces proportional to its diftances from a certain term at the beginning of each time. Thus, in the firft cafe, let *a c* (Plate CIV. fig. 3.) be to *a o*, *c d* to *c o*, *d e* to *d o*, *e f* to *e o*, *f g* to *f o*, always in the fame ratio of Q R to Q S; and fuppofe the point P fets out from *a*, defcribing *a c*, *c d*, *d e*, *e f*, *f g*, in equal parts of the time; and let the fpace defcribed by P in any given time be always in the fame ratio to the diftance of P from *o* at the beginning of that time; then will the right line *a o* decreafe proportionably.

In like manner, the line *o a*, (*ibid.* n° 3.) increafes proportionally, if the point *p*, in equal times, defcribes the fpaces *a c*, *c d*, *de*, *f g*, *&c.* fo that *a c* is to *a o*, *c d* to *c o*, *de* to *d o*, *&c.* in a conftant ratio. If we now fuppofe a point P defcribing the line A G (*ibid.* n° 4.) with an uniform motion, while the point *p* defcribes a line increafing or decreafing proportionally, the line A P, defcribed by P, with this uniform motion, in the fame time that *o a*, by increafing or decreafing proportionally, becomes equal to *o p*, is the logarithm of *o p*. Thus A C, A D, A E, *&c.* are the logarithms of *o c*, *o d*, *o e*, *&c.* refpectively; and *o a* is the quantity whofe logarithm is fuppofed equal to nothing.

We have here abftracted from numbers, that the doctrine may be the more general; but it is plain, that if A C, A D, A E, *&c.* be fuppofed, 1, 2, 3, *&c.* in arithmetic progreffion; *o c*, *o d*, *o e*, *&c.* will be in geometric progreffion; and that the logarithm of *o a*, which may be taken for unity, is nothing.

Lord Naper, in his firft fcheme of logarithms, fuppofes, that while *o p* increafes or decreafes proportionally, the uniform motion of the point P, by which the logarithm of *o p* is generated, is equal to the velocity of *p* at *a*; that is, at the term of time when the logarithms begin to be generated.

generated. Hence logarithms, formed after this model, are called Naper's Logarithms, and fometimes Natural Logarithms.

When a ratio is given, the point p defcribes the difference of the terms of the ratio in the fame time. When a ratio is duplicate of another ratio, the point p defcribes the difference of the terms in a double time. When a ratio is triplicate of another, it defcribes the difference of the terms in a triple time; and fo on. Alfo, when a ratio is compounded of two or more ratios, the point p defcribes the difference of the terms of that ratio in a time equal to the fum of the times in which it defcribes the differences of the terms of the fimple ratios of which it is compounded. And what is here faid of the times of the motion of p when op increafes proportionally, is to be applied to the fpaces defcribed by P, in thofe times, with its uniform motion.

Hence the chief properties of logarithms are deduced. They are the meafures of ratios. The excefs of the logarithm of the antecedent above the logarithm of the confequent, meafures the ratio of thofe terms. The meafure of the ratio of a greater quantity to a leffer is pofitive; as this ratio, compounded with any other ratio, increafes it. The ratio of equality, compounded with any other ratio, neither increafes nor diminifhes it; and its meafure is nothing. The meafure of the ratio of a leffer quantity to a greater is negative; as this ratio, compounded with any other ratio, diminifhes it. The ratio of any quantity A to unity, compounded with the ratio of unity to A, produces the ratio of A to A, or the ratio of equality; and the meafures of thofe two ratios deftroy each other when added together; fo that when the one is confidered as pofitive, the other is to be confidered as negative. By fuppofing the logarithms of quantities greater than oa (which is fuppofed to reprefent unity) to be pofitive, and the logarithms of quantities lefs than it to be negative, the fame rules ferve for the operations by logarithms, whether the quantities be greater or lefs than oa. When op increafes proportionally, the motion of p is perpetually accelerated; for the fpaces ac, cd, de, *&c.* that are defcribed by it in any equal times that continually fucceed after each other, perpetually increafe in the fame proportion as the lines oa, oc, od, *&c.* When the point p moves from a towards o, and op decreafes proportionally, the motion of p is perpetually retarded; for the fpaces defcribed by it in any equal times that continually fucceed after each other, decreafe in this cafe in the fame proportion as op decreafes.

If the velocity of the point p be always as the diftance op, then will this line increafe or decreafe in the manner fuppofed by lord Naper; and the velocity of the point p being the fluxion of the line op, will always vary in the fame ratio as this quantity itfelf. This, we prefume, will give a clear idea of the genefis, or nature of logarithms; but for more of this doctrine, fee Maclaurin's Fluxions.

Conftruction of LOGARITHMS.

The firft makers of logarithms had in this a very laborious and difficult tafk to perform; they firft made choice of their fcale or fyftem of logarithms, that is, what fet of arithmetical progreffionals fhould anfwer to fuch a fet of geometrical ones, for this is entirely arbitrary; and they chufe the decuple geometrical progreffionals, 1, 10, 100, 1000, 10000, *&c.* and the arithmetical one, 0, 1, 2, 3, 4, *&c.* or 0,000000; 1,000000; 2,000000; 3,000000; 4,000000, *&c.* as the moft convenient. After this they were to get the logarithms of all the intermediate numbers between 1 and 10, 10 and 100, 100 and 1000, 1000 and 10000, *&c.* But firft of all they were to get the logarithms of the prime numbers 3, 5, 7, 11, 13, 17, 19, 23, *&c.* and when thefe were once had, it was eafy to get thofe of the compound numbers made up of the prime ones, by the addition or fubtraction of their logarithms.

In order to this, they found a mean proportion between 1 and 10, and its logarithm will be $\frac{1}{2}$ that of 10; and fo given, then they found a mean proportional between the number firft found and unity, which mean will be nearer to 1 than that before, and its logarithm will be $\frac{1}{2}$ of the former logarithm, or $\frac{1}{4}$ of that of 10; and having in this manner continually found a mean proportional between 1 and the laft mean, and bifected the logarithms, they at length, after finding 54 fuch means, came to a number 1.0000000000000001278191493200323442, fo near to 1 as not to differ from it fo much as $\frac{1}{100000000000000000}$dth part, and found its logarithm to be 0.0000000000000000555111512312578270 2, and 0000000000000001278191493200323 5 to be the difference whereby 1 exceeds the number of roots or mean proportionals found by extraction; and then, by means of thefe numbers, they found the logarithms of any other numbers whatfoever; and that after the following manner: between a given number, whofe logarithm is wanted, and 1, they found a mean proportional, as above, until at length a number (mixed) be found, fuch a fmall matter above 1, as to have 1 and 15 cyphers after it, which are followed by the fame number of fignificant figures; then they faid, as the laft number mentioned above is to the mean proportional thus found, fo is the logarithm above, *viz.* 0.0000000000000000555111512312578270 2, to the logarithm of the mean proportional number, fuch a fmall matter exceeding 1 as but now mentioned; and this logarithm being as often doubled as the number of mean proportionals (formed to get that number) will be the logarithm of the given number. And this was the method Mr. Briggs took to make the logarithms. But if they are to be made to only feven places of figures, which are enough for common ufe, they had only occafion to find 25 mean proportionals, or, which is the fame thing, to extract the $\frac{1}{33554432}$th root of 10. Now having the logarithms of 3, 5, and 7, they eafily got thofe of 2, 4, 6, 8 and 9; for fince $\frac{10}{5}=2$, the logarithm of 2 will be the difference of the logarithms of 10 and 5, the logarithm of 4 will be two times the logarithm of 2, the logarithm of 6 will be the fum of the logarithm of 2 and 3, and the logarithm of 9 double the logarithm of 3. So, alfo having found the logarithms of 13, 17 and 19, and alfo of 23 and 29, they did eafily get thofe of all the numbers between 10 and 30, by addition and fubtraction only; and fo having found the logarithms of other prime numbers, they got thofe of other numbers compounded of them. But

But ſince the way above hinted at, for finding the logarithms of the prime numbers is ſo intolerably laborious and troubleſome, the more ſkilful mathematicians that came after the firſt inventors, employing their thoughts about abbreviating this method, had a vaſtly more eaſy and ſhort way offered to them from the contemplation and menſuration of hyperbolic ſpaces contained between the portions of an aſymptote, right lines perpendicular to it, and the curve of the hyperbola: for if ECN (Plate CIII. fig. 6. n° 1.) be an hyperbola, and AD, AQ the aſymptotes, and AB, AP, AQ, *&c.* taken upon one of them, be repreſented by numbers, and the ordinates BC, PM, QN, *&c.* be drawn from the ſeveral points B, P, Q, *&c.* to the curve, then will the quadrilinear ſpaces BCMP, PMNQ, *&c. viz.* their numerical meaſures be the logarithms of the quotients of the diviſion of AB by AP, AP by AQ. *&c.* ſince when AB, AP, AQ, *&c.* are continual proportionals, the ſaid ſpaces are equal, as is demonſtrated by ſeveral writers concerning conic ſections. See HYPERBOLA.

Having ſaid that theſe hyperbolic ſpaces, numerically expreſſed, may be taken for logarithms, we ſhall next give a ſpecimen, from the great Sir Iſaac Newton, of the method how to meaſure theſe ſpaces, and conſequently of the conſtruction of logarithms.

Let CA (*ibid.* n° 2.) $=$AF be $=1$, and AB$=$A$b=x$; then will $\frac{1}{1+x}$ be $=$BD, and $\frac{1}{1-x}=bd$; and putting theſe expreſſions into ſerieſes, it will be $\frac{1}{1+x}=1-x+x^2-x^3+x^4-x^5$, *&c.* and $\frac{1}{1-x}=1+x+x^2+x^3+x^4+x^5$, *&c.* and $\frac{\dot{x}}{1+x}=\dot{x}-x\dot{x}+x^2\dot{x}-x^3\dot{x}+x^4\dot{x}-x^5\dot{x}$, *&c.* and $\frac{\dot{x}}{1-x}=\dot{x}+x\dot{x}+x^2\dot{x}+x^3\dot{x}+x^4\dot{x}+x^5\dot{x}$, *&c.* and taking the fluents, we ſhall have the area AFDB $=x-\frac{xx}{2}+\frac{x^3}{3}-\frac{x^4}{4}+\frac{x^5}{5}$, *&c.* and the area AF*db*, $=x+\frac{xx}{2}+\frac{x^3}{3}+\frac{x^4}{4}+\frac{x^5}{5}$, *&c.* and the ſum *bd*DB$=2x+\frac{2x^3}{3}+\frac{2}{5}x^5+\frac{2}{7}x^7+\frac{2}{9}x^9$, *&c.* Now if AB or *ab* be $\frac{1}{10}=x$, C*b* being$=0.9$, and CB$=1.1$, by putting this value of x in the equations above, we ſhall have the area *bd* DB$=$0.2006706954621511 for the terms of the ſeries will ſtand as you ſee in this table,

0.2000000000000000	= firſt	Term of the ſeries.
6666666666666	= ſecond	
40000000000	= third	
285714286	= fourth	
2222222	= fifth	
18182	= fixth	
154	= ſeventh	
1	= eighth	
0.2006706954621511		

If the parts A*d* and AD of this area be added ſeparately, and the leſſer DA be taken from the greater *d*A, we ſhall have A*d*—AD$=x^2+\frac{x^4}{2}+\frac{x^6}{3}+\frac{x^8}{4}$, *&c.* $=$0.0100503358535014, for the terms reduced to decimals will ſtand thus:

0.0100000000000000	= firſt	Term of the ſeries.
50000000000	= ſecond	
3333333333	= third	
25000000	= fourth	
200000	= fifth	
1667	= fixth	
14	= ſeventh	
0.0100503358535014.		

Now if this difference of the areas be added to, and ſubtracted from their ſum before found, half the agregate, *viz.* 0.1053605156578263 will be the greater area A*d*, and half the remainder, *viz.* 0.0953101798043249, will be the leſſer area AD.

By the ſame tables, theſe areas AD and A*d*, will be obtained alſo when AB$=$A*b* are ſuppoſed to be $\frac{1}{100}$ or CB$=$1.01, and C*b*$=$0.99, if the numbers are but duly transferred to lower places, as

0.0200000000000000	= firſt	Term of the ſeries.
6666666666	= ſecond	
400000	= third	
28	= fourth	
Sum$=$0.0200006667066694	= area *b*D.	

0.0001000000000000	= firſt	Term of the ſeries.
50000000	= ſecond	
3333	= third	
0.0001000050003333	= area A*d*—AD.	

Half the agregate 0.0100503358535014$=$A*d*, and half the remainder, *viz.*0.0099503308531681$=$AD.

And ſo putting AB$=$A*b*$=\frac{1}{1000}$, or CB$=$1.001 and C*b*$=$0.999, there will be obtained A*d*$=$0.0010005000333583 5, and AD$=$0.0009995001333083 5.

After the ſame manner, if AB$=$A*b*, be $=$0.2, or 0.02, or 0.002, theſe areas will ariſe.

A*d*$=$0.2231435513142097, and
AD$=$0.1823215576939546, or
A*d*$=$0.0202027073175194, and
AD$=$0.1098026272961797, or
A*d*$=$0.002002, and AD$=$0.001.

From theſe areas thus found, others may be eaſily had from addition and ſubtraction only. For ſince $\frac{1.2}{0.8}\times\frac{1.2}{0.9}=2$, the ſum of the areas belonging to the ratios $\frac{1.2}{0.8}$ and $\frac{1.2}{0.9}$ (that is, inſiſting upon the parts of the abſciſs 1.2, 0.8; and 1.2, 0.9) *viz.*

0.405465, *&c.* and $\left\{\begin{array}{l}\text{AD}=0.18232, \textit{\&c.}\\ \text{A}d=0.10536, \textit{\&c.}\end{array}\right.$

Sum$=$0.28768, *&c.*

added thus, $\left\{\begin{array}{l}0.40546, \textit{\&c.}\\ 0.28768, \textit{\&c.}\end{array}\right.$

Total$=$0.69314, *&c.* $=$ the area of AFHG, when

when CG is $=2$. Alſo, ſince $\frac{1.2}{0.8}\times 2=3$, the ſum 1.0986122, *&c.* of the areas belonging to $\frac{1.2}{0.8}$, and 2, will be the area of AFGH, when CG=3. Again, ſince $\frac{2\times 2}{0.8}=5$, and $2\times 5=10$; by adding Ad=0.2231, *&c.* AD=0.1823, *&c.* and Ad=0.1053, *&c.* together, their ſum is 0.5108, *&c.* and this added to 1.0986, *&c.* the area of AFGH, when CG=3. You will have 1.6093379124341004=AFGH, when CG is 5; and adding that of 2 to this, gives 2.3025850929940457 =AFGH, when CG is equal to 10: and ſince $10\times 10=100$; and $10\times 100=1000$; and $\sqrt{5\times 10\times 0.98}=7$, and $10\times 1.1=11$, and $\frac{1000\times 1.091}{7\times 11}=13$, and $\frac{1000\times 0.998}{2}=499$; it is plain that the area AFGH may be found by the compoſition of the areas found before, when CG=100, 1000, or any other of the numbers above mentioned; and all theſe areas are the hyperbolic logarithms of thoſe ſeveral numbers.

Having thus obtained the hyperbolic logarithms of the numbers 10, 0.98, 0.99, 1.01, 1.02; if the logarithms of the four laſt of them be divided by the hyperbolic logarithm 2.3025850, *&c.* of 10, and the index 2, be added; or, which is the ſame thing, if it be multiplied by its reciprocal 0.4342944819032518, the value of the ſubtangent of the logarithmic curve, to which Briggs's logarithms are adapted, we ſhall have the true tabular logarithms of 98, 99, 100, 101, 102. Theſe are to be interpolated by ten intervals, and then we ſhall have the logarithms of all the numbers between 980 and 1020; and all between 980 and 1000, being again interpolated by ten intervals, the table will be as it were conſtructed. Then from theſe we are to get the logarithms of all the prime numbers, and their multiples leſs than 100, which may be done by addition and ſubtraction only: for $\frac{\sqrt[10]{84\times 1020}}{9945}=2$; $\frac{\sqrt[4]{8\times 9963}}{984}=3$; $\frac{10}{2}=5$; $\frac{\sqrt{98}}{2}=7$; $\frac{99}{9}=11$; $\frac{1001}{7\times 11}=13$; $\frac{102}{6}=17$; $\frac{988}{4\times 13}=19$; $\frac{9936}{16\times 27}=23$; $\frac{986}{2\times 17}=29$; $\frac{992}{32}=31$; $\frac{999}{27}=37$; $\frac{984}{24}=41$; $\frac{989}{23}=43$; $\frac{987}{21}=47$; $\frac{9911}{11\times 17}=53$; $\frac{9971}{13\times 13}=59$; $\frac{9882}{2\times 81}=61$; $\frac{9949}{3\times 49}=67$; $\frac{994}{14}=71$; $\frac{9928}{8\times 17}=73$; $\frac{9954}{7\times 18}=79$; $\frac{996}{12}=83$; $\frac{9968}{7\times 16}=89$; $\frac{9894}{6\times 17}=97$; and thus having the logarithms of all the numbers leſs than 100, you have nothing to do but interpolate the ſeveral times, through ten intervals.

Now the void places may be filled up by the following theorem. Let n be a number, whoſe logarithm is wanted; let x be the difference between that and the two neareſt numbers, equally diſtant on each ſide, whoſe logarithms are already found; and let d be half the difference of their logarithms: then the required logarithm of the number n, will be had by adding $d+\frac{dx}{2n}+\frac{dx^3}{12n^3}$, *&c.* to the logarithm of the leſſer number; for if the numbers are repreſented by C*p*, CG, CP, (*ibid.* n° 2.) and the ordinates *ps*, PQ, be raiſed; if n be wrote for CG, and x for GP, or G*p*, the area *ps*QP, or $\frac{2x}{n}+\frac{x^2}{2n^2}+\frac{x^3}{3n^3}$, *&c.* will be to the area *ps*HG, as the difference between the logarithms of the extreme numbers, or $2d$, is to the difference between the logarithms of the leſſer, and of the middle one; which, therefore, will be

$$\frac{\frac{dx}{n}+\frac{dx^2}{2n}+\frac{dx^3}{3n}, \text{\&c.}}{\frac{x}{n}+\frac{x^3}{3n}+\frac{x^5}{5n}, \text{\&c.}}=d+\frac{dx}{2n}+\frac{dx^3}{12n^3}, \text{\&c.}$$

The two firſt terms $d+\frac{dx}{2n}$ of this ſeries, being ſufficient for the conſtruction of a canon of logarithms, even to 14 places of figures, provided the number, whoſe logarithm is to be found, be leſs than 1000; which cannot be very troubleſome, becauſe x is either 1 or 2: yet it is not neceſſary to interpolate all the places by help of this rule, ſince the logarithms of numbers, which are produced by the multiplication or diviſion of the number laſt found, may be obtained by the numbers whoſe logarithms were had before, by the addition or ſubtraction of their logarithms. Moreover, by the difference of their logarithms, and by their ſecond and third differences, if neceſſary, the void places may be ſupplied more expeditiouſly; the rule afore-going being to be applied only where the continuation of ſome full places is wanted, in order to obtain theſe differences.

By the ſame method rules may be found for the intercalation of logarithms, when of three numbers the logarithm of the leſſer and of the middle number are given, or of the middle number and the greater; and this although the numbers ſhould not be in arithmetical progreſſion. Alſo by purſuing the ſteps of this method, rules may be eaſily diſcovered for the conſtruction of artificial ſines and tangents, without the help of the natural tables. Thus far the great Newton, who ſays, in one of his letters to Mr Leibnitz, that he was ſo much delighted with the conſtruction of logarithms, at his firſt ſetting out in thoſe ſtudies, that he was aſhamed to tell to how many places of figures he had carried them at that time: and this was before the year 1666; becauſe, he ſays, the plague made him lay aſide thoſe ſtudies, and think of other things.

Dr. Keil, in his Treatiſe of Logarithms, at the end of his Commandine's Euclid, gives a ſeries, by means of which may be found eaſily and expeditiouſly the logarithms of large numbers. Thus, let z be an odd number, whoſe logarithm is ſought: then ſhall the numbers $z-1$ and $z+1$ be even, and accordingly their logarithms, and the difference of the logarithms will be had, which let be called y. Therefore, alſo the logarithm of a number, which is a geometrical mean between $z-1$ and $z+1$, will

will be given, *viz.* equal to half the ſum of the logarithms.

Now the ſeries $y\times\frac{1}{4z}+\frac{1}{24z^3}+\frac{181}{15120z^7}+\frac{25200z^9}{13}$, *&c.* ſhall be equal to the logarithm of the ratio, which the geometrical mean between the numbers $z-1$ and $z+1$, has to the arithmetical mean, *viz.* to the number z. If the number exceeds 1000, the firſt term of the ſeries, *viz.* $\frac{y}{4z}$, is ſufficient for producing the logarithm to 13 or 14 places of figures, and the ſecond term will give the logarithm to 20 places of figures. But if z be greater than 10000, the firſt term will exhibit the logarithm to 18 places of figures; end ſo this ſeries is of great uſe in filling up the chiliads omitted by Mr Briggs. For example, it is required to find the logarithm of 20001; the logarithm of 20000 is the ſame as the logarithm of 2, with the index 4 prefixed to it; and the difference of the logarithms of 20000 and 20001, is the ſame as the difference of the logarithms of the numbers 10000 and 10001, *viz.* 0.0000434272, *&c.* And if this difference be divided by $4z$, or 80004, the quotient $\frac{y}{4z}$ ſhall be

0.000000000542813; and if the logarithm of the geometrical mean, *viz.*
4.301051709302416 be added to the quotient, the ſum will be

4.301051709845230= the logarithm of 20001.

Wherefore it is manifeſt that to have the logarithm to 14 places of figures, there is no neceſſity of continuing out the quotient beyond 6 places of figures. But if you have a mind to have the logarithm to 10 places of figures only, the two firſt figures are enough. And if the logarithms of the numbers above 20000 are to be found by this way, the labour of doing them will moſtly conſiſt in ſetting down the numbers. This ſeries is eaſily deduced from the conſideration of the hyperbolic ſpaces aforeſaid. The firſt figure of every logarithm towards the left hand, which is ſeparated from the reſt by a point, is called the index of that logarithm; becauſe it points out the higheſt or remoteſt place of that number from the place of unity in the infinite ſcale of proportionals towards the left hand: thus, if the index of the logarithm be 1. it ſhews that its higheſt place towards the left hand is the tenth place from unity; and therefore all logarithms which have 1 for their index, will be found between the tenth and hundredth place, in the order of numbers. And for the ſame reaſon all logarithms which have 2 for their index, will be found between the hundredth and thouſandth place, in the order of numbers, *&c* Whence univerſally the index or characteriſtic of any logarithm is always leſs by one than the number of figures in whole numbers, which anſwer to the given logarithm; and, in decimals, the index is negative.

As all ſyſtems of logarithms whatever, are compoſed of ſimilar quantities, it will be eaſy to form, from any ſyſtem of logarithms, another ſyſtem in any given ratio; and conſequently to reduce one table of logarithms into another of any given form. For as any one logarithm in the given form, is to its correſpondent logarithm in another form; ſo is any other logarithm in the given form, to its correſpondent logarithm in the required form; and hence we may reduce the logarithms of lord Napier into the form of Briggs's, and contrariwiſe. For as 2.302585092, *&c.* lord Napier's logarithm of 10, is to 1.0000000000, Mr Briggs's logarithm of 10; ſo is any other logarithm in lord Napier's form, to the correſpondent tabular logarithm in Mr Briggs's form; and becauſe the two firſt numbers conſtantly remain the ſame; if lord Napier's logarithm of any one number be divided by 2.302585, *&c.* or multiplied by 4342944, *&c.* the ratio of 1.0000, *&c.* to 2.30258, *&c.* as is found by dividing 1.00000, *&c.* by 2.30258, *&c.* the quotient in the former, and the product in the latter, will give the correſpondent logarithm in Briggs's form, and the contrary. And, after the ſame manner, the ratio of natural logarithms to that of Briggs's, will be found=868588963806.

The uſe and application of LOGARITHMS.

It is evident, from what has been ſaid of the conſtruction of logarithms, that addition of logarithms muſt be the ſame thing as multiplication in common arithmetick; and ſubſtraction in logarithms the ſame as diviſion: therefore, in multiplication by logarithms, add the logarithms of the multiplicand and multiplier together, their ſum is the logarithm of the product.

		num.	logarithms.
Example.	Multiplicand	8.5	0.1294189
	Multiplier	10	1.0000000
	Product	85	1.9294189

And in diviſion, ſubtract the logarithm of the diviſor from the logarithm of the dividend, the remainder is the logarithm of the quotient.

		num.	logarithms.
Example.	Dividend	9712 8	3.9873444
	Diviſor	456	2.6589648
	Quotient	21.3	1.3283796

To find the complement of a LOGARITHM.

Begin at the left hand, and write down what each figure wants of 9, only what the laſt ſignificant figure wants of 10; ſo the complement of the logarithm of 456, *viz.* 2.6589648, is 7.3410352.

In the rule of three. Add the logarithms of the ſecond and third terms together, and from the ſum ſubtract the logarithm of the firſt, the remainder is the logarithm of the fourth. Or, inſtead of ſubtracting a logarithm, add its complement, and the reſult will be the ſame.

To raiſe powers by LOGARITHMS.

Multiply the logarithm of the number given, by the index of the power required, the product will be the logarithm of the power ſought.

Example. Let the cube of 32 be required by logarithms. The logarithm of 32=1.5051500. which multiplied by 3, is 4.5154500, the logarithm of 32768, the cube of 32. But in raiſing powers, *viz.* ſquaring, cubing,

-bing, *&c.* of any decimal fraction by logarithms, it muſt be obſerved, that the firſt ſignificant figure of the power be put ſo many places below the place of units, as the index of its logarithm wants of 10, 100, *&c.* multiplied by the index of the power.

To extract the roots of powers by LOGARITHMS.

Divide the logarithm of the number by the index of the power, the quotient is the logarithm of the root ſought.

To find mean proportionals between any two numbers.

Subtract the logarithm of the leaſt term from the logarithm of the greateſt, and divide the remainder by a number more by one than the number of means deſired; then add the quotient to the logarithm of the leaſt term (or ſubtract it from the logarithm of the greateſt) continually, and it will give the logarithms of all the mean proportionals required.

Example. Let three mean proportionals be ſought, between 106 and 100.

Logarithm of 106 = 2.0253058
Logarithm of 100 = 2.0000000

Divide by 4)0.0253059(0.0063264.75

Logarithm of the leaſt term 100 added		2.0000000
Logarithm of the firſt mean	101.4673846	2.0063264.75
Logarithm of the ſecond mean	102.9563014	2.0126529.5
Logarithm of the third mean	104 4670483	2.0189794.25
Logarithm of the greateſt term	106	2.0253059.

L O G I C.

LOGIC, the art of thinking and reaſoning juſtly; or, it may be defined the ſcience or hiſtory of the human mind, inaſmuch as it traces the progreſs of our knowledge from our firſt and moſt ſimple through all their different combinations, conceptions, and all thoſe numerous deductions that reſult from variouſly comparing them one with another.

The preciſe buſineſs of logic, therefore, is to explain the nature of the human mind, and the proper manner of conducting its ſeveral powers, in order to the attainment of truth and knowledge. It lays open thoſe errors and miſtakes we are apt, through inattention, to run into; and teaches us how to diſtinguiſh between truth, and what only carries the appearance of it. By this means we grow acquainted with the nature and force of the underſtanding; ſee what things lie within its reach; where we may attain certainty and demonſtration; and when we muſt be contented with probability.

This ſcience is generally divided into four parts, *viz. Perception*, *Judgment*, *Reaſoning*, and *Method*. This diviſion comprehends the whole hiſtory of the ſenſations and operations of the human mind. But we muſt refer the reader for the firſt part, *viz. Perception*, and *Ideas*, to METAPHYSICS, where it will be more conveniently and fully treated, and confine ourſelves in this place to the three laſt, *viz. Judgment*, *Reaſoning*, *and Method*.

PART I. *Of* JUDGMENT.

THE mind being furniſhed with ideas, its next ſtep in the way to knowledge is, the comparing theſe ideas together, in order to judge of their agreement or diſagreement. In this joint view of our ideas, if the relation is ſuch, as to be immediately diſcoverable by the bare inſpection of the mind; the judgments thence obtained are called *intuitive*; for in this caſe, a mere attention to the ideas compared, ſuffices to let us ſee, how far they are connected or disjoined. Thus, *that the whole is greater than any of its parts*, is an intuitive judgment, nothing more being required to convince us of its truth, than an attention to the ideas of *whole* and *part*, And this too is the reaſon, why we call the act of the mind forming theſe judgments, *intuition*; as it is indeed no more, than an immediate perception of the agreement or diſagreement of any two ideas.

But it is to be obſerved, that our knowledge of this kind reſpects only our ideas, and the relations between them; and therefore can ſerve only as a foundation to ſuch reaſonings as are employed in inveſtigating theſe relations. Now many of our judgments are converſant about facts, and the real exiſtence of things, which cannot be traced by the bare contemplation of our ideas. It does not follow, becauſe I have the idea of a circle in my mind, that therefore a figure anſwering to that idea, has a real exiſtence in nature. I can form to myſelf the notion of a centaur, or golden mountain, but never imagine on that account, that either of them exiſt. What then are the grounds of our judgment in relation to facts? *Experience* and *teſtimony*. By *experience* we are informed of the exiſtence of the ſeveral objects which ſurround us, and operate upon our ſenſes. *Teſtimony* is of a wider extent, and reaches not only to objects beyond the preſent ſphere of our obſervation, but alſo to facts and

and tranfactions, which being now paft, and having no longer any exiftence, could not without this conveyance, have fallen under our cognizance.

Here then we have three foundations of human judgment, from which the whole fyftem of our knowledge may with eafe and advantage be derived. Firft, *intuition*, which refpects our ideas themfelves, and their relations, and is the foundation of that fpecies of reafoning, which we call *demonftration*. For whatever is deduced from our intuitive perceptions, by a clear and connective feries of proofs, is faid to be demonftrated, and produces abfolute certainty in the mind. Hence the knowledge obtained in this manner, is what we properly term *fcience*; becaufe in every ftep of the procedure, it carries its own evidence along with it, and leaves no room for doubt or hefitation. And, what is highly worthy of notice, as the truths of this clafs exprefs the relations between our ideas, and the fame relations muft ever and invariably fubfift between the fame ideas, our deductions in the way of fcience, conftitute what we call eternal, neceffary, and immutable truths. If it be true that the whole is equal to all its parts, it muft be fo unchangeably; becaufe the relation of equality being attached to the ideas themfelves, muft ever intervene where the fame ideas are compared. Of this nature are all the truths of natural religion, morality, and mathematicks, and in general, whatever may be gathered from the bare view and confideration of our ideas.

The fecond ground of human judgment is *experience;* from which we infer the exiftence of thofe objects that furround us, and fall under the immediate notice of our fenfes. When we fee the fun, or caft our eyes towards a building, we not only have ideas of thefe objects within ourfelves, but afcribe to them a real exiftence out of the mind. It is alfo by the information of the fenfes, that we judge of the qualities of bodies; as when we fay that fnow is white, fire hot, or fteel hard. For as we are wholy unacquainted with the internal ftructure and conftitution of the bodies that produce thefe fenfations in us, and are unable to trace any connection between that ftructure and the fenfations themfelves, it is evident, that we build our judgments altogether upon obfervation, afcribing to bodies fuch qualities, as are anfwerable to the perceptions they excite in us. But this is not the only advantage derived from experience; for we are likewife indebted to it for all our knowledge regarding the coexiftence of fenfible qualities in objects, and the operations of bodies one upon another. Ivory, for inftance, is hard and elaftic; this we know by experience, and indeed by that alone. For being altogether ftrangers to the true nature both of elafticity and hardnefs, we cannot by the bare contemplation of our ideas determine, how far the one neceffarily implies the other, or whether there may not be a repugnance between them. But when we obferve them to exift both in the fame object, we are then affured from experience, that they are not incompatible; and when we alfo find that a ftone is hard and not elaftic, and that air though elaftic is not hard, we alfo conclude upon the fame foundation, that the ideas are not neceffarily conjoined; but may exift feparately in different objects. In like manner with regard to the operations of bodies one upon another, it is evident, that our knowledge this way, is all derived from obfervation. *Aqua regia* diffolves gold, as has been found by frequent trial, nor is there any other way of arriving at the difcovery. Naturalifts may tell us if they pleafe, that the parts of *aqua regia* are of a texture apt to infinuate between the corpufcles of gold, and thereby loofen and fhake them afunder. If this is a true account of the matter, we believe it will notwithftanding be allowed, that our conjecture in regard to the conformation of thefe bodies is deduced from the experiment, and not the experiment from the conjecture. It was not from any previous knowledge of the intimate ftructure of *aqua regia* and *gold*, and the aptnefs of their parts to act or be acted upon, that we came by the conclufion above mentioned. The internal conftitution of bodies is in a manner wholly unknown to us, and could we even furmount this difficulty, yet as the feparation of the parts of gold, implies fomething like an active force in the *menftruum*, and we are unable to conceive how it comes to be poffeffed of this activity; the effect muft be owned to be altogether beyond our comprehenfion. But when repeated trials had once confirmed it, infomuch that it was admitted as an eftablifhed truth in natural knowledge, it was then eafy for men, to fpin out theories of their own invention, and contrive fuch a ftructure of parts, both for *gold* and *aqua regia*, as would beft ferve to explain the phænomenon, upon the principles of that fyftem of philofophy they had adopted.

From what has been faid it is evident, that as intuition is the foundation of what we call *fcientifical* knowledge, fo is experience of *natural*. For this laft, being wholly taken up with objects of fenfe, or thofe bodies that conftitute the natural world; and their properties, as far as we can difcover them, being to be traced only by a long and painful feries of obfervations, it is apparent, that in order to improve this branch of knowledge, we muft betake ourfelves to the method of trial and experiment.

But though experience is what we may term the immediate foundation of natural knowledge, yet with refpect to particular perfons, its influence is very narrow and confined. The bodies that furround us are numerous, many of them lie at a great diftance, and fome quite beyond our reach. Life too is fhort, and fo crouded with cares, that but little time is left for any fingle man to employ himfelf in unfolding the myfteries of nature. Hence it is neceffary to admit many things upon the teftimony of others, which by this means becomes the foundation of a great part of our knowledge of body. No man doubts of the power of *aqua regia* to diffolve gold, though perhaps he never himfelf made the experiment. In thefe therefore and fuch like cafes, we judge of the facts and operations of nature, upon the mere ground of teftimony. However, as we can always have recourfe to experience, where any doubt or fcruple arifes, this is juftly confidered as the true foundation of natural philofophy; being indeed the ultimate fupport upon which our affent refts, and whereto we appeal, when the higheft degree of evidence is required.

But there are many facts that will not allow of an appeal to the fenfes, and in this cafe teftimony is the true and

and only foundation of our judgments. All human actions of whatever kind, when confidered as already paft, are of the nature here defcribed; becaufe having now no longer any exiftence, both the facts themfelves, and the circumftances attending them, can be known only from the relations of fuch as had fufficient opportunities of arriving at the truth. *Teftimony* therefore is juftly accounted a third ground of human judgment; and as from the other two we have deduced *fcientifical* and *natural* knowledge, fo may we from this derive *hiftorical;* by which we mean, not merely a knowledge of the civil tranfactions of ftates and kingdoms, but of all facts whatfoever, where teftimony is the ultimate foundation of our belief.

Of affirmative and negative propofitions.

WHILE the comparing of our ideas, is confidered merely as an act of the mind, affembling them together, and joining or disjoining them according to the refult of its preceptions, we call it *judgment*; but when our judgments are put into words, they then bear the name of *propofitions*. A propofition therefore is a fentence expreffing fome judgment of the mind, whereby two or more ideas are affirmed to agree or difagree. Now as our judgments include at leaft two ideas, one of which is affirmed or denied of the other, fo muft a propofition have terms anfwering to thefe ideas. The idea of which we affirm or deny, and of courfe the term expreffing that idea, is called the *fubject* of the propofition. The idea affirmed or denied, as alfo the term anfwering it is called the *predicate*. Thus in the propofition, *God is omnipotent: God* is the fubject, it being of him that we affirm omnipotence; and *omnipotent* is the predicate, becaufe we affirm the idea expreffed by that word to belong to God.

But as in propofitions, ideas are either joined or disjoined; it is not enough to have terms expreffing thofe ideas, unlefs we have alfo fome words to denote their agreement or difagreement. That word in a propofition which connects two ideas together, is called the *copula*; and if a negative particle be annexed, we thereby underftand that the ideas are disjoined. The *fubftantive verb*, is commonly made ufe of for the copula, as in the abovementioned propofition, *God is omnipotent;* where *is* reprefents the copula, and fignifies the agreement of the ideas of *God* and *omnipotence*. But if we mean to feparate two ideas: then, befides the fubftantive verb, we muft alfo ufe fome particle of negation, to exprefs this repugnance. The propofition, *Man is not perfect;* may ferve as an example of this kind, where the notion of *perfection*, being removed from the idea of *man*, the negative particle *not* is inferted after the copula, to fignify the difagreement between the fubject and predicate.

Every propofition neceffarily confifts of thefe three parts, but then it is not alike needful that they be all feverally expreffed in words; becaufe the copula is often included in the term of the predicate, as when we fay, *He fits;* which imports the fame as *he is fitting*. In the *Latin* language, a fingle word has often the force of a whole fentence. Thus, *ambulat* is the fame as *ille eft ambulans*; *amo*, as *ego fum amans*, and fo in innumerable other inftances; by which it appears, that we are not fo much to regard the number of words in a fentence, as the ideas they reprefent, and the manner in which they are put together. For where ever two ideas are joined or disjoined in an expreffion, though of but a fingle word, it is evident that we have a fubject, predicate, and copula, and of confequence a complete propofition.

When the mind joins two ideas, we call it an *affirmative* judgment; when it feparates them, a *negative*; and as any two ideas compared together, muft neceffarily either agree or not agree, it is evident, that all our judgments fall under thefe two divifions. Hence likewife, the propofitions expreffing thefe judgments, are all either affirmative or negative.

Hence we fee the reafon of the rule commonly laid down by logicians; that in all negative propofitions, the negation ought to affect the copula. For as the copula, when placed by itfelf, between the fubject and the predicate, manifeftly binds them together; it is evident, that in order to render a propofition negative, the particle of negation muft enter it in fuch manner, as to deftroy this union. In a word, then only are two ideas disjoined in a propofition, when the negative particle may be fo referred to the copula, as to break the affirmation included in it, and undo that connection it would otherwife eftablifh. When we fay, for inftance, *No man is perfect*; take away the negation, and the copula of itfelf plainly unites the ideas in the propofition. On the contrary, in this fentence; *The man who departs not from an upright behaviour, is beloved of God*; the predicate *beloved of God*, is evidently affirmed of the fubject *an upright man*; fo that notwithftanding the negative particle, the propofition is ftill affirmative. The reafon is plain; the negation here affects not the copula, but making properly a part of the fubject, ferves with other terms in the fentence, to form one complex idea, of which the predicate *beloved of God*, is directly affirmed.

Of univerfal and particular propofitions.

THE next confiderable divifion of propofition, is into *univerfal and particular*. Our ideas, are all fingular as they enter the mind, and reprefent individual objects. But as by abftraction we can render them univerfal, fo as to comprehend a whole clafs of things, and fometimes feveral claffes at once; hence the terms expreffing thefe ideas, muft be in like manner univerfal. (See METAPHYSICS.) If therefore we fuppofe any general term to become the fubject of a propofition, it is evident, that whatever is affirmed of the abftract idea belonging to that term, may be affirmed of all the individuals to which that idea extends. Thus when we fay, *Men are mortal;* we confider mortality, not as confined to one or any number of particular men, but as what may be affirmed without reftriction of the whole fpecies. By this means the propofition becomes as general as the idea which makes the fubject of it, and indeed derives its univerfality entirely from that idea, being more or lefs fo, according as this may be extended to more or fewer individuals. But thefe general terms fometimes enter a propofition in their full latitude, as in the example given above; and fometimes appear with a mark of limitation. In this laft cafe we are given to underftand, that the predicate agrees not to the whole univerfal idea, but only to a part of it; as in the propofition,

propofition, *fome men are wife:* for here wifdom is not affirmed of every particular man, but reftrained to a few of the human fpecies.

Now from this different appearance of the general idea, that conftitutes the fubject of any judgment, arifes the divifion of propofitions into *univerfal* and *particular*. An *univerfal* propofition is that wherein the fubject is fome general term, taken in its full latitude, infomuch that the predicate agrees to all the individuals comprehended under it, if it denotes a proper fpecies; and to all the feveral fpecies, and their individuals, if it marks an idea of a higher order. The words *all, every, no, none,* &c. are the proper figns of this univerfality; and as they feldom fail to accompany general truths, fo they are the moft obvious criterion whereby to diftinguifh them. *All animals have a power of beginning motion.* This is an univerfal propofition; as we know from the word *all*, prefixed to the fubject *animal*, which denotes that it muft be taken in its full extent. Hence the power of beginning motion, may be affirmed of all the feveral fpecies of animals.

A *particular* propofition has in like manner fome general term for its fubject, but with a mark of limitation added, to denote, that the predicate agrees only to fome of the individuals comprehended under a fpecies, or to one or more of the fpecies belonging to any genus, and not to the whole univerfal idea. Thus, *fome ftones are heavier than iron; fome men have an uncommon fhare of prudence.* In the laft of thefe propofitions, the fubject *fome men*, implies only a certain number of individuals, comprehended under a fingle fpecies. In the former, where the fubject is a genus, that extends to a great variety of diftinct claffes, *fome ftones* may not only imply any number of particular ftones, but alfo feveral whole fpecies of ftones; inafmuch as there may be not a few, with the property there defcribed. Hence we fee, that a propofition does not ceafe to be particular, by the predicate's agreeing to a whole fpecies, unlefs that fpecies fingly and diftinctly confidered, makes alfo the fubject of which we affirm or deny.

There is ftill one fpecies of propofitions that remains to be defcribed; and which the more deferve our notice, as it is not yet agreed among logicians to which of the two claffes mentioned above they ought to be referred, I mean *fingular* propofitions; or thofe where the fubject is an individual. Of this nature are the following: *Sir* Ifaac Newton *was the inventor of fluxions; This book contains many ufeful truths.* What occafions fome difficulty, as to the proper rank of thefe propofitions, is, that the fubject being taken according to the whole of its extenfion, they fometimes have the fame effect in reafoning, as univerfals. But if it be confidered, that they are in truth the moft limited kind of particular propofitions, and that no propofition can with any propriety be called univerfal, but where the fubject is fome univerfal idea; we fhall not be long in determining to which clafs they ought to be referred. When we fay, *Some books contain ufeful truths*; the propofition is particular, becaufe the general term appears with a mark of reftriction. If therefore we fay, *This book contains ufeful truths*; it is evident that the propofition muft be ftill more particular, as the limitation implied in the word *this* is of a more confined nature than in the former cafe.

We fee therefore, that all propofitions are either *affirmative* or *negative*; nor is it lefs evident, that in both cafes they may be *univerfal* or *particular*. Hence arifes that celebrated fourfold divifion of them, into *univerfal, affirmative*, and *univerfal negative*; *particular affirmative*, and *particular negative*; which comprehends indeed all their varieties. The ufe of this method of diftinguifhing them will appear more fully afterwards, when we come to treat of reafoning and fyllogifm.

Of abfolute and conditional propofitions.

THE objects about which we are chiefly converfant in this world, are all of a nature liable to change. What may be affirmed of them at one time, cannot often at another; and it makes no fmall part of our knowledge, to diftinguifh rightly thefe variations, and trace the reafons upon which they depend. For it is obfervable, that amidft all the viciffitudes of nature, fome things remain conftant and invariable; nor are even the changes, to which we fee others liable, effected, but in confequence of uniform and fteady laws, which when known, are fufficient to direct us in our judgments about them. Hence philofophers, in diftinguifhing the objects of our perception into various claffes, have been very careful to note, that fome properties belong effentially to the general idea, fo as not to be feparable from it, but by deftroying its very nature: while others are only accidental, and may be affirmed or denied of it in different circumftances. Thus, folidity, a yellow colour, and great weight, are confidered as effential qualities of gold; but whether it fhall exift as an uniform conjoined mafs, is not alike neceffary. We fee that, by a proper menftruum, it may be reduced to a fine powder; and that intenfe heat will bring it into a ftate of fufion.

From this diverfity in the feveral qualities of things, arifes a confiderable difference as to the manner of our judging about them. For all fuch properties as are infeparable from objects, when confidered as belonging to any genus or fpecies, are affirmed abfolutely and without referve of that general idea. Thus we fay, *Gold is very weighty, a ftone is hard, animals have a power of felf-motion.* But in the cafe of mutable or accidental qualities, as they depend upon fome other confideration, diftinct from the general idea; that alfo muft be taken into the account, in order to form an accurate judgment. Should we affirm, for inftance, of fome ftones, that they are very fufceptible of a rolling motion; the propofition while it remains in the general form, cannot with any advantage be introduced into our reafonings. An aptnefs to receive that mode of motion, flows from the figure of the ftone; which, as it may vary infinitely, our judgment then only becomes applicable and determinate, when the particular figure, of which volubility is a confequence, is alfo taken into the account. Let us then bring in this other confideration, and the propofition will run as follows: *Stones of a fpherical form, are eafily put into a rolling motion.* Here we fee the condition upon which the predicate is affirmed, and therefore know in what particular cafes the propofition may be applied.

This confideration of propofitions, refpecting the manner in which the predicate is affirmed of the fubject, gives rife to the divifion of them into *abfolute* and *conditional*. *Abfolute* propofitions are thofe, wherein we affirm fome property infeparable from the idea of the fubject, and which therefore belongs to it in all poffible cafes; as, *God is infinitely wife. Virtue tends to the ultimate happinefs of man.* But where the predicate is not neceffarily connected with the idea of the fubject, unlefs upon fome confideration diftinct from that idea, there the propofition is called *conditional*. The reafon of the name is taken from the fuppofition annexed, which is of the nature of a condition, and may be expreffed as fuch. Thus, *If a ftone is expofed to the rays of the fun, it will contract fome degree of heat. If a river runs in a very declining channel, its rapidity will conftantly increafe.*

There is not any thing of greater importance in philofophy, than a due attention to this divifion of propofitions. If we are careful never to affirm things abfolutely, but where the ideas are infeparably conjoined; and if in our other judgments, we diftinctly mark the conditions which determine the predicate to belong to the fubject, we fhall be the lefs liable to miftake in applying general truths to the particular concerns of human life. It is owing to the exact obfervance of this rule, that mathematicians have been fo happy in their difcoveries, and that what they demonftrate of magnitude in general, may be applied with eafe in all obvious occurrences.

The truth is, particular propofitions are then known to be true, when we can trace their connection with univerfals; and it is accordingly the great bufinefs of fcience, to find out general truths, that may be applied with fafety in all obvious inftances. Now the great advantage arifing from determining with care the conditions upon which one idea may be affirmed or denied of another, is this; that thereby particular propofitions really become univerfal, may be introduced with certainty into our reafonings, and ferve as ftandards to conduct and regulate our judgments. To illuftrate this by a familiar inftance. If we fay, *Some water acts very forcibly;* the propofition is particular: And as the conditions on which this forcible action depends, are not mentioned, it is as yet uncertain in what cafes it may be applied. Let us then fupply thefe conditions, and the propofition will run thus: *Water conveyed in fufficient quantity, along a fteep defcent, acts very forcibly.* Here we have an univerfal judgment, inafmuch as the predicate *forcible action*, may be afcribed to all water under the circumftances mentioned. Nor is it lefs evident, that the propofition in this new form is of eafy application; and in fact we find, that men do apply it, in inftances where the forcible action of water is required; as in corn-mills, and many other works of art.

Of fimple and compound propofitions.

Hitherto we have treated of propofitions, where only two ideas are compared together. Thefe are in the general called *fimple;* becaufe having but one fubject and one predicate, they are the effect of a fimple judgment, that admits of no fubdivifion. But if feveral ideas offer themfelves to our thoughts at once, whereby we are led to affirm the fame thing of different objects, or different things of the fame object; the propofitions expreffing thefe judgments are called *compound:* becaufe they may be refolved into as many others as there are fubjects or predicates in the whole complex determination of the mind. Thus: *God is infinitely wife, and infinitely powerful.* Here there are two predicates, *infinite wifdom, and infinite power*, both affirmed of the fame fubject; and accordingly, the propofition may be refolved into two others, affirming thefe predicates feverally, in like manner in the propofition, *neither kings nor people are exempt from death:* the predicate is denied of both fubjects, and may therefore be feparated from them, in diftinct propofitions. Nor is it lefs evident, that if a complex judgment confifts of feveral fubjects and predicates, it may be refolved into as many fimple propofitions as are the number of different ideas compared together. *Riches and honours are apt to elate the mind, and increafe the number of our defires.* In this judgment, there are two fubjects and two predicates, and it is at the fame time apparent, that it may be refolved into four diftinct propofitions. *Riches are apt to elate the mind. Riches are apt to increafe the number of our defires.* And fo of honours.

Logicians have divided thefe compound propofitions into a great many different claffes; but not with a due regard to their proper definition. Thus, *conditionals, caufals, relatives*, &c. are mentioned as fo many diftinct fpecies of this kind, though in fact they are no more than fimple propofitions. To give an inftance of a conditional: *If a ftone is expofed to the rays of the fun, it will contract fome degree of heat.* Here we have but one fubject and one predicate; for the complex expreffion, *a ftone expofed to the rays of the fun*, conftitutes the proper fubject of this propofition, and is no more than one determinate idea. The fame thing happens in caufals. Rehoboam *was unhappy becaufe he followed evil counfel.* There is here an appearance of two propofitions, arifing from the complexity of the expreffion; but when we come to confider the matter more nearly, it is evident, that we have but a fingle fubject and predicate. *The purfuit of evil counfel brought mifery upon* Rehoboam. It is not enough therefore, to render a propofition compound, that the fubject and predicate are complex notions, requiring fometimes a whole fentence to exprefs them: For in this cafe, the comparifon is ftill confined to two ideas, and conftitutes what we call a fimple judgment. But where there are feveral fubjects, or predicates, or both, as the affirmation or negation may be alike extended to them all, the propofition expreffing fuch a judgment, is truly a collection of as many fimple ones as there are different ideas compared. Confining ourfelves therefore to this more ftrict and juft notion of compound propofitions, they are all reducible to two kinds, *viz. copulatives* and *disjunctives*.

A *copulative* propofition is, where the fubjects and predicates are fo linked together, that they may be all feverally affirmed or denied one of another. Of this nature are the examples of compound propofitions given above. *Riches and honours are apt to elate the mind, and increafe the number of our defires. Neither kings nor people are exempt from death.* In the firft of thefe, the

two predicates may be affirmed feverally of each fubject, whence we have four diftinct propofitions. The other furnifhes an example of the negative kind, where the fame predicate being disjoined from both fubjects, may be alfo denied of them in feparate propofitions.

The other fpecies of compound propofitions are thofe called disjunctives; in which, comparing feveral predicates with the fame fubject, we affirm that one of them neceffarily belongs to it, but leave the particular predicate undetermined. If any one, for example, fays, *This world either exifts of itfelf, or is the work of fome all-wife and powerful caufe*; it is evident, that one of the two predicates muft belong to the world; but as the propofition determines not which, it is therefore of the kind we call *disjunctive*. Such too are the following. *The fun either moves round the earth, or is the centre about which the earth revolves. Friendfhip finds men equal, or makes them fo.* It is the nature of all propofitions of this clafs, fuppofing them to be exact in point of form, that upon determining the particular predicate, the reft are of courfe to be removed; or if all the predicates but one are removed, that one neceffarily takes place. Thus in the example given above; if we allow the world to be the work of fome wife and powerful caufe, we of courfe deny it to be felf-exiftent; or if we deny it to be felf-exiftent, we muft neceffarily admit that it was produced by fome wife and powerful caufe. Now this particular manner of linking the predicates together, fo that the eftablifhing of one difplaces all the reft, or the excluding all but one neceffarily eftablifhes that one, cannot otherwife be effected than by means of *disjunctive* particles. And hence it is, that propofitions of this clafs take their name from thefe particles, which make fo neceffary a part of them, and indeed conftitute their very nature confidered as a diftinct fpecies.

Of the divifion of propofitions into felf-evident and demonftrable.

When any propofition is offered to the view of the mind, if the terms in which it is expreffed are underftood; upon comparing the ideas together, the agreement or difagreement afferted is either immediately perceived, or found to lie beyond the prefent reach of the underftanding. In the firft cafe, the propofition is faid to be *felf-evident*, and admits not of any proof, becaufe a bare attention to the ideas themfelves produces full conviction and certainty; nor is it poffible to call in any thing more evident, by way of confirmation. But where the connection or repugnance comes not fo readily under the infpection of the mind, there we muft have recourfe to reafoning; and if by a clear feries of proofs we can make out the truth propofed, infomuch that felf-evidence fhall accompany every ftep of the procedure, we are then able to demonftrate what we affert, and the propofition itfelf is faid to be *demonftrable*. When we affirm, for inftance, *that it is impoffible for the fame thing to be and not to be*; whoever underftands the terms made ufe of, perceives at firft glance the truth of what is afferted; nor can he by any efforts bring himfelf to believe the contrary. The propofition therefore is *felf evident*, and fuch that it is impoffible by reafoning to make it plainer; becaufe there is no truth more obvious, or better known, from which as a confequence it may be deduced. But if we fay, *This world had a beginning*; the affertion is indeed equally true, but fhines not forth with the fame degree of evidence. We find a great difficulty in conceiving how the world could be made out of nothing; and are not brought to a free and full confent, until by reafoning we arrive at a clear view of the abfurdity involved in the contrary fuppofition. Hence this propofition is of the kind we call *demonftrable*, in as much as its truth is not immediately perceived by the mind, but yet may be made appear by means of others more known and obvious, whence it follows as an unavoidable confequence.

From what has been faid it appears, that reafoning is employed only about demonftrable propofitions, and that our intuitive and felf-evident perceptions are the ultimate foundation on which it refts.

Self-evident propofitions furnifh the firft principles of reafoning; and it is certain, that if in our refearches we employ only fuch principles as have this character of felf evidence, and apply them according to the rules to be afterwards explained, we fhall be in no danger of error in advancing from one difcovery to another. For this we may appeal to the writings of the mathematicians, which being conducted by the exprefs model here mentioned, are an inconteftable proof of the firmnefs and ftability of human knowledge, when built upon fo fure a foundation. For not only have the propofitions of this fcience ftood the teft of ages; but are found attended with that invincible evidence, as forces the affent of all who duly confider the proofs upon which they are eftablifhed.

Firft then it is to be obferved, that they have been very careful in afcertaining their ideas, and fixing the fignification of their terms. For this purpofe they begin with *definitions*, in which the meaning of their words is fo diftinctly explained, that they cannot fail to excite in the mind the very fame ideas as are annexed to them by the writer. And indeed the clearnefs and irrefiftable evidence of mathematical knowledge is owing to nothing fo much as this care in laying the foundation. Where the relation between any two ideas is accurately and juftly traced, it will not be difficult for another to comprehend that relation, if, in fetting himfelf to difcover it, he brings the very fame ideas into comparifon. But if, on the contrary, he affixes to his words ideas different from thofe that were in the mind of him who firft advanced the demonftration; it is evident, that, as the fame ideas are not compared, the fame relation cannot fubfift, infomuch that a propofition will be rejected as falfe, which, had the terms been rightly underftood, muft have appeared unexceptionably true. A fquare, for inftance, is a figure bounded by four equal right lines, joined together at right angles. Here the nature of the angles makes no lefs a part of the idea, than the equality of the fides; and many properties demonftrated of the fquare flow entirely from its being a rectangular figure. If therefore we fuppofe a man, who has formed a partial notion of a fquare, comprehending only the equality of its fides without regard to the angles, reading fome demonftration that implies alfo this latter confideration; it is plain he would reject it as not univerfally true, in as much as it could not be applied where the fides were joined together

gether at unequal angles. For this laſt figure, anſwering ſtill to his idea of a ſquare, would be yet found without the property aſſigned to it in the propoſition. But if he comes afterwards to correct his notion, and render his idea complete, he will then readily own the truth and juſtneſs of the demonſtration.

We ſee therefore, that nothing contributes ſo much to the improvement and certainty of human knowledge, as the having determinate ideas, and keeping them ſteddy and invariable in all our diſcourſes and reaſonings about them. And on this account it is, that mathematicians always begin by defining their terms, and diſtinctly unfolding the notions they are intended to expreſs. Hence ſuch as apply themſelves to theſe ſtudies, having exactly the ſame views of things, and bringing always the very ſame ideas into compariſon, readily diſcern the relations between them.

When they have taken this firſt ſtep, and made known the ideas whoſe relations they intend to inveſtigate; their next care is, to lay down ſome ſelf evident truths, which may ſerve as a foundation for their future reaſonings. And here indeed they proceed with remarkable circumſpection, admitting no principles but what flow immediately from their definitions, and neceſſarily force themſelves upon the mind. Thus a *circle* is a figure formed by a right line, moving round ſome fixed point in the ſame plane. The fixed point round which the line is ſuppoſed to move, and where one of its extremities terminates, is called the *centre* of the circle. The other extremity, which is conceived to be carried round, until it returns to the point whence it firſt ſet out, deſcribes a curve running into itſelf, and termed the *circumference*. All right lines drawn from the centre to the circumference, are called *radii*. From theſe definitions compared, geometricians derive this ſelf-evident truth, *That the radii of the ſame circle are all equal one to another*.

We now obſerve, that, in all propoſitions, we either affirm or deny ſome property of the idea that conſtitutes the ſubject of our judgment, or we maintain that ſomething may be done or effected. The firſt ſort are called *ſpeculative* propoſitions, as in the example mentioned above, *the radii of the ſame circle are all equal one to another*. The others are called *practical*, for a reaſon too obvious to be mentioned; thus, *that a right line may be drawn from one point to another*, is a practical propoſition, inaſmuch as it expreſſes that ſomething may be done.

From this twofold conſideration of propoſitions ariſes the twofold diviſion of mathematical principles into *axioms* and *poſtulates*. By an *axiom* they underſtand any ſelf-evident *ſpeculative* truth: as, *that the whole is greater than its parts; that things equal to one and the ſame things are equal to one another*. But a ſelf-evident *practical* propoſition is what they call a *poſtulate*. Such are thoſe of *Euclid*; *That a finite right line may be continued directly forwards: That a circle may be deſcribed about any centre with any diſtance*. And as, in an *axiom*, the agreement or diſagreement between the ſubject and predicate muſt come under the immediate inſpection of the mind; ſo, in a *poſtulate*, not only the poſſibility of the thing aſſerted muſt be evident at firſt view, but alſo the manner in which it may be effected. For where this manner is not of itſelf apparent, the propoſition comes under the notion of the demonſtrable kind, and is treated as ſuch by geometrical writers. Thus, *to draw a right line from one point to another*, is aſſumed by *Euclid* as a *poſtulate*, becauſe the manner of doing it is ſo obvious as to require no previous teaching. But then it is not equally evident, *how we are to conſtruct an equilateral triangle*. For this reaſon he advances it as a demonſtrable propoſition, lays down rules for the exact performance, and at the ſame time proves, that if theſe rules are followed, the figure will be juſtly deſcribed.

This leads us to take notice, that as *ſelf-evident truths* are diſtinguiſhed into different kinds, according as they are ſpeculative or practical; ſo is it alſo with *demonſtrable* propoſitions. A demonſtrable ſpeculative propoſition, is by mathematicians called a *theorem*. Such is the 47th propoſition of the firſt book of the *Elements*, *viz. that in every right-angled triangle, the ſquare deſcribed upon the ſide ſubtending the right-angle is equal to both the ſquares deſcribed upon the ſides containing the right-angle*. On the other hand, a demonſtrable practical propoſition, is called a *problem*; as where *Euclid* teaches us *to deſcribe a ſquare upon a given right-line*.

It may not be amiſs to add, that beſides the four kinds of propoſitions already mentioned, mathematicians have alſo a fifth, known by the name of *corollaries*. Theſe are uſually ſubjoined to *theorems*, or *problems*, and differ from them only in this; that they flow from what is there demonſtrated, in ſo obvious a manner, as to diſcover their dependence upon the propoſition whence they are deduced, almoſt as ſoon as propoſed. Thus *Euclid* having demonſtrated, *that in every right lined triangle all the three angles taken together are equal to two right angles*; adds by way of corollary, *that all the three angles of any one triangle taken together are equal to all the three angles of any other triangle taken together*: which is evident at firſt ſight; becauſe in all caſes they are equal to two right ones, and things equal to one and the ſame thing are equal to one another.

The ſcholia of mathematicians are indifferently annexed to definitions, propoſitions, or corollaries; and anſwer the ſame purpoſes as annotations upon a claſſic author. For in them occaſion is taken to explain whatever may appear intricate and obſcure in a train of reaſoning; to anſwer objections; to teach the application and uſes of propoſitions; to lay open the original and hiſtory of the ſeveral diſcoveries made in the ſcience; and in a word, to acquaint us with all ſuch particulars as deſerve to be known, whether conſidered as points of curioſity or profit.

PART II. *Of* REASONING.

IT often happens, in comparing ideas together, that their agreement or diſagreement cannot be diſcerned at firſt view, eſpecially if they are of ſuch a nature as not to admit of an exact application one to another. When, for inſtance,

inſtance, we compare two figures of a different make, in order to judge of their equality or inequality, it is plain, that by barely conſidering the figures themſelves we cannot arrive at an exact determination; becauſe, by reaſon of their diſagreeing forms, it is impoſſible ſo to put them together, as that their ſeveral parts ſhall mutually coincide. Here then it becomes neceſſary to look out for ſome third idea, that will admit of ſuch an application as the preſent caſe requires; wherein if we ſucceed, all difficulties vaniſh, and the relation we are in queſt of may be traced with eaſe. Thus right-lined figures are all reducible to ſquares, by means of which we can meaſure their areas, and determine exactly their agreement or diſagreement in point of magnitude.

But how can any third idea ſerve to diſcover a relation between two others, by being compared ſeverally with theſe others? for ſuch a compariſon enables us to ſee how far the ideas with which this third is compared are connected or disjoined between themſelves. In the example mentioned above, of two right-lined figures, if we compare each of them with ſome ſquare whoſe area is known, and find the one exactly equal to it, and the other leſs by a ſquare-inch, we imediately conclude, that the area of the firſt figure is a ſquare-inch greater than that of the ſecond. This manner of determining the relation between any two ideas, by the intervention of ſome third with which they may be compared, is that which we call *reaſoning*. The great art lies, in finding out ſuch intermediate ideas, as, when compared with the others in the queſtion, will furniſh evident and known truths, becauſe it is only by means of them that we arrive at the knowledge of what is hidden and remote.

Hence it appears, that every act of reaſoning neceſſarily includes three diſtinct judgments; two wherein the ideas whoſe relation we want to diſcover are ſeverally compared with the middle idea, and a third wherein they are themſelves connected or disjoined according to the reſult of that compariſon. Now, as, in the firſt part of logic, our judgments, when put into words, were called propoſitions; ſo here, in the ſecond part, the expreſſions of our reaſonings are termed *ſyllogiſms*. And hence it follows, that as every act of reaſoning implies three ſeveral judgments, ſo very ſyllogiſm muſt include three diſtinct propoſitions. When a reaſoning is thus put into words, and appears in form of a ſyllogiſm, the intermediate idea made uſe of to diſcover the agreement or diſagreement we ſearch for is called the *middle term*; and the two ideas themſelves, with which this third is compared, go by the name of the *extremes*.

But as theſe things are beſt illuſtrated by examples; let us, for inſtance, ſet ourſelves to inquire, *whether men are accountable for their actions*. As the relation between the ideas of *man* and *accountableneſs*, comes not within the immediate view of the mind, our firſt care muſt be, to find out ſome third idea, that will enable us the more eaſily to diſcover and trace it. A very ſmall meaſure of reflection is ſufficient to inform us, that no creature can be accountable for his actions, unleſs we ſuppoſe him capable of diſtinguiſhing the good from the bad. Nor is this alone ſufficient. For what would it avail him to know good from bad actions, if he had no freedom of choice, nor could avoid the one and purſue the other? hence it becomes neceſſary to take in both conſiderations in the preſent caſe. It is at the ſame time equally apparent, that where-ever there is this ability of diſtinguiſhing good from bad actions, and of purſuing the one and avoiding the other, there alſo a creature is accountable. We have then got a third idea, with which *accountableneſs* is inſeparably connected, *viz. reaſon and liberty*; which are here to be conſidered as making up one complex conception. Let us now take this middle idea, and compare it with the other term in the queſtion, *viz. man*; and we all know by experience, that it may be affirmed of him. Having thus, by means of the intermediate idea, formed two ſeveral judgments, *viz. that man is poſſeſſed of reaſon and liberty*; and *that reaſon and liberty imply accountableneſs*; a third obviouſly and neceſſarily follows, *viz. that man is accountable for his actions*. Here then we have a complete act of reaſoning, in which there are three diſtinct judgments; two that may be ſtyled previous, in as much as they lead to the other, and ariſe from comparing the middle idea with the two ideas in the queſtion: the third is a conſequence of theſe previous acts, and flows from combining the extreme ideas between themſelves. If now we put this reaſoning into words, it exhibits what logicians term a ſyllogiſm, and runs this:

Every creature poſſeſſed of reaſon and liberty is accountable for his actions.

Man is a creature poſſeſſed of reaſon and liberty.

Therefore man is accountable for his actions.

In this ſyllogiſm there are three ſeveral propoſitions, expreſſing the three judgments implied in the act of reaſoning, and ſo diſpoſed as to repreſent diſtinctly what paſſes within the mind in tracing the more diſtant relations of its ideas. The two firſt propoſitions anſwer the two previous judgments in reaſoning, and are called the *premiſſes*, becauſe they are placed before the other. The third is termed the *concluſion*, as being gained in conſequence of what was aſſerted in the premiſſes. The terms expreſſing the two ideas whoſe relation we inquire after, as here *man* and *accountableneſs*, are in general called the *extremes*; and the intermediate idea, by means of which the relation is traced, *viz. a creature poſſeſſed of reaſon and liberty*, takes the name of the *middle term*. Hence it follows, that by the *premiſſes* of a ſyllogiſm we are always to underſtand the two propoſitions where the middle term is ſeverally compared with the *extremes*; for theſe conſtitute the previous judgments, whence the truth we are in queſt of is by reaſoning deduced. The *concluſion* is that other propoſition, in which the *extremes* themſelves are joined or ſeparated, agreeably to what appears upon the above compariſon.

The concluſion is made up of the extreme terms of the ſyllogiſm; and the extreme, which ſerves as the predicate of the concluſion, goes by the name of the *major term*; the other extreme, which makes the ſubject in the ſame propoſition, is called the *minor term*. From this diſtinction of the extremes, ariſes alſo a diſtinction between the premiſſes, where theſe extremes are ſeverally compared with the middle term. That propoſition which compares the greater extreme, or the predicate of the concluſion, with the middle term, is called the *major*

propoſition;

proposition; the other, wherein the same middle term is compared with the subject of the conclusion, or lesser extreme, is called the *minor proposition*. All this is obvious from the syllogism already given, where the conclusion is, *Man is accountable for his actions*. For here the predicate, *accountable for his actions*, being connected with the middle term in the first of the two premisses, *every creature possessed of reason and liberty is accountable for his actions*, gives what we call the *major proposition*. In the second of the premisses, *Man is a creature possessed of reason and liberty*, we find the lesser extreme, or subject of the conclusion, *viz. man*, connected with the same middle term, whence it is known to be the *minor proposition*. When a syllogism is proposed in due form, the major proposition is always placed first, the minor next, and the conclusion last.

These things premised, we may in the general define reasoning *to be an act or operation of the mind, deducing some unknown proposition from other previous ones that are evident and known*. These previous propositions, in a simple act of reasoning, are only two in number; and it is always required that they be of themselves apparent to the understanding, insomuch that we assent to and perceive the truth of them as soon as proposed. In the syllogism given above, the premisses are supposed to be self-evident truths, otherwise the conclusion could not be inferred by a single act of reasoning. If, for instance, in the major, *every creature possessed of reason and liberty is accountable for his actions*, the connection between the subject and predicate could not be perceived by a bare attention to the ideas themselves; it is evident, that this proposition would no less require a proof than the conclusion deduced from it. In this case a new middle term must be sought for, to trace the connection here supposed; and this of course furnishes another syllogism, by which having established the proposition in question, we are then, and not before, at liberty to use it in any succeeding train of reasoning. And should it so happen, that in this second essay there was still some previous proposition whose truth did not appear at first sight, we must then have recourse to a third syllogism in order to lay open that truth to the mind; because, so long as the premisses remain uncertain, the conclusion built upon them must be so too. When by conducting our thoughts in this manner, we at last arrive at some syllogism, where the previous propositions are intuitive truths; the mind then rests in full security, as perceiving that the several conclusions it has passed through stand upon the immoveable foundation of self-evidence, and when traced to their source terminate in it.

We see therefore, that in order to infer a conclusion by a single act of reasoning, the premisses must be intuitive propositions. Where they are not, previous syllogisms are required; in which case reasoning becomes a complicated act, taking in a variety of successive steps. This frequently happens in tracing the more remote relations of our ideas, where many middle terms being called in, the conclusion cannot be made out, but in consequence of a series of syllogisms following one another in a train. But although in this concatenation of propositions, those that form the premisses of the last syllogism are often considerably removed from self-evidence; yet if we trace the reasoning backwards, we shall find them the conclusions of previous syllogisms, whose premisses approach nearer and nearer to intuition in proportion as we advance, and are found at last to terminate in it. And if, after having thus unravelled a demonstration, we take it the contrary way; and observe how the mind, setting out with intuitive perceptions, couples them together to form a conclusion; how, by introducing this conclusion into another syllogism, it still advances one step farther; and so proceeds, making every new discovery subservient to its future progress; we shall then perceive clearly, that reasoning, in the highest exercise of that faculty, is no more than an orderly combination of those simple acts which we have already so full explained.

Thus we see, that reasoning, beginning with first principles, rises gradually from one judgment to another, and connects them in such a manner, that every stage of the progression brings intuitive certainty along with it. And now at length we may clearly understand the definition given above of this distinguishing faculty of the human mind. Reason is the ability of deducing unknown truths from principles or propositions that are already known. This evidently appears by the foregoing account, where we see, that no proposition is admitted into a syllogism, to serve as one of the previous judgments on which the conclusion rests, unless it is itself a known and established truth, whose connection with self-evident principles has been already traced.

Of the several kinds of reasoning; and first of that by which we determine the genera and species of things.

All the aims of human reason may be reduced to these two: 1. To rank things under those universal ideas to which they truly belong; and, 2. To ascribe to them their several attributes and properties in consequence of that distribution.

One great aim of human reason is, to determine the genera and species of things. Now, as in universal propositions we affirm some property of a genus or species, it is plain, that we cannot apply this property to particular objects, till we have first determined whether they are comprehended under that general idea of which the property is affirmed. Thus there are certain properties belonging to all *even* numbers, which nevertheless cannot be applied to any particular number, until we have first discovered it to be of the species expressed by that general name. Hence reasoning begins with referring things to their several divisions and classes in the scale of our ideas; and as these divisions are all distinguished by peculiar names, we hereby learn to apply the terms expressing general conceptions to such particular objects as come under our immediate observation.

Now, in order to arrive at these conclusions by which the several objects of perception are brought under general names, two things are manifestly necessary. First, that we take a view of the idea itself denoted by that general name, and carefully attend to the distinguishing marks which serve to characterize it. Secondly, that we compare this idea with the object under consideration, observing diligently wherein they agree or differ. If the

the idea is found to correſpond with the particular object, we then without heſitation apply the general name; but if no ſuch correſpondence intervenes, the concluſion muſt neceſſarily take a contrary turn. Let us, for inſtance, take the number *eight*, and conſider by what ſteps we are led to pronounce it an *even* number. Firſt then we call to mind the idea ſignified by the expreſſion *an even number, viz.* that it is *a number diviſible into two equal parts.* We then compare this idea with the number *eight*, and, finding them manifeſtly to agree, ſee at once the neceſſity of admitting the concluſion. Theſe ſeveral judgments therefore, transferred into language, and reduced to the form of a ſyllogiſm, appear thus:

Every number that may be divided into two equal parts is an EVEN *number.*

The number EIGHT *may be divided into two equal parts.*

Therefore the number EIGHT *is an* EVEN *numder.*

Here it may be obſerved, that where the general idea to which particular objects are referred is very familiar to the mind, this reference, and the application of the general name, ſeem to be made without any apparatus of reaſoning. When we ſee a horſe in the fields, or a dog in the ſtreet, we readily apply the name of the ſpecies; habit, and a familiar acquaintance with the general idea, ſuggeſting it inſtantaneouſly to the mind. We are not however to imagine on this account, that the underſtanding departs from the uſual rules of juſt thinking. A frequent repetition of acts begets a habit; and habits are attended with a certain promptneſs of execution that prevents our obſerving the ſeveral ſteps and gradations by which any courſe of action is accompliſhed. But in other inſtances, where we judge not by pre-contracted habits, as when the general idea is very complex, or leſs familiar to the mind; we always proceed according to the form of reaſoning eſtabliſhed above. A goldſmith, for inſtance, who is in doubt as to any piece of metal, whether it be of the ſpecies called *gold*; firſt examines its properties, and then comparing them with the general idea ſignified by that name, if he finds a perfect correſpondence, no longer heſitates under what claſs of metals to rank it.

But the great importance of this branch of reaſoning, and the neceſſity of care and circumſpection in referring particular objects to general ideas, is ſtill farther evident from the practice of the mathematicians. Every one who has read *Euclid* knows, that he frequently requires us to draw lines through certain points, and according to ſuch and ſuch directions. The figures thence reſulting are often ſquares, parallelograms, or rectangles. Yet *Euclid* never ſuppoſes this from their bare appearance, but always demonſtrates it upon the ſtricteſt principles of geometry. Nor is the method he takes in any thing different from that deſcribed above. Thus, for inſtance, having defined a ſquare to be a figure bounded by four equal ſides, joined together at right angles; when ſuch a figure ariſes in any conſtruction previous to the demonſtration of a propoſition, he yet never calls it by that name, until he has ſhewn that its ſides are equal, and all its angles right ones. Now this is apparently the ſame form of reaſoning we have before exhibited, in proving *eight* to be an even number.

Having thus explained the rules by which we are to conduct ourſelves in ranking particular objects under general ideas, and ſhewn their conformity to the practice and manner of the mathematicians; it remains only to obſerve, that the true way of rendering this part of knowledge both eaſy and certain, is, by habituating ourſelves to clear and determinate ideas, and keeping them ſteadily annexed to their reſpective names. For as all our aim is, to apply general words aright; if theſe words ſtand for invariable ideas, that are perfectly known to the mind, and can be readily diſtinguiſhed upon occaſion, there will be little danger of miſtake or error in our reaſonings. Let us ſuppoſe, that by examining any object, and carrying our attention ſucceſſively from one part to another, we have acquainted ourſelves with the ſeveral particulars obſervable in it. If among theſe we find ſuch as conſtitute ſome general idea, framed and ſettled beforehand by the underſtanding, and diſtinguiſhed by a particular name; the reſemblance, thus known and perceived, neceſſarily determines the ſpecies of the object, and thereby gives it a right to the name by which that ſpecies is called. Thus four equal ſides, joined together at right angles, made up the notion of a ſquare. As this is a fixed and invariable idea, without which the general name cannot be applied, we never call any particular figure a *ſquare*, until it appears to have theſe ſeveral conditions; and contrarily, where-ever a figure is found with theſe conditions, it neceſſarily takes the name of a *ſquare*. The ſame will be found to hold in all our other reaſonings of this kind; where nothing can create any difficulty but the want of ſettled ideas. If, for inſtance, we have not determined within ourſelves the preciſe notion denoted by the word *manſlaughter*; it will be impoſſible for us to decide, whether any particular action ought to bear that name: becauſe however nicely we examine the action itſelf, yet being ſtrangers to the general idea with which it is to be compared, we are utterly unable to judge of their agreement or diſagreement. But if we take care to remove this obſtacle, and diſtinctly trace the two ideas under conſideration, all difficulties vaniſh, and the reſolution becomes both eaſy and certain.

Thus we ſee, of what importance it is, towards the improvement and certainty of human knowledge, that we accuſtom ourſelves to clear and determinate ideas, and a ſteady application of words.

Of Reaſoning, as it regards the powers and properties of things, and the relations of our general ideas.

WE come now to the ſecond great end which men have in view in their reaſonings, namely, The diſcovering and aſcribing to things their ſeveral attributes and properties. And here it will be neceſſary to diſtinguiſh between reaſoning as it regards the ſciences, and as it concerns common life. In the ſciences, our reaſon is employed chiefly about univerſal truths, it being by them alone that the bounds of human knowledge are enlarged. Hence the diviſion of things into various claſſes, called otherwiſe genera and ſpecies. For theſe univerſal ideas, being ſet up as the repreſentatives of many particular things, whatever is affirmed of them may be alſo affirmed of all the individuals to which they belong. *Murder*, for inſtance, is

is a general idea, reprefenting a certain fpecies of human actions. Reafon tells us that the punifhment due to it is *death*. Hence every particular action coming under the notion of *murder*, has the punifhment of *death* allotted to it. Here then we apply the general truth to fome obvious inftance, and this is what properly conftitutes the reafoning of common life. For men, in their ordinary tranfactions and intercourfe one with another, have for the moft part to do only with particular objects. Our friends and relations, their characters and behaviour, the conftitution of the feveral bodies that furround us, and the ufes to which they may be applied, are what chiefly engage our attention. In all thefe we reafon about particular things; and the whole refult of our reafoning is, the applying the general truths of the fciences to the ordinary tranfactions of human life. When we fee a viper, we avoid it. Where-ever we have occafion for the forcible action of water, to move a body that makes confiderable refiftance, we take care to convey it in fuch a manner that it fhall fall upon the object with impetuofity. Now all this happens in confequence of our familiar and ready application of thefe two general trruths. *The bite of a viper is mortal. Water falling upon a body with impetuofity, acts very forcibly towards fetting it in motion.* In like manner, if we fet ourfelves to confider any particular character, in order to determine the fhare of praife or difpraife that belongs to it, our great concern is, to afcertain exactly the proportion of virtue and vice. The reafon is obvious. A juft determination in all cafes of this kind depends entirely upon an application of thefe general maxims of morality: *Virtuous actions deferve praife. Vicious actions deferve blame.*

Henceit appears, that reafoning, as it regards common life, is no more than the afcribing the general properties of things to thofe feveral objects with which we are more immediately concerned, according as they are found to be that particular divifion or clafs to which the properties belong. The fteps then by which we proceed are manifeftly thefe. Firft, we refer the object under confideration to fome general idea or clafs of things. We then recollect the feveral attributes of that general idea. And laftly, afcribe all thofe attributes to the prefent object. Thus, in confidering the character of *Sempronius*, if we find it to be of the kind called *virtuous*; when we at the fame time reflect, that a *virtuous* character is deferving of efteem, it naturally and obvioufly follows that *Sempronius* is fo too. Thefe thoughts put into a *fyllogifm*, in order to exhibit the form of reafoning here required, run thus.

Every virtuous man is worthy of efteem.

SEMPRONIUS *is a virtuous man.*

Therefore SEMPRONIUS *is worthy of efteem.*

By this *fyllogifm* it appears, that before we affirm any thing of a particular object, that object muft be referred to fome general idea. *Sempronius* is pronounced worthy of efteem, only in confequence of his being a virtuous man. Hence we fee the neceffary connection of the various parts of reafoning, and the dependence they have one upon another. The determining the genera and fpecies of things is, as we have faid, one exercife of human reafon; and here we find, that this exercife is the firft in order, and previous to the other, which confifts in afcribing to them their powers, properties, and relations. But when we have taken this previous ftep, and brought particular objects under general names; as the properties we afcribe to them are no other than thofe of the general idea, it is plain, that in order to a fuccefsful progrefs in this part of knowledge, we muft thoroughly acquaint ourfelves with the feveral relations and attributes of thefe our general ideas. When this is done, the other part will be eafy, and require fcarce any labour of thought, as being no more than an application of the general form of reafoning reprefented in the foregoing *fyllogifm*. Now as we have already fufficiently fhewn how we are to proceed in determining the genera and fpecies of things, all that is farther wanting towards a due explanation of it is, to offer fome confiderations as to the manner of inveftigating the general relations of our ideas. This is the higheft exercife of the powers of the underftanding, and that by means whereof we arrive at the difcovery of univerfal truths, infomuch that our deductions in this way conftitute that particular fpecies of reafoning which we have before faid regards principally the fciences.

But that we may conduct our thoughts with fome order and method, we fhall begin with obferving, that the relations of our general ideas are of two kinds. Either fuch as immediately difcover themfelves, upon comparing the ideas one with another; or fuch as, being more remote and diftant, require art and contrivance to bring them into view. The relations of the firft kind furnifh us with intuitive and felf-evident truths; thofe of the fecond are traced by reafoning and a due application of intermediate ideas. It is of this laft kind that we are to fpeak here, having difpatched what was neceffary with regard to the other in the former part. As therefore, in tracing the more diftant relations of things, we muft always have recourfe to intervening ideas, and are more or lefs fuccefsful in our refearches, according to our acquaintance with thefe ideas, and ability of applying them; it is evident, that to make a good reafoner, two things are principally required. *Firft*, an extenfive knowledge of thofe intermediate ideas, by means of which things may be compared one with another. *Secondly*, the fkill and talent of applying them happily, in all particular inftances that come under confideration.

In order to our fuccefsful progrefs in reafoning, we muft have an extenfive knowledge of thofe intermediate ideas by means of which things may be compared one with another. For as it is not every idea that will anfwer the purpofe of our inquiries, but fuch only as are peculiarly related to the objects about which we reafon, fo as, by a comparifon with them, to furnifh evident and known truths; nothing is more apparent, than that the greater variety of conceptions we can call into view, the more likely we are to find fome among them that will help us to the truths here required. And indeed it is found to hold in experience, that in proportion as we enlarge our views of things, and grow acquainted with a multitude of different objects, the reafoning faculty gathers ftrength. For by extending our fphere of knowledge, the mind acquires a certain force and penetration, as being accuftomed to examine the feveral appearances of its ideas, and obferve what light they caft one upon another.

This

This is the reason, why, in order to excel remarkably in any one branch of learning, it is necessary to have at least a general acquaintance with the whole circle of arts and sciences. The truth is, all the various divisions of human knowledge are very nearly related among themselves, and in innumerable instances serve to illustrate and set off each other. And altho' it is not to be denied, that, by an obstinate application to one branch of study, a man may make considerable progress and acquire some degree of eminence in it; yet his views will be always narrow and contracted, and he will want that masterly discernment, which not only enables us to pursue our discoveries with ease, but also, in laying them open to others, to spread a certain brightness around them. But when our reasoning regards a particular science, it is farther necessary, that we more nearly acquaint ourselves with whatever relates to that science. A general knowledge is a good preparation, and enables us to proceed with ease and expedition, in whatever branch of learning we apply to. But then in the minute and intricate questions of any science we are by no means qualified to reason with advantage, until we have perfectly mastered the science to which they belong.

We come now to the second thing required, in order to a successful progress in reasoning, namely, the skill and talent of applying intermediate ideas happily in all particular instances that come under consideration. Use and exercise are the best instructors in the present case. And therefore the true way to acquire this talent is, by being much conversant in those sciences where the art of reasoning is allowed to reign in the greatest perfection. Hence it was that the ancients, who so well understood the manner of forming the mind, always began with *mathematicks*, as the foundation of their philosophical studies. Here the understanding is by degrees habituated to truth, contracts insensibly a certain fondness for it, and learns never to yield its assent to any proposition, but where the evidence is sufficient to produce full conviction. For this reason *Plato* has called mathematical demonstrations the *catharticks* or purgatives of the soul, as being the proper means to cleanse it from error, and restore that natural exercise of its faculties, in which just thinking consists.

If therefore we would form our minds to a habit of reasoning closely and in train, we cannot take any more certain method, than the exercising ourselves in mathematical demonstrations, so as to contract a kind of familiarity with them. Not that we look upon it as necessary that all men should be deep mathematicians, but that, having got the way of reasoning which that study necessarily brings the mind to, they may be able to transfer it to other parts of knowledge, as they shall have occasion.

But although the study of mathematicks be of all others the most useful to form the mind, and give it an early relish of truth, yet ought not other parts of philosophy to be neglected. For there also we meet with many opportunities of exercising the powers of the understanding: and the variety of subjects naturally leads us to observe all those different turns of thinking that are peculiarly adapted to the several ideas we examine and the truths we search after. For this purpose, besides the study of mathematicks, we ought to apply ourselves diligently to the reading of such authors as have distinguished themselves for strength of reasoning, and a just and accurate manner of thinking. For it is observable, that a mind exercised and seasoned to truth, seldom rests satisfied in a bare contemplation of the arguments offered by others, but will be frequently essaying its own strength, and pursuing its discoveries upon the plan it is most accustomed to. Thus we insensibly contract a habit of tracing truth from one stage to another, and of investigating those general relations and properties, which we afterwards ascribe to particular things, according as we find them comprehended under the abstract ideas to which the properties belong.

Of the forms of Syllogisms.

Hitherto we have contented ourselves with a general notion of syllogisms, and of the parts of which they consist. It is now time to enter a little more particularly into the subject, to examine their various forms, and lay open the rules of argumentation proper to each. In the syllogisms mentioned in, we may observe, that the *middle term* is the subject of the *major* proposition, and the predicate of the *minor*. This disposition, though the most natural and obvious, is not however necessary; it frequently happenning, that the *middle term* is the subject in both the premisses, or the predicate in both; and sometimes directly contrary, the predicate in the *major*, and the subject in the *minor*. Hence the distinction of syllogisms into various kinds, called *figures* by logicians. For *figure*, according to their use of the word, is nothing else but the order and disposition of the *middle term* in any syllogism. And as this disposition is fourfold, so the figures of syllogisms thence arising are four in number. When the *middle term* is the subject of the *major* proposition, and the predicate of the *minor*, we have what is called the *first figure*. If, on the other hand, it is the predicate of both the premisses, the syllogism is said to be in the *second figure*. Again, in the *third figure*, the *middle term* is the subject of the two premisses. And lastly, by making it the predicate of the *major*, and subject of the *minor*, we obtain syllogisms in the *fourth figure*.

But besides this fourfold distinction of syllogisms, there is also a farther subdivision of them in every figure, arising from the *quantity* and *quality*, as they are called, of the propositions. By *quantity* we mean the consideration of propositions as universal or particular; by *quality*, as affirmative or negative. Now as, in all the several dispositions of the *middle term*, the proposition of which a syllogism consists may be either universal or particular, affirmative or negative; the due determination of these, and so putting them together as the laws of argumentation require, constitute what logicians call the *moods* of syllogisms. Of these *moods* there are a determinate number to every figure, including all the possible ways in which propositions differing in *quantity* or *quality* can be combined, according to any disposition of the *middle term*, in order to arrive at a just conclusion.

The division of syllogisms according to mood and figure,

gure, refpects thofe efpecially which are known by the name of plain fimple fyllogifms; that is, which are bounded to three propofitions, all fimple, and where the extremes and middle term are connected according to the rules laid down above. But as the mind is not tied down to any one precife form of reafoning, but fometimes makes ufe of more, fometimes of fewer premiffes, and often takes in compound and conditional propofitions, it may not be amifs to take notice of the different forms derived from this fource. and explain the rule by which the mind conducts itfelf in the ufe of them.

When, in any fyllogifm, the *major* is a conditional propofition, the fyllogifm itfelf is termed *conditional*. Thus:

If there is a God, he ought to be worfhipped.
But there is a God:
Therefore he ought to be worfhipped.

In this example, the *major* is conditional, and therefore the fyllogifm itfelf is alfo of the kind called by that name. All conditional propofitions are made up of two diftinct parts: one expreffing the condition upon which the predicate agrees or difagrees with the fubject, as in this now before us, *if there is a God;* the other joining or disjoining the faid predicate and fubject, as here, *he ought to be worfhipped.* The firft of thefe parts, or that which implies the condition, is called the *antecedent*; the fecond, where we join or disjoin the predicate and fubject, has the name of the *confequent*.

In all propofitions of this kind, fuppofing them to be exact in point of form, the relation between the antecedent and confequent muft ever be true and real; that is, the antecedent muft always contain fome certain and genuine condition, which neceffarily implies the confequent; for otherwife the propofition itfelf will be falfe, and therefore ought not to be admitted into our reafonings. Hence it follows, that when any conditional propofition is affumed, if we admit the antecedent of that propofition, we muft at the fame time neceffarily admit the confequent; but if we reject the confequent, we are in like manner bound to reject alfo the antecedent. For as the antecedent always expreffes fome condition, which neceffarily implies the truth of the confequent; by admitting the antecedent we allow of that condition, and therefore ought alfo to admit the confequent. In like manner if it appears that the confequent ought to be rejected, the antecedent evidently muft be fo too; becaufe the admitting of the antecedent would neceffarily imply the admiffion alfo of the confequent.

There are two ways of arguing in *hypothetical* fyllogifms, which lead to a certain and unavoidable conclufion. For as the *major* is always a conditional propofition, confifting of an antecedent and a confequent; if the *minor* admits the antecedent, it is plain that the conclufion muft admit the confequent. This is called arguing from the admiffion of the antecedent to the admiffion of the confequent, and conftitutes that mood or fpecies of *hypothetical* fyllogifms which is diftinguifhed in the fchools by the name of the *modus ponens*, in as much as by it the whole conditional propofition both antecedent and confequent is eftablifhed. Thus:

If God is infinitely wife, and acts with perfect freedom, he does nothing but what is beft.
But God is infinitely wife, and acts with perfect freedom:
Therefore he does nothing but what is beft.

Here the antecedent or firft part of the conditional propofition is eftablifhed in the *minor*, and the confequent or fecond part in the conclufion; whence the fyllogifm itfelf is an example of the *modus ponens*. But if we, on the contrary, fuppofe, that the *minor* rejects the confequent; then it is apparent, that the conclufion muft alfo reject the antecedent. In this cafe we are faid to argue from the removal of the confequent to the removal of the antedent, and the particular mood or fpecies of fyllogifms thence arifing is called by logicians the *modus tollens*; becaufe in it both antecedent and confequent are rejected or taken away, as appears by the following example.

If God were not a being of infinite goodnefs, neither would he confult the happinefs of his creatures.
But God does confult the happinefs of his creatures;
Therefore he is a being of infinite goodnefs.

Thefe two fpecies take in the whole clafs of *conditional* fyllogifms, and include all the poffible ways of arguing that lead to a legitimate conclufion; becaufe we cannot here proceed by a contrary procefs of reafoning, that is, from the removal of the antecedent to the removal of the confequent, or from the eftablifhing of the confequent to the eftablifhing of the antecedent. For although the antecedent always expreffes fome real condition, which once admitted neceffarily implies the confequent, yet it does not follow that there is therefore no other condition; and if fo, then, after removing the antecedent, the confequent may ftill hold, becaufe of fome other determination that infers it. When we fay: *If a ftone is expofed fome time to the rays of the fun, it will contract a certain degree of heat*; the propofition is certainly true; and admitting the antecedent, we muft alfo admit the confequent. But as there are other ways by which a ftone may gather heat, it will not follow, from the ceafing of the before-mentioned condition, that therefore the confequent cannot take place. In other words, we cannot argue: *But the ftone has not been expofed to the rays of the fun; therefore neither has it any degree of heat:* in as much as there a great many other ways by which heat might have been communicated to it. And if we cannot argue from the removal of the antecedent to the removal of the confequent, no more can we from the admiffion of the confequent to the admiffion of the antecedent; becaufe as the confequent may flow from a great variety of different fuppofitions, the allowing of it does not determine the precife fuppofition, but only that fome one of them muft take place. Thus, in the foregoing propofition, *If a ftone is expofed fome time to the rays of the fun, it will contract a certain degree of heat;* admitting the confequent, *viz. that it has contracted a certain degree of heat*, we are not therefore bound to admit the antecedent, *that it has been fome time expofed to the rays of the fun*, becaufe there are many other caufes whence that heat may have proceeded. Thefe two ways of arguing, therefore, hold not in conditional fyllogifms.

As from the *major's* being a conditional propofition, we obtain the fpecies of conditional fyllogifms; fo where it is

is a disjunctive proposition, the syllogism to which it belongs is also called *disjunctive*, as in the following example:

The world is either self-existent, or the work of some finite, or of some infinite being.

But it is not self-existent, nor the work of a finite being.

Therefore it is the work of an infinite being.

Now a disjunctive proposition is that where, of several predicates, we affirm one necessarily to belong to the subject, to the exclusion of all the rest, but leave that particular one undetermined. Hence it follows, that as soon as we determine the particular predicate, all the rest are of course to be rejected; or, if we reject all the predicates but one, that one necessarily takes place. When therefore, in a *disjunctive* syllogism, the several predicates are enumerated in the *major*; if the *minor* establishes any one of these predicates, the conclusion ought to remove all the rest; or if, in the *minor*, all the predicates but one are removed, the conclusion must necessarily establish that one. Thus, in the *disjunctive* syllogism given above, the *major* affirms one of three predicates to belong to the earth, *viz. self-existence*, or that it is *the work of a finite* or that it is *the work of an infinite being*. Two of these predicates are removed in the *minor*, viz. *self-existence*, and *the work of a finite being*. Hence the conclusion necessarily ascribes to it the third predicate, and affirms that it is *the work of an infinite being*. If now we give the syllogism another turn, insomuch that the minor may establish one of the predicates, by affirming the earth to be *the production of an infinite being*; then the conclusion must remove the other two, asserting it to be neither *self-existent*, nor *the work of a finite being*. These are the forms of reasoning in this species of syllogisms, the justness of which appears at first sight; and that there can be no other, is evident from the very nature of a disjunctive proposition.

In the several kinds of syllogisms hitherto mentioned, the parts are complete, that is, the three propositions of which they consist are represented in form. But it often happens, that some one of the premisses is not only an evident truth, but also familiar and in the minds of all men; in which case it is usually omitted, whereby we have an imperfect syllogism, that seems to be made up of only two propositions. Should we, for instance, argue in this manner;

Every man is mortal;

Therefore every king is mortal:

the syllogism appears to be imperfect, as consisting but of two propositions. Yet it is really complete, only the *minor* [*Every king is a man*] is omitted, and left to the reader to supply, as being a proposition so familiar and evident, that it cannot escape him.

These seemingly imperfect syllogisms are called *enthymemes*, and occur very frequently in reasoning, especially where it makes a part of common conversation. Nay, there is a particular elegance in them; because, not displaying the argument in all its parts, they leave somewhat to the exercise and invention of the mind. By this means we are put upon exerting ourselves, and seem to share in the discovery of what is proposed to us. Now this is the great secret of fine writing, so to frame and put together our thoughts, as to give full play to the reader's imagination, and draw him insensibly into our very views and course of reasoning. This gives a pleasure not unlike to that which the author himself feels in composing. It besides shortens dicourse, and adds a certain force and liveliness to our arguments, when the words in which they are conveyed favour the natural quickness of the mind in its operations, and a single expression is left to exhibit a whole train of thoughts.

But there is another species of reasoning with two propositions, which seems to be complete in itself, and where we admit the conclusion without supposing any tacit or suppressed judgment in the mind from which it follows syllogistically. This happens between propositions where the connection is such that the admission of the one necessarily and at the first sight implies the admission also of the other. For if it so falls out, that the proposition on which the other depends is self-evident, we content ourselves with barely affirming it, and infer that other by a direct conclusion. Thus, by admitting an universal proposition, we are forced also to admit of all the particular propositions comprehended under it, this being the very condition that constitutes a proposition universal. If then that universal proposition chances to be self-evident, the particular ones follow of course, without any farther train of reasoning. Whoever allows, for instance, *that things equal to one and the same things are equal to one another*, must at the same time allow, *that two triangles, each equal to a square whose side is three inches, are also equal between themselves*. This argument therefore,

Things equal to one and the same thing are equal to one another;

Therefore these two triangles, each equal to the square of a line of three inches, are equal between themselves,

is complete in its kind, and contains all that is necessary towards a just and legitimate conclusion. For the first or universal proposition is self-evident, and therefore requires no farther proof. And as the truth of the particular is inseparably connected with that of the universal, it follows from it by an obvious and unavoidable consequence.

Now in all cases of this kind, where propositions are deduced one from another, on account of a known and evident connection, we are said to reason by *immediate consequence*. Such a coherence of propositions, manifest at first sight, and forcing itself upon the mind, frequently occurs in reasoning. Logicians have explained at some length the several suppositions upon which it takes place, and allow of all *immediate consequences* that follow in conformity to them. It is however observable, that these arguments, though seemingly complete, because the conclusion follows necessarily from the single proposition that goes before, may yet be considered as real *enthymemes*, whose *major*, which is a conditional proposition, is wanting. The syllogism but just mentioned, when represented according to this view, will run as follows:

If things equal to one and the same thing are equal to one another; these two triangles, each equal to a square whose side is three inches, are also equal between themselves.

But things equal to one and the ſame thing, are equal to one another;

Therefore alſo theſe triangles, &c. *are equal between themſelves*.

This obſervation will be found to hold in all *immediate conſequences* whatſoever, inſomuch that they are in fact no more than *enthymemes* of hypothetical ſyllogiſms. But then it is particular to them, that the ground on which the concluſion reſts, namely, its coherence with the *minor*, is of itſelf apparent, and ſeen immediately to flow from the rules and reaſons of logic.

The next ſpecies of reaſoning we ſhall take notice of is what is known by the name of a *ſorites*. This is a way of arguing, in which a great number of propoſitions are ſo linked together, that the predicate of one becomes continually the ſubject of the next following, until at laſt a concluſion is formed, by bringing together the ſubject of the firſt propoſition, and the predicate of the laſt. Of this kind is the following argument.

God is omnipotent.

An omnipotent being can do every thing poſſible.

He that can do every thing poſſible, can do whatever involves not a contradiction.

Therefore God can do whatever involves not a contradiction.

This particular combination of propoſitions, may be continued to any length we pleaſe, without in the leaſt weakening the ground upon which the concluſion reſts. The reaſon is, becauſe the *ſorites* itſelf may be reſolved into as many ſimple ſyllogiſms as there are middle terms in it; where this is found univerſally to hold, that when ſuch a reſolution is made, and the ſyllogiſms are placed in train, the concluſion of the laſt in the ſeries is alſo the concluſion of the *ſorites*. This kind of argument therefore, as it ſerves to unite ſeveral ſyllogiſms into one, muſt ſtand upon the ſame foundation with the ſyllogiſms of which it conſiſts, and is indeed, properly ſpeaking, no other than a compendious way of reaſoning ſyllogiſtically.

What is here ſaid of plain ſimple propoſitions, may be as well applied to thoſe that are conditional; that is, any number of them may be ſo joined together in a ſeries, that the conſequent of one ſhall become continually the antecedent of the next following; in which caſe, by eſtabliſhing the antecedent of the firſt propoſition, we eſtabliſh the conſequent of the laſt, or, by removing the laſt conſequent, remove alſo the firſt antecedent. This way of reaſoning is exemplified in the following argument.

If we love any perſon, all emotions of hatred towards him ceaſe.

If all emotions of hatred towards a perſon ceaſe, we cannot rejoice in his misfortunes.

If we rejoice not in his misfortunes, we certainly wiſh him no injury.

Therefore if we love a perſon, we wiſh him no injury.

It is evident that this *ſorites*, as well as the laſt, may be reſolved into a ſeries of diſtinct ſyllogiſms; with this only difference, that here the ſyllogiſms are all conditional.

We come now to that kind of argument which logicians called *induction*; in order to the right underſtanding of which, it will be neceſſary to obſerve, that our general ideas are for the moſt part capable of various ſubdiviſions. Thus the idea of the loweſt ſpecies may be ſubdivided into its ſeveral individuals, the idea of any genus into the different ſpecies it comprehends, and ſo of the reſt. If then we ſuppoſe this diſtribution to be duly made, and ſo as to take in the whole extent of the idea to which it belongs; then it is plain, that all the ſubdiviſions or parts of any idea together conſtitute that whole idea. Thus the ſeveral individuals of any ſpecies taken together conſtitute the whole ſpeeies, and all the various ſpecies comprehended under any genus make up the whole genus. This being allowed, whatever may be affirmed of all the ſeveral ſubdiviſions and claſſes of any idea, ought to be affirmed of the whole general idea to which theſe ſubdiviſions belong. What may be affirmed of all the individuals of any ſpecies, may be affirmed of the whole ſpecies, and what may be affirmed of all the ſpecies of any genus may be alſo affirmed of the whole genus; becauſe all the individuals taken together are the ſame with the ſpecies, and all the ſpecies taken together the ſame with the genus.

This way of arguing, where we infer univerſally concerning any idea what we had before affirmed or denied ſeparately of all its ſeveral ſubdiviſions and parts, is called reaſoning by *induction*. Thus if we ſuppoſe the whole tribe of animals, ſubdivided into men, beaſts, birds, inſects, and fiſhes, and then reaſon concerning them after this manner: *All men have a power of beginning motion; all beaſts, birds, and inſects, have a power of beginning motion; all fiſhes have a power of beginning motion; therefore all animals have a power of beginning motion*: the argument is an *induction*. When the ſubdiviſions are juſt, ſo as to take in the whole general idea, and the enumeration is perfect, that is, extends to all and every of the inferior claſſes or parts; there the *induction* is compleat, and the manner of reaſoning by *induction* is apparently concluſive.

The laſt ſpecies of ſyllogiſms we ſhall take notice of, is that commonly diſtinguiſhed by the name of a *dilemma*. A *dilemma* is an argumeet, by which we endeavour to prove the abſurdity or falſehood of ſome aſſertion. In order to this we aſſume a conditional propoſition, the antecedent of which is the aſſertion to be diſproved, and the conſequent a disjunctive propoſition, enumerating all the poſſible ſuppoſitions upon which that aſſertion can take place. If then it appears, that all the ſeveral ſuppoſitions ought to be rejected, it is plain that the antecedent or aſſertion itſelf muſt be ſo too. When therefore ſuch a propoſition as that before-mentioned is made the *major* of any ſyllogiſm; if the *minor* rejects all the ſuppoſitions contained in the conſequent, it follows neceſſarily, that the concluſion ought to reject the antecedent, which, as we have ſaid, is the very aſſertion to be diſproved. This particular way of arguing is that which logicians call a *dilemma*; and from the account here given of it, it appears, that we may in the general define it to be *a hypothetical ſyllogiſm, where the conſequent of the major is a disjunctive propoſition, which is wholly taken away or removed in the minor*. Of this kind is the following;

If God did not create the world perfect in its kind it muſt

must either proceed from want of inclination, or from want of power.

But it could not proceed either from want of inclination, or from want of power:

Therefore he created the world perfect in its kind; or, which is the same thing, *It is absurd to say that he did not create the world perfect in its kind.*

The nature then of a *dilemma* is universally this. The *major* is a conditional proposition, whose consequent contains all the several suppositions upon which the antecedent can take place. As therefore these suppositions are wholly removed in the *minor*, it is evident that the antecedent must be so too; insomuch that we here always argue from the removal of the consequent to the removal of the antecedent. That is, a *dilemma* is an argument in the *modus tollens* of hypothetical syllogisms, as logicians speak. Hence it is plain, that if the antecedent of the *major* is an affirmative proposition, the conclusion of the *dilemma* will be negative; but if it is a negative proposition, the conclusion will be affirmative.

Of Demonstration.

Having dispatched what seemed necessary with regard to the forms of syllogisms, we shall now explain their use and application in reasoning. We have seen, that in all the different appearances they put on, we still arrive at a just and legitimate conclusion: now it often happens, that the conclusion of one syllogism becomes a previous proposition in another, by which means great numbers of them are sometimes linked together in a series, and truths are made to follow one another in train. And as in such a concatenation of syllogisms, all the various ways of reasoning that are truly conclusive may be with safety introduced; hence it is plain, that in deducing any truth from its first principles, especially where it lies at a considerable distance from them, we are at liberty to combine all the several kinds of arguments above explained, according as they are found best to suit the end and purpose of our inquiries. When a proposition is thus, by means of syllogisms, collected from others more evident and known, it is said to be *proved;* so that we may in the general define *the proof of the proposition* to be a syllogism, or series of syllogisms, collecting that proposition from known and evident truths. But more particularly, if the syllogisms of which the proof consists admit of no premisses but definitions, self-evident truths, and propositions already established, then is the argument so constituted called a *demonstration*; whereby it appears, that demonstrations are ultimately founded on definitions and self-evident propositions.

All syllogisms whatsoever, whether compound, multiform, or defective, are reducible to plain simple syllogisms in some one of the four figures. But this is not all. Syllogisms of the first figure in particular, admit of all possible conclusions: that is, any proposition whatsoever, whether an universal affirmative, or universal negative, a particular affirmative, or particular negative, which fourfold division embraces all their varieties: any one of these may be inferred, by virtue of some syllogism in the first figure. By this means the syllogisms of all the other figures are reducible also to syllogisms of the first figure, and may be considered as standing on the same foundation with them. We cannot here demonstrate and explain the manner of this reduction. It is enough to take notice, that the thing is universally known and allowed among logicians, to whose writings we refer such as desire farther satisfaction in this matter. This then being laid down, it is plain, that any demonstration whatsoever may be considered as composed of a series of syllogisms, all in the first figure. For since all the syllogisms that enter the demonstration are reducible to syllogisms of some one of the four figures, and since the syllogisms of all the other figures are farther reducible to syllogisms of the first figure, it is evident, that the whole demonstration may be resolved into a series of these last syllogisms. Let us now, if possible, discover the ground upon which the conclusion rests, in syllogisms of the first figure; because, by so doing, we shall come at an universal principle of certainty, whence the evidence of all demonstrations in all their parts may be ultimately derived.

The rules then of the first figure are these. The *middle term* is the subject of the *major* proposition, and the predicate of the *minor*. The *major* is always an universal proposition, and the *minor* always affirmative. Let us now see what effect these rules will have in reasoning. The *major* is an universal proposition, of which the *middle term* is the subject, and the *predicate of the conclusion* the predicate. Hence it appears, that in the *major*, the *predicate of the conclusion* is always affirmed or denied universally of the *middle term*. Again, the *minor* is an affirmative proposition, whereof the *subject of the conclusion* is the subject, and the *middle term* the predicate. Here then the *middle term* is affirmed of the *subject of the conclusion;* that is, the *subject of the conclusion* is affirmed to be comprehended under, or to make a part of the *middle term*. Thus then we see what is done in the *premisses* of a syllogism of the first figure. The *predicate of the conclusion* is universally affirmed or denied of some idea. The *subject of the conclusion* is affirmed to be or to make a part of that idea. Hence it naturally and unavoidably follows, that the *predicate of the conclusion* ought to be affirmed or denied of the subject. To illustrate this by an example, we shall resume one of the former syllogisms.

Every creature possessed of reason and liberty is accountable for his actions.

Man is a creature possessed of reason and liberty.

Therefore man is accountable for his actions.

Here, in the first proposition, the predicate of the conclusion, *accountableness*, is affirmed of all creatures that have *reason and liberty*. Again, in the second proposition, *man*, the subject of the conclusion, is affirmed to be or to make a part of the class of creatures. Hence the conclusion necessarily and unavoidably follows, *viz. that man is accountable for his actions;* because if reason and liberty be that which constitutes a creature *accountable*, and *man* has reason and liberty, it is plain he has that which constitutes him *accountable*. In like manner, where the *major* is a negative proposition, or denies the *predicate of the conclusion* universally of the *middle term*, as the *minor* always asserts the *subject of the conclusion*, to be or make a part of that *middle term*, it is no less evident, that the *predicate of* the

the conclusion ought in this case to be denied of the *subject*. So that the ground of reasoning in all syllogisms of the first figure is manifestly this. *Whatever may be affirmed universally of any idea, may be affirmed of every or any number of particulars comprehended under that idea.* And again: *Whatever may be denied universally of any idea, may be in like manner denied of every or any number of its individuals.* These two propositions are called by logicians the *dictum de omni*, and *dictum de nullo*, and are indeed the great principles of syllogistic reasoning, inasmuch as all conclusions whatsoever either rest immediately upon them, or upon propositions deduced from them. But what adds greatly to their value is, that they are really self-evident truths, and such as we cannot gainsay without running into an express contradiction. To affirm, for instance, that *no man is perfect*, and yet argue that *some men are perfect*; or to say that *all men are mortal*, and yet that *some men are not mortal*, is to assert a thing to be and not to be at the same time.

And now we may affirm, that in all syllogisms of the first figure, if the *premisses* are true, the *conclusion* must needs be true. If it be true that the *predicate of the conclusion*, whether affirmative or negative, agrees universally to some idea, and if it be also true that the *subject of the conclusion* is a part of or comprehended under that idea, then it necessarily follows, that the *predicate of the conclusion* agrees also to the *subject*. For to assert the contrary, would be to run counter to some one of the two principles before established; that is, it would be to maintain an evident contradiction. And thus we are come at last to the point we have been all along endeavouring to establish, namely, That every proposition which can be demonstrated is necessarily true. For as every demonstration may be resolved into a series of syllogisms all in the first figure, and as, in any one of these syllogisms, if the premisses are true, the conclusion must be so too; it evidently follows, that if all the several premisses are true, all the several conclusions are so, and consequently the conclusion also of the last syllogism, which is always the proposition to be demonstrated. Now that all the premisses of a demonstration are true, will easily appear from the very nature and definition of that form of reasoning. A demonstration is a series of syllogisms, all whose premisses are either definitions, self-evident truths, or propositions already established. Definitions are identical propositions, wherein we connect the description of an idea with the name by which we chuse to have that idea called; and therefore as to their truth there can be no dispute. Self-evident propositions appear true of themselves, and leave no doubt or uncertainty in the mind. Propositions before established are no other than conclusions gained by one or more steps from definitions and self-evident principles, that is, from true premisses, and therefore must needs be true. Whence all the previous propositions of a demonstration being manifestly true, the last conclusion or proposition to be demonstrated must be so too. So that demonstration not only leads to certain truth, but we have here also a clear view of the ground and foundation of that certainty. For as, in demonstrating, we may be said to do nothing more than combine a series of syllogisms together, all resting on the same bottom; it is plain, that one uniform ground of certainty runs through the whole, and that the conclusions are every where built upon some one of the two principles before established as the foundation of all our reasoning. These two principles are easily reduced into one, and may be expressed thus. *Whatever predicate, whether affirmative or negative, agrees universally to any idea, the same must needs agree to every or any number of individuals comprehended under that idea.* And thus we have reduced the certainty of demonstration to one simple and universal principle, which carries its own evidence along with it, and which is indeed the ultimate foundation of all syllogistic reasoning.

Demonstration therefore serving as an infallible guide to truth, and standing on so sure and unalterable a basis, we may now venture to assert, that the rules of logic furnish a sufficient *criterion* for the distinguishing between truth and falsehood. For since every proposition that can be demonstrated is necessarily true, he is able to distinguish truth from falsehood, who can with certainty judge when a proposition is duly demonstrated. Now a demonstration is nothing more than a concatenation of syllogisms, all whose premisses are definitions, self-evident truths, or propositions previously established. To judge therefore of the validity of a demonstration, we must be able to distinguish, whether the definitions that enter it are genuine, and truly descriptive of the ideas they are meant to exhibit; whether the propositions assumed without proof as intuitive truths have really that self-evidence to which they lay claim; whether the syllogisms are drawn up in due form, and agreeable to the laws of argumentation; in fine, whether they are combined together in a just and orderly manner, so that no demonstrable propositions serve any where as premisses, unless they are conclusions of previous syllogisms. Now it is the business of logic, in explaining the several operations of the mind, fully to instruct us in all these points. It teaches the nature and end of definitions, and lays down the rules by which they ought to be framed. It unfolds the several species of propositions, and distinguishes the self-evident from the demonstrable. It delineates also the different forms of syllogisms, and explains the laws of argumentation proper to each. In fine, it describes the manner of combining syllogisms, so as that they may form a train of reasoning, and lead to the successive discovery of truth. The precepts of logic therefore, as they enable us to judge with certainty when a proposition is duly demonstrated, furnish a sure *criterion* for the distinguishing between truth and falsehood.

But perhaps it may be objected, that demonstration is a thing very rare and uncommon, as being the prerogative of but a few sciences, and therefore the *criterion* here given can be of no great use. But where ever, by the bare contemplation of our ideas, truth is discoverable, there also demonstration may be attained. Now that is an abundantly sufficient *criterion*, which enables us to judge with certainty in all cases where the knowledge of truth comes within our reach; for with discoveries, that lie beyond the limits of the human mind, we have properly no business. When a proposition is demonstrated, we are certain of its truth. When, on the contrary, our ideas

ideas are ſuch as have no viſible connection nor repugnance, and therefore furniſh not the proper means of tracing their agreement or diſagreement, there we are ſure that ſcientifical knowledge is not attainable. But where there is ſome foundation of reaſoning, which yet amounts not to the full evidence of demonſtration, there the precepts of logic, by teaching us to determine aright of the degree of proof, and of what is ſtill wanting to render it full and complete, enable us to make a due eſtimate of the meaſures of probability, and to proportion our aſſent to the grounds on which the propoſition ſtands. And this is all we can poſſibly arrive at, or even ſo much as hope for, in the exerciſe of faculties ſo imperfect and limited as ours.

We conclude it may not be improper to take notice of the diſtinction of demonſtration into *direct* and *indirect*. A *direct demonſtration* is, when beginning with definitions, ſelf-evident propoſitions, or known and allowed truths, we form a train of ſyllogiſms, and combine them in an orderly manner, continuing the ſeries through a variety of ſucceſſive ſteps, until at laſt we arrive at a ſyllogiſm, whoſe concluſion is the propoſition to be demonſtrated. Proofs of this kind leave no doubt or uncertainty behind them, becauſe all the ſeveral premiſſes being true, the concluſions muſt be ſo too, and of courſe the very laſt concluſion or propoſition to be proved. The other ſpecies of demonſtration is the *indirect*, or, as it is ſometimes called, the *apogogical*. The manner of proceeding here is, by aſſuming a propoſition which directly contradicts that we mean to demonſtrate, and thence by a continued train of reaſoning, in the way of a direct demonſtration, deducing ſome abſurdity or manifeſt untruth. For hereupon we conclude that the propoſition aſſumed was falſe, and thence again, by an immediate conſequence, that the propoſition to be demonſtrated is true. Thus *Euclid*, in his third book, being to demonſtrate, *that circles which touch one another inwardly have not the ſame centre*, aſſumes the direct contrary to this, *viz. that they have the ſame centre*, and thence by an evident train of reaſoning proves *that a part is equal to the whole*. That ſuppoſition therefore, leading to this abſurdity, he concludes to be falſe, *viz. that circles touching one another inwardly have the ſame centre*, and thence again immediately infers *that they have not the ſame centre*.

Now becauſe this manner of demonſtration is accounted by ſome not altogether ſo clear and ſatisfactory, we ſhall therefore endeavour here to ſhew, that it equally with the other leads to truth and certainty. Two propoſitions are ſaid to be *contradictory* one of another, when that which is aſſerted to be in the one is aſſerted not to be in the other. Thus the propoſitions, *circles that touch one another inwardly have the ſame centre*, and *circles that touch one another inwardly have not the ſame centre*, are *contradictories*; becauſe the ſecond aſſerts the direct contrary of what is aſſerted in the firſt. Now in all contradictory propoſitions this holds univerſally, that one of them is neceſſarily true, and the other neceſſarily falſe. For if it be true, that circles which touch one another inwardly have not the ſame centre, it is unavoidably falſe that they have the ſame centre. On the other hand, if it be falſe that they have the ſame centre, it is neceſſarily true that they have not the ſame centre. Since therefore it is impoſſible for them to be both true or both falſe at the ſame time, it unavoidably follows, that one is neceſſarily true, and the other neceſſarily falſe. This then being allowed, if any two contradictory propoſitions are aſſumed, and one of them can by a clear train of reaſoning be demonſtrated to be falſe, it neceſſarily follows that the other is true. For as the one is neceſſarily true, and the other neceſſarily falſe, when we come to diſcover which is the falſe propoſition, we thereby alſo know the other to be true.

Now this is preciſely the manner of an indirect demonſtration. For there we aſſume a propoſition, which directly contradicts that we mean to demonſtrate, and having by a continued ſeries of proofs ſhewn it to be falſe, thence infer that its contradictory, or the propoſition to be demonſtrated, is true. As therefore this laſt concluſion is certain and unavoidable, let us next inquire, after what manner we come to be ſatisfied of the falſehood of the aſſumed propoſition, that ſo no poſſible doubt may remain as to the force and validity of demonſtrations of this kind. The manner then is plainly this. Beginning with the aſſumed propoſition, we, by the help of definitions, ſelf-evident truths, or propoſitions already eſtabliſhed, continue a ſeries of reaſoning in the way of a direct demonſtration, until at length we arrive at ſome abſurdity or known falſehood. Thus *Euclid*, from the ſuppoſition that circles touching one another inwardly have the ſame centre, deduces *that a part is equal to the whole*. Since therefore, by a due and orderly proceſs of reaſoning, we come at laſt to a falſe concluſion, it is manifeſt that all the premiſſes cannot be true. For were all the premiſſes true, the laſt concluſion muſt be ſo too. Now as to all the other premiſſes made uſe of in the courſe of reaſoning, they are manifeſt and known truths by ſuppoſition, as being either definitions, ſelf-evident propoſitions, or truths previouſly eſtabliſhed. The aſſumed propoſition is that only as to which any doubt or uncertainty remains. That alone therefore can be falſe, and indeed, from what has been already ſhewn, muſt unavoidably be ſo. And thus we ſee, that, in indirect demonſtrations, two contradictory propoſitions being laid down, one of which is demonſtrated to be falſe, the other, which is always the propoſition to be proved, muſt neceſſarily be true; ſo that here, as well as in the direct way of proof, we arrive at a clear and ſatisfactory knowledge of truth.

This is univerſally the method of reaſoning in all apogogical or indirect demonſtrations; but if any propoſition is aſſumed, from which in a direct train of reaſoning we can deduce its contradictory, the propoſition ſo aſſumed is falſe, and the contradictory one true. For if we ſuppoſe the aſſumed propoſition to be true, then, ſince all the other premiſſes that enter the demonſtration are alſo true, we ſhall have a ſeries of reaſoning, conſiſting wholly of true premiſſes; whence the laſt concluſion or contradictory of the aſſumed propoſition muſt be true likewiſe. So that by this means we ſhould have two contradictory propoſitions both true at the ſame time, which is manifeſtly impoſible. The aſſumed propoſition therefore, whence this abſurdity flows, muſt neceſſarily be falſe, and conſequently its contradictory, which is here

here the propofition deduced from it, muft be true. If then any propofition is propofed to be demonftrated, and we *affume* the *contradictory* of that propofition, and thence directly infer the propofition to be demonftrated, by this very means we know that the propofition fo inferred is true. For fince from an affumed propofition we have deduced its contradictory, we are thereby certain that the affumed propofition is falfe; and if fo, then its contradictory, or that deduced from it, which in this cafe is the fame with the propofition to be demonftrated, muft be true.

We have a curious inftance of this in the twelfth propofition of the ninth book of the elements. *Euclid* there propofes to demonftrate, *that in any feries of numbers, rifing from unity in geometrical progreffion, all the prime numbers that meafure the laft term in the feries will alfo meafure the next after unity.* In order to this, he affumes the contradictory of the propofition to be demonftrated, namely; *that fome prime number meafuring the laft term in the feries, does not meafure the next after unity;* and thence, by a continued train of reafoning, proves, that it actually does meafure it. Hereupon he concludes the affumed propofition to be falfe, and that which is deduced from it, or its contradictory, which is the very propofition he propofed to demonftrate, to be true. Now that this is a juft and conclufive way of reafoning, is abundantly manifeft from what we have fo clearly eftablifhed above.

Having thus fufficiently evinced the certainty of demonftration in all its branches, and fhewn the rules by which we ought to proceed, in order to arrive at a juft conclufion, according to the various ways of arguing made ufe of; it is needlefs to enter upon a particular confideration of thofe feveral fpecies of falfe reafoning, which logicians diftinguifh by the name of *fophifms*. He that throughly underftands the form and ftructure of a good argument, will of himfelf readily difcern every deviation from it. And although *fophifms* have been divided into many claffes, which are all called by founding names, that therefore carry in them much appearance of learning; yet are the errors themfelves fo very palpable and obvious, that it is loft labour to write for a man capable of being mifled by them. Here therefore we chufe to conclude this fecond part of logic, and fhall in the next part give fome account of *method*, which, though infeparable from reafoning, is neverthelefs always confidered by logicians as a diftinct operation of the mind; becaufe its influence is not confined to the mere exercife of the reafoning faculty, but extends in fome degree to all the tranfactions of the underftanding.

PART III. *Of* METHOD.

Of method in general, and the divifion of it into analytick and fynthetick.

WE have now done with the two firft operations of the mind, whofe office it is to fearch after truth, and enlarge the bounds of human knowledge. There is yet a third, which regards the difpofal and arrangement of our thoughts, when we endeavour fo to put them together that their mutual connection and dependence may be clearly feen. This is what logicians call *method*, and place always the laft in order in explaining the powers of the underftanding; becaufe it neceffarily fuppofes a previous exercife of our other faculties, and fome progrefs made in knowledge, before we can exert it in any extenfive degree.

In this view it is plain, that we muft be before-hand well acquainted with the truths we are to combine together; otherwife how could we difcern their feveral connections and relations, or fo difpofe of them as their mutual dependence may require? But it often happens, that the underftanding is employed, not in the arrangement and compofition of known truths, but in the fearch and difcovery of fuch as are unknown. And here the manner of proceeding is very different. We affemble at once our whole ftock of knowledge relating to any fubject; and, after a general furvey of things, begin with examining them feparately and by parts. Hence it comes to pafs, that whereas, at our firft fetting out, we were acquainted only with fome of the grand ftrokes and outlines of truth, by thus purfuing her through her feveral windings and receffes we gradually difcover thofe more inward and finer touches whence fhe derives all her ftrength, fymmetry, and beauty. And here it is, that when, by a narrow fcrutiny into things, we have unravelled any part of knowledge, and traced it to its firft and original principles, infomuch that the whole frame and contexture of it lies open to the view of the mind; here it is, that taking it the contrary way, and beginning with thefe principles, we can fo adjuft and put together the parts, as the order and method of fcience requires.

But as thefe things are beft underftood when illuftrated by examples; let us fuppofe any machine, for inftance a watch, prefented to us, whofe ftructure and compofition we are as yet unacquainted with, but want if poffible to difcover. The manner of proceeding in this cafe is, by taking the whole to pieces, and examining the parts feparately one after another. When by fuch a fcrutiny we have throughly informed ourfelves of the frame and contexture of each, we then compare them together, in order to judge of their mutual action and influence. By this means we gradually trace out the inward make and compofition of the whole, and come at length to difcern, how parts of fuch a form, and fo put together, as we found in unravelling and taking them afunder, conftitute that particular machine called a watch, and contribute to all the feveral motions and phænomena obfervable in it. This difcovery being made, we can take things the contrary way, and, beginning with the parts, fo difpofe and connect them, as their feveral ufes and ftructures require, until at length we arrive at the whole itfelf, from the unravelling of which thefe parts refulted.

And as it is in tracing and examining the works of art, fo is it in a great meafure in unfolding any part of human knowledge. For the relations and mutual habitudes of things do not always immediately appear upon comparing them one with another. Hence we have recourfe to intermediate ideas, and by means of them are furnifhed with

with thoſe previous propoſitions, that lead to the concluſion we are in queſt of. And if it ſo happen, that the previous propoſitions themſelves are not ſufficiently evident, we endeavour by new middle terms to aſcertain their truth, ſtill tracing things backward in a continued ſeries, until at length we arrive at ſome ſyllogiſm where the premiſſes are firſt and ſelf-evident principles. This done, we become perfectly ſatisfied as to the truth of all the concluſions we have paſſed through, in as much as they are now ſeen to ſtand upon the firm and immoveable foundation of our intuitive perceptions. And as we arrived at this certainty by tracing things backward to the original principles whence they flow, ſo may we at any time renew it by a direct contrary proceſs, if, beginning with theſe principles, we carry the train of our thoughts forward, until they lead us by a connected chain of proofs to the very laſt concluſion of the ſeries.

Hence it appears, that in diſpoſing and putting together our thoughts, either for our own uſe, that the diſcoveries we have made may at all times lie open to the review of the mind, or where we mean to communicate and unfold theſe diſcoveries to others, there are two ways of proceeding equally within our choice. For we may ſo propoſe the truths relating to any part of knowledge, as they preſented themſelves to the mind in the manner of inveſtigation, carrying on the ſeries of proofs in a reverſe order, until they at laſt terminate in firſt principles: or, beginning with theſe principles, we may take the contrary way, and from them deduce, by a direct train of reaſoning, all the ſeveral propoſitions we want to eſtabliſh. This diverſity in the manner of arranging our thoughts gives riſe to the twofold diviſion of method eſtabliſhed among logicians. For method, according to their uſe of the word, is nothing elſe but the order and diſpoſition of our thoughts relating to any ſubject. When truths are ſo propoſed and put together, as they were or might have been diſcovered, this is called the *analytick method*, or the *method of reſolution;* in as much as it traces things backward to their ſource, and *reſolves* knowledge into its firſt and original principles. When, on the other hand, they are deduced from theſe principles, and connected according to their mutual dependence, inſomuch that the truths firſt in order tend always to the demonſtration of thoſe that follow, this conſtitutes what we call the *ſynthetick method*, or *method of compoſition*; for here we proceed by gathering together the ſeveral ſcattered parts of knowledge, and *combining* them into one whole ſyſtem, in ſuch manner, that the underſtanding is enabled diſtinctly to follow truth through all her different ſtages and gradations.

There is this farther to be taken notice of, in relation to theſe two ſpecies of method; that the firſt has alſo obtained the name of the *method of invention*, becauſe it obſerves the order in which our thoughs ſucceed one another in the *invention* or diſcovery of truth. The other again is often denominated the *method of doctrine* or *inſtruction;* in as much as, in laying our thoughts before others, we generally chuſe to proceed in the *ſynthetick* manner, deducing them from their firſt principles. For we are to obſerve, that although there is great pleaſure in purſuing truth in the method of inveſtigation, becauſe it places us in the condition of the inventor, and ſhews the particular train and proceſs of thinking by which he arrived at his diſcoveries; yet is it not ſo well accommodated to the purpoſes of evidence and conviction. For at our firſt ſetting out, we are commonly unable to divine where the analyſis will lead us, inſomuch that our reſearches are for ſome time little better than a mere groping the dark. And even after light begins to beak in upon us, we are ſtill obliged to many reviews, and a frequent compariſon of the ſeveral ſteps of the inveſtigation among themſelves. Nay, when we have unravelled the whole, and reached the very foundation on which our diſcoveries ſtand, all our certainty in regard to their truth will be found in a great meaſure to ariſe from that connection we are now able to diſcern between them and firſt principles taken in the order of compoſition. But in the ſynthetick manner of diſpoſing our thoughts, the caſe is quite different. For as we here begin with intuitive truths, and advance by regular deductions from them, every ſtep of the procedure brings evidence and conviction along with it; ſo that in our progreſs from one part of knowledge to another, we have always a clear perception of the ground on which our aſſent reſts. In communicating therefore our diſcoveries to others, this method is apparently to be choſen, as it wonderfully improves and enlightens the underſtanding, and leads to an immediate perception of truth.

LOHOCH, or LOCH, in pharmacy, a compoſition of a middle conſiſtence between a ſoft electuary and a ſyrup, principally uſed in diſorders of the lungs.

There are ſeveral kinds of lohochs, denominated from the principal ingredient that enters into their compoſition. The common lohoch is made thus: take of freſh drawn oil of ſweet almonds, and of pectoral or balſamic ſyrup, one ounce; white-ſugar, two drams: mix, and make them into a lohoch.

LOINS, in anatomy. the two lateral parts of the umbilical region of the abdomen. See ANATOMY.

LOIRE, the largeſt river in France, riſes in the mountains of the Cevennes, and, after running a courſe of about five hundred miles, falls into the bay of Biſcay.

LOLIUM, DARNEL, in botany, a genus of the triandria digynia claſs. The involucrum conſiſts of one leaf; it has no calix; and the ſtipula conſiſts of many flowers. There are three ſpecies, two of them natives of Britain, *viz.* the perenne, or perennial darnel-graſs; and the temulentum, or annual darnel-graſs.

LOMBARDY, a kingdom which comprehended almoſt all Italy. It was erected by the Longobards, or Lombards, a German nation, about the year 598, and laſted till Charlemain put an end to it about the year 760.

LOMMOND, a lake in the county of Lenox, in Scotland, which runs almoſt the whole length of the county.

LONCHITIS, SPLEEN-WORT, in botany, a genus of the cryptogamia filicum claſs of plants, the fructifications of which are arranged into lunulated ſeries, and diſpoſed ſeparately under the ſinuſes of the leaves.

There

There are four ſpecies, none of them natives of Britain.

LONDON, the metropolis of Great Britain, where the firſt meridian is fixed on the Britiſh maps, lies in 51° 32′ N. lat. on the river Thames, and the greateſt part on the north ſide of that river. The form of London, including Weſtminſter and Southwark, comes pretty near an oblong ſquare, five miles in length, if meaſured in a direct line from Hyde-Park to the end of Limehouſe, and ſix miles if we follow the windings of the ſtreets; the greateſt breadth is two miles and a half, and the circumference of the whole ſixteen or ſeventeen miles, but it is not eaſy to meaſure it exactly, on account of its irregular form. The principal ſtreets are generally level, exceeding well built, and extended to a very great length; theſe are inhabited by tradeſmen, whoſe houſes and ſhops make a much better figure than thoſe of any tradeſmen in Europe. People of diſtinction uſually reſide in elegant ſquares, of which there are great numbers at the weſt end of the town near the court. What moſtly contributes to the riches and glory of this city, is the port, whither ſeveral thouſand ſhips of burden annually reſort from all countries, and where the greateſt fleets never fail to meet with wealthy merchants ready to take off the richeſt cargoes. The number of perſons in the whole place are computed to be about eight hundred thouſand.

LONDONDERRY, a city of Ireland, in the province of Ulſter, and county of Londonderry, ſituated on the river Mourn, near its mouth, in W. long. 7° 40′, N. lat. 54° 52′.

LONG, an epithet given to whatever exceeds the uſual ſtandard of length; thus, we ſay a long-boat, long accent, *&c.*

LONGÆVITY, length of life.

Lord Bacon obſerves, that the ſucceſſion of ages, and of the generation of men, ſeems no way to ſhorten the length of human life, ſince the age of man, down from Moſes's time to the preſent, has ſtood at about eighty years, without gradually declining, as one might have expected. The greateſt inſtances of longævity in theſe our iſlands, are that of old Parr, who lived almoſt 153 years; of Jenkins, of Yorkſhire, who lived 169 years; or of the counteſs Deſmond, or Mr Eckleſton, both of Ireland, who each exceeded 140 years.

LONGFORD, a county of Ireland, in the province of Leinſter, bounded by the county of Letrim and Cavan on the north, by Meath on the eaſt and ſouth, and by Roſcommon on the weſt.

LONG-ISLAND, an iſland belonging to New-York in North America, lying between 71° and 74° W. long. and in 41° 30′ N. lat.

LONGIMETRY, the art of meaſuring lengths, both acceſſible and inacceſſible. See GEOMETRY.

LONGINICO, a town of the Morea, in Europe, ſituated on the river Alpheus, fifty miles ſouth of Lepanto: being the ancient Olympia, where Hercules inſtituted the Olympic games.

LONGISSMUS DORSI, in anatomy. See ANATOMY, p. 218.

LONGITUDE *of a ſtar*, in aſtronomy, an arch of the ecliptic, intercepted between the beginning of aries, and the point of the ecliptic cut by the ſtar's circle of longitude.

LONGITUDE *of a place*. See GEOGRAPHY.

In the philoſophical tranſactions, n° 1, we have an account of a ſucceſsful experiment in finding the longitude at ſea, made with two pendulum-watches by major Holmes, in a voyage from the coaſt of Guinea homewards. This and ſome other ſucceſſes encouraged Monſieur Huygens ſo far, that, after he had improved the ſtructure of theſe watches, he publiſhed an account at large for the ſhewing how and in what manner theſe watches are to be uſed in finding the longitude at ſea, with directions for adjuſting of them and keeping a journal by them; which account the curious reader may ſee at large in the Philoſophical tranſactions, n° 47.

The chief objection againſt pendulum clocks and watches, is the effects that heat and cold have upon the ſpring and pendulum, which make the ſpring in watches draw ſtronger at ſome times than at other times, and cauſes the pendulum to lengthen and ſhorten, according as the weather is hotter or colder; but theſe effects are ſo regular, that without doubt they may be accounted for.

But the moſt ingenious and ſucceſsful machines for this purpoſe have been invented by Mr. John Harriſon, who, at different times, contrived three different time-pieces for determining the longitude at ſea.

The firſt of Mr. Harriſon's machines was tried in May 1736, when it was put on board a man of war; and by its exact meaſure of time, in its return from Liſbon, corrected an error of almoſt a degree and an half in the computations of the reckoning of a ſhip. In 1739, Mr. Harriſon finiſhed his ſecond machine, which, from various experiments made upon it, was ſufficiently regular and exact for finding the longitude of a ſhip within the neareſt limits propoſed by parliament. Upon the ſucceſs of this, Mr. Harriſon, in 1741, undertook ſtill a more advantageous machine, which he finiſhed in 1758, when he applied to the commiſſioners of longitude for orders to make a trial of that inſtrument to ſome part in the Weſt Indies, as directed by the ſtatutes for the diſcovery of the longitude at ſea. In conſequence of this application, Mr. Harriſon received orders for his ſon to proceed from Portſmouth to Jamaica, in one of his majeſty's ſhips of war, with his third inſtrument, in November 1761; and the commiſſioners having directed that every requiſite ſtep and precaution ſhould be taken, for making, with care, the proper experiments, and aſcertaining their accuracy, not only going to Jamaica, but in the return, it appears, from the calculations made from the experiments in going to Jamaica, that the difference between the longitude, as found by the time-piece, and calculated by the obſervations of the tranſit of mercury in 1743 at Jamaica and London, is five ſeconds of time, which at Jamaica is little more than a geographical mile.

During the voyage, Mr. Harriſon's time-piece corrected the ſhip's reckoning, which ſometimes erred about a degree and a half: and in going from Madeira

to

to Jamaica, it alſo corrected the errors of the log, and ſhewed the longitude ſo exactly, that the ſhip made the iſland of Deſeada, and all the other iſlands, until they arrived at Jamaica, as foretold by the time-piece. At the arrival at Jamaica, the obſervations for finding the time were made by equal altitudes; and the longitude ſhewn by the time-piece, being within 5″ of time of the longitude ſhewn by the moſt accurate obſervations of mercury in its tranſit over the ſun in the year 1743, and with which all the obſervations at London and Paris agreeing within 23″, amounts to a demonſtration, that Mr. Harriſon has performed all that is required by the ſtatute of the 12th of queen Anne, to entitle him to the greateſt reward mentioned in that act. In returning from Jamaica, the weather was very tempeſtuous, ſo that the time piece was forced to be placed on the counter, to avoid being perpetually expoſed to the ſea water; there it ſuffered continual violent agitations, which, though they neceſſarily retarded its motion, yet did not occaſion any ſuch conſiderable error, as would have made Mr. Harriſon's right to the greateſt reward queſtionable, had it depended on this voyage only; for the time-keeper, in its going and return, loſt only 1′ 54″ and ½, which, in the latitude of Portſmouth, amounts to about eighteen geographical miles or minutes of a great circle, whereas the act required only that it ſhould come within the diſtance of thirty geographical miles or minutes of a great circle.

LONGITUDINAL, in general, denotes ſomething placed lengthwiſe; thus ſome of the fibres of the veſſels in the human body are placed longitudinally, others tranſverſely or acroſs.

LONGUEVILLE, a town of Normandy in France, twenty miles north of Rouen: E. long. 1° 10′, N. lat. 49° 50′

LONICERA, in botany, a genus of the pentandria monogynia claſs. The corolla conſiſts of one irregular petal; and the berry of two cells containing many ſeeds. There are 13 ſpecies, only one of which, *viz.* the periclymenum, or common honey-ſuckle, is a native of Britain.

LOOF, in the ſea language, is a term uſed in various ſenſes: thus, the loof of a ſhip is that part of her aloft, which lies juſt before the cheſt tree; hence the guns which lie there are called loof-pieces: keep your loof, ſignifies, keep the ſhip near to the wind; to loof into a harbour, is to ſail into it cloſe by the wind; loof up, is to keep nearer the wind; to ſpring the loof, is when a ſhip that was going large before the wind, is brought cloſe by the wind.

LOOKING-GLASSES, are nothing but plain mirrours of glaſs; which being impervious to the light, reflect the images of things placed before them; for the theory whereof, ſee OPTICS.

LOOM, a frame compoſed of a variety of parts, uſed in all the branches of weaving. See WEAVING.

LOOSING of arreſtment, in Scots law. See LAW, Tit. xxv. 6.

LOPHIUS, in zoology, a genus of the branchioſtegious order of fiſhes, whoſe head is in ſize equal to all the reſt of the body: the head and body are both of a depreſſed form: there are a number of fleſhy pinnules or apendages ſurrounding the whole body of the fiſh. There are three ſpecies.

LORANTHUS, in botany, a genus of the hexandria monogynia claſs. The margin of the calix is entire; the corolla conſiſts of ſix ſegments folded backwards; and the berry contains one ſeed. There are five ſpecies, none of them natives of Britain.

LORD, a title of honour, given to thoſe who are noble, either by birth or creation; in this ſenſe it amounts to much the ſame as peer of the realm, or lord of Parliament. This title is, by courteſy, alſo given to all the ſons of dukes and marquiſes, and to the eldeſt ſons of earls; and it is alſo a title of honour beſtowed on thoſe who are honourable by their employments, as lord advocate, lord chamberlain, lord chancellor, *&c.*

LORETTO, a city of Italy, in the marquiſate of Ancona, in the pope's territories, 145 miles eaſt of Rome. This place is famous for the chamber of the bleſſed Virgin, which, according to the Roman catholic tradition, was brought by angels from Paleſtine to Dalmatia, and from thence tranſported over into Italy, and fixed at Loretto.

LORN, the north part of Argyleſhire in Scotland, bounded by Lochabar on the north, by Broadalbin on the eaſt, by the reſt of Argyleſhire on the ſouth, and by the ſea on the weſt.

LORRAIN, a duchy formerly belonging to the circle of the Upper Rhine in Germany, but now united to the crown of France. It is bounded by the duchy of Luxemburg on the north; by Alſatia, the duchy of Deux ponts, and the palatinate of the Rhine, on the eaſt; by the county of Burgundy, on the ſouth; and by Champaign, on the weſt.

LOTHIAN, a county of Scotland, bounded by the frith of Forth on the north; by the German ſea, on the eaſt; by Clydeſdale, Tweedale, and Merſe, on the ſouth; and by Stirling, on the weſt. The capital of this county is Edinburgh.

LOTION is, ſtrictly ſpeaking, ſuch waſhing as concerns beautifying the ſkin, by cleanſing it of thoſe deformities which a diſtempered blood ſometimes throws upon it, or rather are made by a preternatural ſecretion: for according to Quincy, generally thoſe diſtempers of the ſkin, commonly accounted ſigns of a foul blood, are, from thoſe ſalts which are natural in the beſt conſtitution, thrown off by the cutaneous glands, which ought to be waſhed away through the kidney; ſo that inſtead of thoſe inſignificant and ridiculous tribes of ſweeteners, which in this caſe are frequently uſed, promoting the urinary diſcharge, or rectifying that of the ſkin by proper waſhes, frictions, or ointments, or both together, is the only way to get rid of ſuch diſorders.

LOTTERY, a kind of public game at hazard, frequent in Britain, France, and Holland, in order to raiſe money for the ſervice of the ſtate; being appointed with us by the authority of parliament, and managed by commiſſioners appointed by the lords of the treaſury for that purpoſe. It conſiſts of ſeveral numbers of blanks and prizes, which are drawn out of wheels, one of

of which contains the numbers, and the other the corresponding blanks or prizes.

LOTUS, in botany, a genus of the diadelphia decandria class. The legumen is cylindrical; the wings are connivent above; and the calix is tubular. There are 17 species, only one of which, *viz.* the corniculata, or birds-foot trefoil, is a native of Britain.

LOVAGE, in botany. See LIGUSTICUM.

LOVE APPLE. See SOLANUM.

LOUIS, or *Knights of St.* LOUIS, the name of a military order in France, instituted by Louis XIV. in 1693. Their collars are of a flame colour, and pass from left to right; the king is their grand master. There are in it eight great crosses, and twenty four commanders; the number of knights is not limited. At the time of their institution, the king charged his revenue with a fund of three hundred thousand livres for the pensions of the commanders and knights.

LOUISIANA, or NEW FRANCE, a country of north America, bounded by the river and lake of Illenois on the north, North Carolina on the east, and the gulph of Mexico on the south.

LOUSE, in zoology. See PEDICULUS.

LOUTH, a county of Ireland, in the province of Leinster, bounded by Monaghan and Armagh on the north, by the Irish Channel on the east, by East Meath on the south; and by Cavan on the west.

LOUVAIN, a city of the Austrian Netherlands, in the province of Brabant, situated on the river Dyle, fifteen miles north-east of Brussels.

LOWERING, among distillers, a term used to express the debasing the strength of any spiritous liquors, by mixing water with it.

LOXIA, in zoology, the name of a genus of birds of the order of the passeres; the distinguishing characters of which are, that the tongue is plain, equal and whole; the beak large, thick, and short, and crooked and convex both ways. There are 48 species, principally distinguished by their colour.

LOZENGE, in heraldry, a rhombus, or figure of equal sides, but unequal angles, resembling a quarry of glass in our old windows, placed erect, point ways. It is in this figure that all unmarried gentlewomen and widows bear their coats of arms, because, as some say, it was the figure of the Amazonian shield; or, as others, because it is the ancient figure of the spindle. Plate CIII. fig. 8. represents an ordinary of lozenges.

The lozenge differs from the fusil, in that the latter is narrower in the middle, and not so sharp at the ends.

LUBEC, a city and port-town of Germany, in the circle of Lower Saxony, and duchy of Holstein, situated ten miles south-west of the Baltic sea: E. long. 10° 35′, N. lat. 54° 20′.

LUBEN, a town of Germany, in the circle of Upper Saxony, and marquisate of Lusatia: E. long. 14° 25′, N. lat. 52°.

LUBLIN, a city of Poland, in the palatinate of the same name: E. long. 22° 15′, N. lat. 51° 30′.

LUBOW, a town of Poland, in the palatinate of Cracow: E. long. 20° 30′, N. lat. 49° 30′.

LUC, a town of Provence, in France, twenty-three miles north-east of Toulon.

LUCAR, or *St* LUCAR, a port-town of Spain, in the province of Andalusia: W. long. 6° 38, N. lat 36° 42′.

St LUCAR is also a town of Andalusia, in Spain: W. long. 8° 12, N. lat. 37° 20.

St LUCAR is also the name of another town of Spain, fifteen miles west of Seville.

LUCARNO, a town of the duchy of Milan, situated on the lake of Maggiore, but subject to Switzerland.

LUCCA, the capital of the republic of the same name in Italy, situated twelve miles east of the Tuscan sea: E. long. 11° 20′, N. lat. 43° 45′.

LUCERN, the capital of the canton of the same name in Switzerland, situated on the lake Lucern, to which it gives its name: E. long. 8° 12′, N. lat. 47°.

LUCERNE, in botany. See MEDICAGO. For the culture of lucerne, see AGRICULTURE, p. 65.

LUCIA-ISLANDS, one of the Caribbee islands in America, situated seventy miles north-west of Barbadoes, being twenty-two miles long, and eleven broad.

St. LUCIA, one of the Cape Verd islands in Africa, lying in W. long. 25°, N. lat. 16° 30′.

LUCIOPERCA, in ichthyology. See PERCA.

LUCIUS, in ichthyology. See ESOX.

LUCONIA, or MANILLA, the chief of the Philippine islands, situated between 117° and 123° E. long. and between 12° and 19° of N. lat.

LUDLOW, a borough of Shropshire, situated on the river Corve; eighteen miles south of Shrewsbury. It sends two members to parliament.

LUDWIGIA, in botany, a genus of the tetrandria monogynia class. The corolla consists of four petals, and the calix of four segments; the capsule has four sides and four cells, with many seeds. There are two species, none of them natives of Britain.

LUES, among physicians, is, in general, used for a disease of any kind; but, in a more particular sense, is restrained to contagious and pestilential diseases: thus, the lues gallica, or venerea, signifies the venereal disease. See MEDICINE.

LUGGERSHAL, a borough-town, ten miles north of Salisbury. It sends two members to parliament.

LUGO, a city and bishop's see of Spain, sixty miles east of Compostella: W. long. 7° 50′, and N. lat. 43° 5′.

LUKE, or *gospel of St.* LUKE, a canonical book of the New Testament.

Some think it was properly St. Paul's gospel, and that when that apostle speaks of his gospel, he means what is called St. Luke's. Irenæus says, that St. Luke digested into writing what St. Paul preached to the Gentiles; and Gregory Nazianzen tells us, that St. Luke wrote with the assistance of St. Paul.

St. LUKE *the evangelist's day*, a festival in the Christian church, observed on the 18th of October.

LULA-LAPMARK, a province of Sweden, bounded on the north by that of Torne; on the east, by the Bothnic gulph; on the south, by Pithia-lapmark; and on the west, by Norway.

LUMBAGO,

LUMBAGO, in medicine, denotes a pain about the loins, as that preceding fevers, agues, and the rheumatiſm.

LUMBARIS, a name given to the arteries and veins which ſpread over the loins. See ANATOMY.

LUMBRICAL, a name given to four muſcles of the fingers, and to as many of the toes. See ANATOMY, part II.

LUMBRICUS, the EARTH-WORM, in zoology, a genus of inſects belonging to the order of vermes inteſtina. The body is cylindrical, annulated, with an elevated belt near the middle. There is but one ſpecies of this animal. It lives under ground, and feeds upon the ſeeds and roots of plants. It comes above ground in the night, or during rain, for the purpoſe of copulation. For the effects of theſe animals in the human body, and the method of expelling them, ſee MEDICINE.

LUMME, in ornithology. See COLYMBUS.

LUMP-FISH. See CYCLOPTERUS.

LUNA, in aſtronomy, the moon. See ASTRONOMY.

LUNAR, ſomething belonging to the moon; thus we ſay, lunar month, lunar year, &c.

LUNARIA, HONESTY, in botany, a genus of the tetradynamia ſiliculoſa claſs. The ſilicula, or pod, is entire, elliptical, and compreſſed; with plain, equal, parallel valves There are two ſpecies, none of them natives of Britain.

LUNATIC, a perſon affected with lunacy. See MEDICINE.

LUND, or LUNDEN, a city of Sweden, in the province of Gothland, the capital of the territory of Schonen, ſituated thirty miles eaſt of Copenhagen.

LUNDY, a little iſland in the mouth of the Briſtol-channel: W. long. 4° 50′, N. lat. 51° 25′.

LUNENBURG, the capital of the duchy of the ſame name, thirty miles ſouth-eaſt of Hamburg: E. long. 10° 20′, N. lat. 53° 35′.

LUNGS. See ANATOMY, p. 280.

LUNG-WORT, in botany. See PULMONARIA.

LUNISOLAR YEAR, in chronology, the ſpace of 532 common years; found by multiplying the cycle of the ſun by that of the moon.

LUNULA, in geometry, a plane figure like a creſcent or half moon.

LUPERCALIA, a feſtival of the ancient Romans in honour of the god Pan, obſerved on the 15th of February, and ſo called from luperci, the prieſts of that fabulous deity.

LUPINUS, in botany, a genus of the diadelphia decandria claſs. The calix conſiſts of two lips; five of the antheræ are oblong, and the other five round; and the pod is coreaceous. There are ſeven ſpecies, none of them natives of Britain.

LUPULUS, in botany, &c. See HUMULUS.

LUPUS, in zoology. See CANIS.

LUPUS MARINUS. See ANARRICHAS.

LUPUS, in aſtronomy See ASTRONOMY, p. 487.

LURE, in falconry, a device of leather, in the form of a bird, with two wings ſtuck with feathers and baited with a piece of fleſh; wherewith to reclaim or call back a hawk, when at a conſiderable diſtance.

LUSATIA, a marquiſate of Upper Saxony, bounded by Brandenburg, on the north; by Sileſia, on the eaſt; by Bohemia, on the ſouth; and by the duchy of Saxony, on the weſt: it is ſubject to the king of Poland.

LUSTRATION, in antiquity, ſacrifices or ceremonies by which the ancients purified their cities, fields, armies, or people, defiled by any crime or impurity.

Some of theſe luſtrations were public, others private. There were three ſpecies or manners of performing luſtration, *viz.* by fire and ſulphur, by water, and by air; which laſt was done by fanning and agitating the air round the thing to be purified. Some of theſe luſtrations were neceſſary, that is, could not be diſpenſed with, as luſtrations of houſes in time of a plague, or upon the death of any perſon; others again were done out of choice, and at pleaſure. The public luſtrations at Rome were celebrated every fifth year, in which they led a victim thrice round the place to be purified, and in the mean time burnt a great quantity of perfumes.

LUSTRE, the gloſs or brightneſs appearing on any thing, particularly on manufactures of ſilk, wool, or ſtuff. It is likewiſe uſed to denote the compoſition or manner of giving that gloſs.

The luſtre of ſilks is given them by waſhing in ſoap, then clear water, and dipping them in alum water cold. To give ſtuffs a beautiful luſtre, for every eight pounds of ſtuff allow a quarter of a pound of linſeed; boil it half an hour, and then ſtrain it through a cloth, and let it ſtand till it is turned almoſt to a jelly: afterwards put an ounce and a half of gum to diſſolve twenty four hours; then mix the liquor, and put the cloth into this mixture; take it out, dry it in the ſhade, and preſs it. If once doing is not ſufficient, repeat the operation. Curriers give a luſtre to black leather firſt with juice of bar berries, then with gum arabic, ale, vinegar, and flanders glue, boiled together. For coloured leather, they uſe the white of an egg beaten in water. Moroccoes have their luſtre from juice of bar-berries and lemon or orange. For hats, the luſtre is frequently given with common water, ſometimes a little black dye is added: the ſame luſtre ſerves for furs, except that for very black furs they ſometimes prepare a luſtre of galls, copperas, Roman alum, ox's marrow, and other ingredients.

LUSTRUM, in Roman antiquity, a general muſter and review of all the citizens and their goods, which was performed by the cenſors every fifth year, who afterwards made a ſolemn luſtration. See LUSTRATION.

LUTE, or LUTING, among chemiſts. See CHEMISTRY, p. 116.

LUTE, is alſo a muſical inſtrument with ſtrings.

The lute conſiſts of four parts, *viz.* the table; the body or belly, which has nine or ten ſides; the neck, which has nine or ten ſtops or diviſions, marked with ſtrings; and the head, or croſs, where the ſcrew for raiſing and lowering the ſtrings to a proper pitch of tone are fixed. In the middle of the table there is a roſe or paſſage for the ſound; there is alſo a bridge that the ſtrings are faſtened to, and a piece of ivory between

between the head and the neck to which the other extremities of the ftrings are fitted. In playing, the ftrings are ftruck with the right hand, and with the left the ftops are preffed. The lutes of Bologna are efteemed the beft, on account of the wood, which is faid to have an uncommon difpofition for producing a fweet found.

LUTHERANS, the Chriftians who follow the opinions of Martin Luther, one of the principal reformers of the church in the fixteenth century.

This fect took its rife from the diftafte taken at the indulgences which were granted in 1517, by pope Leo X. to thofe who contributed towards finifhing St. Peter's church at Rome. John Stuptize, vicar general of the Auguftines in Germany, was the firft who took occafion to declare againft thefe abufes, for which purpofe he made ufe of Martin Luther, the moft learned of all the Auguftines. Luther was a native of Eifleben, in the county of Mansfield in Saxony, and taught divinity at the univerfity of Wirtemberg; he mounted the pulpit, and declaimed vehemently againft the abufe of indulgences, and even fixed ninety-five propofitions upon the church-doors of Wirtemberg, in order to their being confidered and examined in a public conference: againft thefe John Tetzel, a Dominican, publifhed a hundred and fix pofitions at Francfort upon the Oder; and by virtue of his office of inquifitor, ordered thofe of Luther to be burnt; when his adherents, to revenge the affront, publicly burnt at Wirtemberg thofe of Tetzel. Thus war was declared between the Dominicans and Auguftines, and foon after between the Roman catholic and the Lutheran party. In 1520, Luther fent his book De Libertate Chriftiana, to the pope; in which he grounds juftification upon faith alone, without the affiftance of good works; and afferts, that Chriftian liberty refcues us from the bondage of human traditions, and particularly the flavery of papal impofitions; and afterwards, in a remonftrance written in high Dutch, he proceeded to deny the authority of the church of Rome. He was the fame year excommunicated by the pope; upon which Luther caufing a large fire to be made without the walls of Wirtemberg, threw the pope's bull into it with his own hands, together with the decretals, extravagants, and clementines; and this example was followed by his difciples in other towns. The next year the emperor Charles V. ordered his books to be burnt, and put him under the ban of the empire as a heretic and fchifmatic; and about this time king Henry VIII. of England wrote againft him in defence of the feven facraments, to which Luther wrote a reply.

The elector of Saxony, who had for fome time kept him concealed in his caftle of Wefburg, now gave him leave to reform the churches of Wirtemberg as he thought fit; when this reformer propofed, that the bifhops, abbots, and monks, fhould be expelled; that all the lands and revenues of the bifhoprics, abbeys, and monafteries, fhould efcheat to the refpective princes; and that all the convents of mendicant friars fhould be turned into public fchools and hofpitals: this year, Luther had the fatisfaction to fee a league contracted between Guftavus king of Sweden, and Frederick king of Denmark, who both agreed to eftablifh Lutheranifm in their dominions: and now Luther's perfuafion, which from the Upper Saxony had fpread into the northern provinces, began to be perfectly fettled in the duchies of Lunenburgh, Brunfwick, Mecklenburgh, and Pomerania, and in the archbifhoprics of Magdeburgh and Bremen; in the towns of Hamburgh, Wifmar, Roftock, and along the Baltic as far as Livonia and Pruffia. Luther maintained the doctrine of confubftantiation; and at a general diet at Ratifbon for reconciling both parties, the divines could agree to no more than five or fix articles concerning juftification, free-will, original fin, baptifm, good works, and epifcopacy.

LUTHERN, in architecture, a kind of window over the corniche, in the roof of a building; ftanding perpendicularly over the naked of a wall, and ferving to illuminate the upper ftory.

Lutherns are of various forms, as fquare, femi-circular, round, called bulls-eyes, flat arches, *&c.*

LUTON, a market town, fourteen miles fouth of Bedford.

LUTRA, in zoology. See MUSTELA.

LUXATION, in furgery, is when any bone is moved out of its place, or articulation, fo as to impede or deftroy its proper motion or office. See SURGERY.

LUXEMBURG, the capital of the duchy of the fame name, fituated an hundred miles fouth-eaft of Bruffels, is a fmall but ftrong fortrefs: E. long. 6° 8′, N. lat. 49° 45′.

LYBIA, a name anciently given to all the coaft of Barbary, efpecially that part lying weftward of Egypt.

LYCEUM, in Grecian antiquity, an academy fituated upon the banks of the Iliffus at Athens. It was compofed of porticoes and walks, where Ariftotle taught philofophy; walking there conftantly every day till the hour of anointing, whence he and his followers were called peripatetics.

LYCHNIS, in botany, a genus of the decandria pentagynia clafs. The calix confifts of one oblong fmooth leaf, and the corolla of five unguiculated petals, with a bifid limbus; and the capfule has three cells. There are feven fpecies, three of them natives of Britain, *viz.* the flos cuculi, meadow-pinks, or cuckow-flower; the vifcaria, or red German catchfly; and the dioica, or white campion.

LYCIUM, in botany, a genus of the petandria monogynia clafs. The corolla is tubular, the faux being fhut up by the beard of the filaments; and the berry has two cells. There are three fpecies, none of them natives of Britain.

LYCODONTES, in natural hiftory, the petrified teeth of the lupus-pifcis, or wolf-fifh, frequently found foffile. They are of different fhapes; but the moft common kind rife into a femiorbicular form, and are hollow within, fomewhat refembling an acorn-cup: this hollow is found fometimes empty, and fometimes filled with the ftratum in which it is immerfed. Many of them have an outer circle, of a different colour from the reft.

LYCOPERDON, in botany, a genus of the cryptogamia fungi claſs: It is roundiſh, and replete with farinaceous ſeeds. There are ten ſpecies, ſix of them natives of Britain, *viz.* the tuber, or ſolid puff-balls; the cervinum, or branny puff-ball; the boviſta, or common puff-ball; the ſtellatum, or ſtar puff-ball; the fornicatum, or turret puff-ball; and the pedunculatum, or ſtalked puff-ball.

LYCOPODIUM, in botany, a genus of the cryptogamia muſci claſs. The anthera is double-valved, and ſeſſile; the calyptra is wanting. There are 24 ſpecies, of which ſix are natives of Britain, *viz.* the clavatum, or common club-moſs; the inundatum, or marſh club-moſs; the annotinum, or Welſh club-moſs; the alpinum, or mountain club-moſs; the ſelago, or firr club-moſs; and the ſelaginoides, or prickly club-moſs.

LYCOPSIS, in botany, a genus of the pentandria monogynia claſs. The tube of the corolla is incurvated. There are ſeven ſpecies, only one of which, *viz.* the arvenſis, or ſmall wild bugloſs, is a native of Britain.

LYCOPUS, in botany, a genus of the diandria monogynia claſs. The corolla conſiſts of four ſegments, one of them emarginated; the ſtamina are diſtant; and there are four ſeeds. There are two ſpecies; only one of them, *viz.* the europeus, or water-borehound, is a native of Britain.

LYDIA, an ancient province of leſſer Aſia, in which was the city of Philadelphia.

LYGEUM, in botany, a genus of the triandria monogynia claſs. The ſpatha conſiſts of one leaf; there are two corollæ above the ſame germen; and the nut has two cells. There is but one ſpecies, a native of Spain.

LYING-IN WOMEN. See MIDWIFERY.

LYME, a borough and port-town of Dorſetſhire, E. long. 3° 5′, and N. lat. 50° 44′.

It ſends two members to parliament.

LYMPH, a fine fluid, ſeparated in the body from the maſs of blood, and contained in peculiar veſſels.

Dr Keil ſays, that the lymph being chemically examined, will be found to contain a great deal of volatile, but no fixed ſalt, ſome phlegm, ſome ſulphur, and a little earth. The uſe of the lymph, he obſerves, may be gathered from the conſideration of the parts into which it diſcharges itſelf: that which comes from the head, neck and arms, is thrown into the jugular and ſubclavian veins; all the lymphatics which the parts in the cavity of the thorax ſend out, empty themſelves into the thoracic duct; and the lymph from all the reſt of the body, flows to the receptacle of the chyle; ſo that there can be no doubt but its chief uſe is to dilute and perfect the chyle before it mixes with the blood. See ANATOMY, Part III.

LYMPHATICS, in anatomy. See ANATOMY, p. 308.

LYNN-REGIS, a port-town of Norfolk, ſituated at the mouth of the river Ouſe, on a bay of the German ſea, thirty-two miles weſt of Norwich.

It ſends two members to parliament.

LYNX, in zoology. See FELIS.

LYONS, the capital of the Lyonois, a province of France, bounded by Orleanois and Burgundy on the north, by la Breſſe and Dauphine on the eaſt, by Languedoc and Guienne on the ſouth, and by another part of Guienne and Orleanois on the weſt. This city lies upon the confluence of the rivers Rhone and Soan, in E. lon. 4° 55′, and N. lat. 5° 50′. Next to Paris, it is eſteemed the place of greateſt trade in France.

LYRA, in ichthyology. See CALLYONIMUS.

LYRE, a muſical inſtrument of the ſtring-kind, much uſed by the ancients.

LYRE, in aſtronomy. See ASTRONOMY, p. 486.

LYRIC, in general, ſignifies ſomething ſung or played on the lyre: but it is more particularly applied to the ancient odes and ſtanzas, anſwering to our airs and ſongs, and may be played on inſtruments. This ſpecies of poetry was originally employed in celebrating the praiſes of gods and heroes, though it was afterwards introduced into feaſts and public diverſions.

LYSIMACHIA, in botany, a genus of the pentandria monogynia claſs. The calix is rotated; and the capſule is roundiſh, with a ſharp point, and contains ten valves. There are eleven ſpecies, five of them natives of Britain, *viz.* the vulgaris, or yellow willow-herb; the thirſiflora, or tufted looſe-ſtrife; the nemorum, or yellow pimpernell of the woods; the nummularia, or money wort; and the tenella, or purple money-wort.

LYTHRUM, in botany, a genus of the dodecandria monogynia claſs. The calix conſiſts of twelve ſegments, and the corolla of ſix petals inſerted into the calix; and the capſule has two cells, and many ſeeds. There are ten ſpecies, two of them natives of Britain, *viz.* the ſalicaria, or purple ſpiked looſe-ſtrife; and the hyſſopifolia, or ſmall hedge-hyſſop.

END OF THE SECOND VOLUME.

ERRATA.

End of the article CATASTROPHE. For *See* Epic *and* Dramatic *compositions*, read, *See* Composition.

CHEVRON. Read *Plate LXV.*

CIRCUMDUCTION. For *addigeamus*, read *alledgeances*;—and for *Pobation*, read *Probation*.

DECLINATURE *of judges*. For *legal obligation*, read *legal objection*.

Page 424. column 2. line 39. For *fig.* 31. read *fig.* 3.

P. 425. col. 1. In paragr. 4. there ſhould have been a reference to *fig.* 6.—N. B. In any Treatiſe, or long article, illuſtrated by plates, when a figure is referred to without repeating the N° of the plate, let it be underſtood that the plate laſt mentioned is meant.

P. 426. col. 1. l. 35. For *fig.* 9. read *fig.* 3.—N. B. Fol. 425 & 426 are, by overſight, twice repeated.

P. 429. col. 1. l. 41. For *Fig.* 5. read *Fig.* 3.

P. 437. col. 2. l. 12. For *gait*, read *gate*.

DIODON. Omitted the reference to the figure, *viz.* Plate LXVIII. fig. 4.

DIPONDIUS. For *two ſparrows*, read *five ſparrows*.

DRACO. Omitted to refer to Plate LXVIII. fig. 5.

ECHENEIS. Omitted to refer to Plate LXXIV. fig. 4.

P. 477. col. 1. l. 43. For *Plate LXXV.* read *Plate LXXIV.*

P. 616. col. 1. l. *ult.* Read *Plate LXXX. fig.* 3.

P. 684. col. 1. By miſtake Florida is placed under the Spaniſh empire, and Canada under that of France; whereas they were both ceded to Britain by the late treaty of peace.
